Members of lineages and kinship groups lived close to one another—in the same district, in the same neighborhood, on the same street, around the same tower. In fact, communes consisted of family clusters; in 1378, for instance, the Strozzi of Florence had thirty-five separate households in the same area. Some lineages mimicked communal organization, electing their own officers and having their own military society. The adoption of a surname or family name reflected the importance of the lineage as a community bound by blood. By 1427 one-third of household heads in Florence had surnames. Artisans, however, were less likely than the urban elite to have surnames and less likely to emphasize lineage and kinship.

Frequent visiting among family members and the sharing of food and drink reinforced the solidarity of the lineage and kinship group. One source of reinforcement for the lineage and kinship group was the practice of holding dinners to mark births, baptisms, marriages, and burials within the conjugal family. Communes, through sumptuary legislation, consistently tried to limit the ostentation and opulence of these celebrations, which were intended to signify the family's status and importance.

Family structure was essential for communal growth and maintenance. Many business ventures of the commercial revolution were family-based. The conjugal family eventually became the fiscal unit for communal taxation, and communes depended heavily on the wealthier families and lineages for financial support. Some communes required families to send representatives to religious processions and celebrations. The parties and factions of communal politics were based on families and lineages. Despite the growth and authority of communal government, families still maintained public peace. Although the vendetta—which had come down through its German antecedents—was sharply curtailed, vendettas still occurred and indeed were expected. As late as the sixteenth century, the sculptor Benvenuto Cellini had no qualms about killing his brother's killer; in fact, he saw this as his duty and as a way to salve his grief.

For medieval Italians, family structure denned their place and status in society. Moreover, it provided them with rules and boundaries in their private and public lives.

Farfa

The abbey of Farfa is about 25 miles (40 kilometers) north-northeast of Rome, in the Sabine hills. The name derives from the Farfa River and was not applied to the abbey until the late tenth century. The monastery was founded c. 680-700 by Thomas of Maurienne, who rebuilt a sixth-century church. The abbey received early support from Duke Faroald of Spoleto and a papal privilege from John VII (705). Before 774 Farfa had acquired large amounts of land in the Sabina and the Marche and enjoyed the ongoing patronage of the dukes of Spoleto as well as the Lombard kings.

After the Frankish conquest of the Lombard kingdom in 774, Abbot Probatas steered Farfa into the Carolingian camp. As early as 775, Farfa received a confirmation of its holdings from the new king, Charlemagne; this was the first of perhaps thirty-three royal and imperial privileges granted to it in the eighth and ninth centuries. The Carolingian kings and emperors generally defended Farfa's properties and liberties, particularly against the papacy. Several emperors visited Farfa, and a palace was built there especially for such visits. The monastery was at the height of its early wealth and power in the mid-ninth century, when it had extensive holdings in lands and churches throughout central Italy and probably also in the city of Rome.

Like the other great monasteries of central Italy—Monte Cassino and San Vincenzo al Volturno—Farfa was overrun by Saracen raiders in the late ninth century, and in 897 the monks abandoned the site. Subsequently, perhaps in 905, the monastic complex was burned down by Christian looters. Monks did not return to Farfa until the 930s. With the restoration of the empire under Otto I, Farfa once again came under imperial patronage and protection. However, not until the abbacy of Hugh (998-1039) did the fortunes of the abbey return to the level they had reached in ninth century. With the help of Odilo of Cluny, Hugh implemented effective reforms at Farfa, and he vigorously defended Farfa's rights and properties. Hugh increased Farfa's economic base in

the Sabina and held off threats from the Roman nobility, especially the Crescenzi (or Crescentii) and the Ottaviani. Farfa, the Crescenzi, and the Ottaviani were neighbors and sometime opponents in Rome, where both families were based in the ruins of the Terme Alessandrine between Piazza Navona and the Pantheon.

Farfa was at the height of its later wealth and power in the second half of the eleventh century under the abbacy of Berard I (r. 1048-1089). Berard succeeded in obtaining both imperial and papal support early in his rule; he received confirmations of privileges from Emperor Henry III in 1050 and from Pope Nicholas II in 1060, when the pope visited Farfa to consecrate altars to the Savior and the Virgin. Nicholas II also defended Farfa against the depredations of the Crescenzi and Ottaviani in the Sahina. By the time of Emperor Henry IV, Farfa had become a staunch supporter of the emperor and an opponent of Pope Gregory VII. Henry had visited Farfa in 1082, and Abbot Berard had been with the emperor at the siege of Rome in 1083-1084. But Farfa's need for and dependence on imperial support sharpened the threat to its holdings from the local nobility and the papacy in the Sabina, the Marche, and elsewhere.

Abbot Berard II (r. 1090-1099) was by all accounts a poor defender of Farfa's property. As a result of his sumptuous lifestyle and his political incompetence, he squandered Farfa's wealth and the goodwill patiently built up by Berard I. The threat to Farfa's territories led the monk Gregory of Catino to begin the activities that preserved so much of Farfa's documentation for posterity. In 1092, Gregory began the compilation of Farfa's charters in *Regestum farfense*, which was completed some twenty-five years later by his nephew Todinus. Gregory later compiled *Liber largitoribus*, a book of leases and other land transactions; and *Chronicon farfense*, a narrative with documents. Finally, c. 1130, Gregory put together *Liber floriger*, a topographical listing of all of Farfa's holdings. Gregory's purpose in copying these materials was to defend Farfa against all threats, but they are now the principal sources of our knowledge of its history in the early Middle Ages.

Abbot Berard III (1100-1119) was a steadfast supporter of Emperor Henry V and a vigorous defender of Farfa's rights, but things fell apart after his death. There was a disputed election between Henry's

candidate Berard IV and Guido, who sought support from the papal militia; this resulted in the dispersal of Farfa's monks, treasure, and lands. The Concordat of Worms in 1122 effectively removed Farfa's traditional imperial protection and placed the abbey under the jurisdiction of the papacy. Papal representatives removed Guido in 1125 and installed Adenolf as abbot. Adenolf consolidated Farfa's diminished economic base; he also played a role in the international ecclesiastical scene as a friend of Bernard of Clairvaux and Pope Eugenius III, who was consecrated at Farfa,

Frederick I Barbarossa tried to revive imperial ambitions in Italy and specifically at Farfa. He visited the abbey in 1159 and granted it a charter of imperial privilege as late as 1185. Farfa, however, was now clearly dependent on the papacy, and the expansion of the papal state under Innocent III and later thirteenth-century popes made this dependency even more evident. In 1261, Urban IV issued Farfa a privilege that firmly and irrevocably placed the abbey under the Holy See alone.

Farinata Degli Uberti

Manente di Iacopo degli Uberti, better known as Farinata degli Uberti (d. 1264), was made head of the Ghibelline party in Florence in 1239. Farinata was known for his valor and took an active part in the armed struggles between the Ghibellines, who supported imperial rule, and their rivals the Guelfs, who supported the papacy. He contributed to the capture of the Guelfs and their expulsion from Florence in 1248. However, that victory was short-lived, and the Guelfs returned in 1251. Factional strife soon resumed; in 1258, it resulted in the rout of Farinata and his compatriots.

Farinata among the heretics in Dante's *Inferno*. *Opere del diuino poeta Danthe con suoi commend.* Venice: Bernardino Stagnino, 1512. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Farinata sought refuge in Siena, Florence's neighbor and rival. There he enlisted the help of Manfred, the bastard son of Frederick II of Sicily,

and reorganized Ghibelline forces from throughout Tuscany to mount a challenge against the Guelfs. The two sides met in 1260 outside Siena at Montaperti, where the Tuscan Ghibellines, led by Farinata, defeated the Guelfs in what is often described as a massacre. The battle was indeed particularly savage; according to one contemporary account, "every road, hillock, and stream of water seemed a great river of blood." Dante Alighieri went so far as to suggest that the Arbia River itself ran red. In the wake of their decisive victory, the Tuscan Ghibellines met at Empoli, where it was proposed that Florence be completely destroyed. Farinata alone spoke out against such a measure and vowed to defend Florence with sword in hand as long as he lived. He persuaded the council to spare Florence, which then came under the control of the Ghibellines.

However, the Ghibellines' power in Florence waned after Farinata's death in 1264, Manfred's death at the battle of Benevento in 1266, and the consequent decline in imperial power in southern Italy. The Guelf factions soon vented their anger at the Uberti family; and to avenge those who had fallen in the battle of Montaperti, members of Farinata's family were imprisoned and their homes were razed. In 1280, the Uberti were formally expelled from the life of the city by measures taken under the aegis of Cardinal Latino. Later city councils passed resolutions ensuring the perpetual exclusion of the Uberti from participation in civic affairs. Farinata himself was tried and condemned posthumously for heresy because of his adherence to Epicureanism.

Farinata is mentioned by Filippo Villani, Giorgio Vasari, and Benvenuto da Irnola, and he is depicted in all accounts as a brave and wise leader. Even among his critics, he is remembered as strong, elegant, and restrained. Villani, although critical of Farinata, describes him as being of "civil parlance and wise counsel." Farinata is, however, best immortalized in Dante's *Divine Comedy*, where he appears in *Inferno* 10 in the circle of the heretics. Dante, nominally a Guelf, portrays Farinata as arrogant and prideful but nonetheless imposing and intimidating. Farinata rises disdainfully from his tomb among the Epicureans to confront the Guelf pilgrim. During the encounter between the pilgrim and Farinata, the battle of Montaperti, the factional strife between the Guelfs and Ghibellines, Farinata's role at the Council of Empoli, and the final exclusion of the Ghibellines from Florence are

all recounted.

Fazio Degli Uberti

Bonifazio, or Fazio, degli Uberti (c. 1301 or 1305-c. 1367) was a member of a Ghibelline family expelled from Florence in 1267. He was born in Pisa and never lived in Florence, the city of his ancestors, from which he considered himself an exile. Fazio was a court intellectual and a poet; his most important work is an encyclopedic poem called *Il dittamondo*. In 1336, he was in the service of Mastino II della Scala of Verona; in 1346, he was at the court of Luchino Visconti; and in 1358, he was in Bologna at the court of Giovanni Visconti d'Oleggio. Fazio's adopted city was Verona, a bastion of Ghibelline and imperial ideals,

where he probably died.

Fazio's thirty-five poems include *canzoni*, sonnets, and *frottole* dealing with love, religion, politics, and ethics. He composed seven *canzoni* and one sonnet for his mistress, Ghidola (or Ghida), the daughter of Spinetto Malaspina, lord of Lunigiana. Among these, three *canzoni*—*Nel tempo che s'infiora e cuopre d'erba, Io guardo i crespi e i biondi capelli*, and *l' guardo in fra l'erbette per li prati*—are picturesque representations of love and nature in the springtime that recall the Provençal poets and Dante. In all his poems to Ghida, Fazio underscores the emotional and physical effects of love rather than its spiritual or symbolic meaning. There is a "fresh sensuality" (Corsi 1969, 226,238) in his love poems that is mirrored in his joyous celebration of the beauty and pleasures of nature. Contrary to the observations of many critics, therefore, Fazio was not a follower of Dante or of Petrarch.

Fazio's poetry shows that he never wavered from his political and cultural ideals. The political *rime* are characterized by aristocratic dignity. When Fazio praises Ludwig of Bavaria's Italian campaign of 1327-1329 (in *Tan to son volti i ciel di parte in parte*), criticizes Florentine politics (in the *frottola O tu che leggi*), inveighs against Emperor Charles IV of Bohemia (in *Di quel possi tu ber che bevve Crasso*), or laments the demise of Florence (in *O sommo bene, o glorioso Iddio*), he is an ardent supporter of the empire and of the cultural primacy of Florence.

Fazio's greatest achievement was *Il dittamondo* (*Dicta mundi*), which recounts the poet's fictional journey around the world. This poem is divided into six books and is written in *terza rima*. In Book 1, Fazio states his wish to acquire fame by reporting the marvels he will see on his journey. Yet the poet-pilgrim loses his way shortly after setting out. The first night he dreams that Dame Virtue invites him to follow the path of salvation. He then meets the ancient astronomer Ptolemy and, later, the third-century geographer Solinus, who becomes his guide. Together, Fazio and Solinus visit Rome, which appears to them as a weeping, disheveled woman. In Books 1 and 2, Rome narrates her history, from the time of Julius Caesar to that of Charles of Bohemia. In Book 3, the pilgrims' quest for knowledge takes them to Greece, where Fazio reflects on the Hellenistic legacy of Italy. In Book 4, the poet and Solinus visit Asia Minor, Scandinavia, England, France, and Spain. In

Book 5, they travel by ship to Africa; there they meet Pliny, who speaks to them of astrology and the heavens. After visiting several regions of Africa, they travel to Egypt; from there, Fazio and Solinus go to Palestine—in Book 6—in order to see the Holy Sepulcher. There they meet another pilgrim, who narrates important episodes from the Bible.

Dittamondo is often compared to Dante's *Divine Comedy*, but these two works are very different from each other. For Dante, knowledge of the real world is an important means of spiritual salvation, whereas for Fazio knowledge is the aim of his quest. *Dittamondo* is based on contemporary chronicles and medieval encyclopedias, including Brunetto Latini's *Tresor* and Giovanni De Matociis's *Historiae imperiales*. Fazio often revised his poem in order to reflect developments in science; this would explain the gaps in the poem and the fact that it was unfinished at the time of the author's death. Although it is aesthetically uneven, *Dittamondo* is an accomplished poem in the passages that evoke the passion and spirit of Fazio's lyric poetry; an example is the representation of the Florentine and Italian landscape in Book 3.

Having come of age in the second quarter of the *Trecento*, Fazio saw the rise of humanism, and he shared the humanists' enthusiasm for the classical world. At the same time, however, he typified the Ghibelline intellectual during the downward spiral of imperial politics.

Ferrara

Ferrara, a city in the region of Emilia on the Po River, is possibly of pre-Roman origins, but its history is obscure until post-Roman times. In 575, Ferrara was fortified under the jurisdiction of the exarchate of Ravenna, but in the following decades it was taken by the Lombards. In 774, under pressure from the Franks, the Lombard king Desiderius yielded the city to papal control, exercised by the archbishopric of Ravenna. In 988, after a period of independence, Ferrara was awarded by Pope John XV as a feudal grant to Tedaldo, count of Modena and Canossa and a nephew of the German emperor Otto I. Control over Ferrara was reaffirmed by Tedaldo's granddaughter, Countess Matilda, in 1101 by force of arms, although the city was allowed to retain some degree of internal self-government. Rival Guelf and Ghibelline factions soon fought for domination of the city, which between 1158 and 1164 was brought under the control of Frederick I Barbarossa. Following

that, a Guelf resurgence under William III degli Adelardi prompted Ferrara's adherence to the Lombard League. Internal factional strife began between the Este and Torelli families, but by 1240 the Este had established their *signoria* in the person of Azzo Novello, who had defeated Salinguerra Torelli.

Under Azzo and his successors, Ferrara established extensive control in the surrounding region, annexing Modena and Reggio. Obizzo II's son, Azzo VIII, led Ferrara in a war against Bologna in the last decade of the thirteenth century. On the death of Azzo VIII in 1308, Ferrara became the object of a war between the papacy and Venice, which the papacy won in 1309. However, in 1317, papal **rule** of the city ended when the Este faction returned, with some support from the Venetian republic. In 1329, after long negotiations, the papacy finally recognized the Este *signoria*, and the Este were invested with the rule of the city as papal vicars. With this success, the Este family, particularly in the person of Obizzo III, began the artistic blossoming that was to make Ferrara one of the great centers of Renaissance culture.

Castle of the Este Family, Ferrara. Photograph courtesy of John W. Barker.

Duomo, Ferrara. Photograph courtesy of John W. Barker.

The monuments and buildings of Ferrara are celebrated; many of them date from the Renaissance, but some are medieval. The castle was begun in 1385 by Nicholas II d'Este to thwart popular opposition and is one of the best-preserved medieval family fortresses. Under the reign of Albert I, the university was established by papal bull on 4 March 1391. In the same year Albert ordered the expansion of the Schifanoia Palace (begun in 1385); this palace has later Renaissance decorations and now houses the civic museum. The cathedral of Saint George (1135), designed by Wiligelmus, is one of the finest examples of regional Romanesque architecture. Across from the cathedral stands the Palazzo Comunale, built by Azzo Novello in 1243. It has undergone many renovations over the centuries; the facade, for example, was redone in 1375.

A mosaic that once adorned the arch of the high altar of the cathedral contained four verses in Italian celebrating the date of its foundation and naming its benefactor and its sculptor. The text has, however, been a subject of intense debate, because we know it only through two different transcriptions. One transcription claims to be the reading before the restoration of the mosaic after an earthquake in 1571; the other was published in 1713, the year after its destruction. Consequently, while some scholars consider the transcription of the verses inauthentic and thus suspect, others accept it as one of the oldest

literary documents in Italian. Following is the text given in the edition of 1713:

*Il mile cinto trempa cinque nato
fo questo. templo a Zorzi consecrato
fo Nicolao scolptore
e Gliemo fo lo auctore.*

"Born [i.e., built] in 1135, this temple was consecrated to George; Nicholas was the sculptor, and William was the author [i.e., the promoter]." The Nicholas mentioned in the verse may be a student of Wiligelmus; William may be Guglielmo II Marchesella (d. 1146), who was the consul of Ferrara and a promoter of other civic projects.

Fieschi Family

The Fieschi, a powerful Ligurian family, are first recorded toward the end of the tenth century; they were made counts of Lavagna, a small coastal town in eastern Liguria near Chiavari, by Frederick I Barbarossa (r. 1152-1190). Throughout the Middle Ages, the family was one of the most powerful in Genoa by virtue of the extensive lands it held throughout eastern Liguria. Its most important centers were in San Stefano d'Aveto, Torriglia, Casella, Savignone, Crocefieschi, Lavagna, Montebruno, Montoggio, and Varese Ligure. During the thirteenth and fourteenth centuries the Fieschi built or bought numerous castles throughout the region. Most of these are now ruined; the best-preserved are those at San Stefano d'Aveto and Varese Ligure. These castles were built to meet challenges from other powerful clans, notably the Landi, Piccinini, Malaspina, and Visconti (the famous Milanese family).

Members of the Fieschi family were also prominent in the Genoese church, and as early as the twelfth century they dominated the cathedral chapter of San Lorenzo. The family went on to produce one of the most famous ecclesiastical figures of the late medieval period, Sennibaldo Fieschi, who became Pope Innocent IV in 1243. His nephew Ottobono (b. 1205) became Pope Hadrian V for a brief period in July and August 1276 and is mentioned by Dante in Canto 19 of *Purgatorio*. These two men built the splendid church of San Salvatore in Cogorno, one of the purest examples of the Gothic style in northern Italy, which survives today much as it was when first built. There had been a Fieschi church on this site in the twelfth century, but it was destroyed in 1245 by soldiers of Frederick II, who had been excommunicated by Pope Gregory IX and whom Innocent was then trying to depose. The new

church, which Innocent founded in the 1240s, may also have already existed, but the pope had it completely rebuilt and put it under the direct protection of the Holy See rather than the archbishop of Genoa.

The Fieschi had many branches, which were usually anti-imperial Guelfs in allegiance. They were most influential locally in the Genoese civil war of the early fourteenth century, when one family member became a captain of the people.

The medieval history of the Fieschi came to an end in 1547, with an ill-fated conspiracy of Gian Luigi Fieschi against Andrea Doria, who then hunted down members of the family and confiscated their lands. This conspiracy later became famous, when it was recounted by late sixteenth-century and seventeenth-century historians, notably Camerarius the Elder, Ugo Foglietta, and Antonio Mascardi (1591-1640), whose *La congiura del conte Giovanni Luigi de' Fieschi* (Venice, 1629) was soon translated into French and English. In the nineteenth century, Schiller turned the tale into a play. However, the earliest account is in a little-known work by Antonio Cesena, a priest from Varese Ligure in the Aha Val di Vara who appears to have been instrumental in the transfer of Varese from the Fieschi to Genoese rule in the wake of the rebellion. Cesena's *Relatio deUorigine et successi della terra di Varese* was written in the 1550s and provides the only surviving "family history" of the Fieschi.

The ignominy that the conspiracy brought on the family, as well as the low reputation of Pope Innocent IV, tended to blacken the Fieschi name in the eyes of nineteenth- and twentieth-century historians. However, the family was a large one, and many of its members were renowned for their piety—most famously Caterina Fieschi, Saint Catherine of Genoa (c. 1447-1510). Catherine was one of the best-known women mystics of the late medieval period; she was also noted for her charitable works, especially the foundation of the impressive hospital of Pammatone. Her life is well-documented in a nearly contemporary biography. Catherine's legacy includes *The Spiritual Dialogue* and *Treatise on Purgatory*, whose authorship is disputed between several of her followers. These texts record her mystical experiences in detail. Catherine also left four wills, which reveal something of her intentions in founding the Pammatone hospital. As Catherine's life indicates, the Fieschi continued to be prominent in

Genoa into the sixteenth century.

In the modern city of Genoa, little of the history of the Fieschi survives, apart from some impressive tombs in the cathedral of San Lorenzo. The family's main base, a grand villa at Carignano, was pulled down in wake of the unsuccessful revolt of 1547.

Fiesole

Fiesole was originally an Etruscan hilltop stronghold overlooking the Arno River and the plain that would become Florence. Today, Fiesole, with its spectacular views of the Arno valley and Florence, is as an exclusive suburb and a cool summer retreat for wealthy Florentines and foreigners.

The Romans had formal ties with Faesulae, as it was known, at least

by the second Punic war. After the beginning of the second century B.C., Rome dominated the region, and Fiesole remained its most important town. During the early first century B.C. Sulla rebuilt the town; this rebuilding included a theater and temple whose remains have been excavated. Baths were constructed in the first century after Christ and were refurbished in the second century, under Hadrian. The excavations of these sites are now a major attraction of Fiesole.

The Italian wars of the early Middle Ages washed around and over Fiesole, as when the Goth Radagaisus battled Stilicho's Romans in 405 and the Ostrogoths of King Witigis engaged Byzantine armies in the late 530s. Fiesole gained a bishop in 492 and became an episcopal see. The Lombards occupied Fiesole in the 570s. Under the Franks (after 774), the town became the administrative center of the largest county in Tuscany—a territory bounded by Arezzo, Pisa, Volterra, and the Apennines to the north. During this turbulent period Florence, which was relatively unprotected, apparently languished, as its inhabitants sought the safety of the higher ground of Fiesole. By 854, however, under circumstances that are now not well understood, Florence became the seat of the *contado* (hinterland) and Fiesole a relative backwater. This change may have been due to a shift away from the use of Via Cassia, which passed close to Fiesole, as a main corridor northwest from Rome, to Via Francigena, which crossed the Arno about 16 miles (25 kilometers) downstream from Florence. Florence may well have been more appealing to the local counts because of its position on the river.

In the ninth and tenth centuries, Fiesole had greedy bishops and troublesome nobles, but no major conflicts with Florence arose. However, as commerce emerged, beginning in the late tenth century, and petty feuding gave way to commercial development and rivalry, the Florentines struck at Fiesole with a vengeance. Between 1107 and 1113, Prato, Gangalandi, and Montecascoli all fell to Florentine citizen armies as the commune extended its influence and authority. After futile attempts to defeat Fiesole in 1123 and 1124, Florence conquered the town in 1125, and the destruction was terrible. According to the sources, all males were slaughtered, all buildings except the cathedral were destroyed, and the ancient Etruscan walls were thrown down, except for a small portion of the northern circuit. Although Fiesole was

still technically autonomous under its bishop, it would remain a Florentine suburb throughout the Middle Ages and beyond.

The cathedral of San Romolo—this is the cathedral that survived the devastation of 1125—had been completed in 1028 under Bishop Jacopo il Bavaro. As in other Italian Romanesque churches, the capitals from which the nave arcade sprang were taken from buildings or ruins of the Roman era. The bell tower dates from 1213. In 1256, the church was enlarged and embellished, and it underwent further changes during the *Trecento* and *Quattrocento*. Between 1878 and 1883, the cathedral was radically restored to its Romanesque simplicity.

The present-day church of San Francesco occupies part of the site of the ancient citadel, or *arx*, and the medieval castle (destroyed in 1125) on the western promontory of the town. From 1330 on, the monastic complex was home to a branch of Florentine anchorites, but in 1407 Franciscans gained the site and enlarged the church and convent.

Palazzo Pretorio, the seat of secular government, was constructed in the *Trecento* and modified many times thereafter. Along the road from Florence, one passes the church and convent of San Domenico, the local Dominican establishment since 1406; and the *badia* (abbey) *Fiesolana*. The *badia*, originally dedicated to San Pietro, served as the cathedral church of Fiesole until 1026, when San Romolo replaced it, and Camaldolese monks occupied the older complex. Another branch of Benedictine monks displaced the Camaldolese in the 1200s, and Cosimo de' Medici "Il Vecchio" rebuilt the aging church in the mid-1400s, after it had passed to the Augustinian canons.

Fino D' Arezzo

Fino d'Arezzo (fl. c. 1300) was a comic poet in the style of Cecco Angiolieri. Fino studied law at the University of Bologna in the 1290s. His father, Benincasa d'Arezzo, is mentioned in Dante's *Divine Comedy* (*Purgatory*, 6.13-14).

Fino's only extant poem is a sonnet—"Malinconia, merzé!" "*Che vai cherando?*"—found in Codex Vaticano Barberino Latino 3953. It presents a dialogue between the poet-narrator and a personification of melancholy. Its theme and style attest to the popularity and influence of Cecco Angiolieri. In this sonnet, the narrator begs Melancholy for release from his unbearable suffering, thus mocking a popular theme of the love lyric: a poet-lover begging Love for mercy. Melancholy responds that the narrator has not suffered enough and should suffer even more.

Flagellants

The flagellants, also referred to as the *disciplinati*, *verberatori*, and *battuti*, were a penitential movement of the thirteenth and fourteenth centuries practicing public ritual flagellation. A radical strain of the movement became violently anti-Semitic and anticlerical and was condemned by the papacy in 1349.

Scourging emerged as a form of punishment for monks and clerics in the fourth century. During the eleventh and twelfth centuries it gained wide acceptance as a mode of voluntary monastic penance and a way of imitating the suffering of Christ. In the thirteenth century, the church adopted public flagellation as a form of punishment for laymen who had committed crimes of violence against the clergy and were seeking reconciliation. At about the same time, laymen began to use ritual flagellation to demonstrate conversion at public sermons, especially the sermons of preachers who emphasized the imitation of Christ and empathy with Christ's passion. This ritual flagellation was normally performed in a very controlled way: the flagellant whipped himself only on the shoulders and upper back, and only to the point when blood first appeared.

The flagellant movement began in Perugia in 1260. It was initiated by Ranier Fasani, who is sometimes described as a hermit and was possibly a *frate della penitenza*. Ranier was highly regarded in Perugia for his integrity and holiness. For several years he had staged penitential processions through the city and its environs, and in 1260 the commune called on him to organize another such procession, dedicated to ending the civil strife caused by the rivalry between the

Guelfs and Ghibellines. He and the clergy of the city led hundreds, perhaps thousands, of Perugians through the streets, calling for peace and scourging themselves for their own sins, for the sins of their fellow citizens, and for the wrongs they had done one another. Ranier's efforts proved highly successful. The procession brought the desired peace, and such displays were repeated frequently in Perugia.

Ranier's success soon led to imitation in Assisi, Spoleto, and other parts of Umbria. From there the practice spread south to Rome and north to Ferrara and the environs of Venice. Its spread may have been assisted by the predictions of Joachim of Fiore's disciples that a new age of Christian perfection would begin in 1260. Soon there were flagellant bands in the Piedmont, Provence, Alsace, Austria, Hungary, Bavaria, Bohemia, the Rhineland, and Poland. The flagellants had a good effect in Italy, helping to end civil strife in many places, and so were strongly supported by the clergy there. In 1261, Pope Alexander IV offered an indulgence to Bolognese citizens who would flagellate themselves for their sins under the direction of the Hermits of Saint Augustine at the convent of San Giacomo di Savena. Outside Italy, however, clerics were less enthusiastic about the movement.

By the late 1260s, the original attraction of flagellant displays had waned, but devotees of flagellation managed to consolidate by forming confraternities under the direction of local clergy. These confraternities of *disciplinati* flourished throughout the later Middle Ages, especially in Italy and Spain. They were usually small, but their members were drawn from many social classes. Besides promoting civic peace, they devoted themselves to a variety of pious and penitential activities, all centered on public displays of flagellation.

In late 1348, with the advance of the black plague, public flagellation began to be adopted in parts of northern Europe in hope of averting the divine wrath that was believed to have sent the plague. Typically, groups of penitents, organized and led primarily by laymen, would walk from town to town repeating an elaborate ritual for thirty-three and a half days—the number of Christ's years on earth. On entering a town, they would march in procession, singing hymns, to the main church. They would pray to the Virgin inside the church and then go outside, strip to a cloth that covered their waist, kneel, and scourge themselves until blood flowed. As they whipped themselves, they

would sing of the sufferings of Christ and the Virgin, and their leaders would preach to them. Most of this ritual was modeled on the practice of contemporary confraternities of *disciplinatr*, the main difference was that among the flagellants, laymen directed the proceedings.

This new flagellant movement appeared first in Austria and Hungary and spread quickly to southwestern Germany and then to Thuringia and Franconia, where it began to show strong anticlerical tendencies. Clergy who resisted it were attacked. In the Low Countries, the clergy attempted to take control of the movement but were only partly successful. As rumors flew that the Jews were responsible for the plague, these new flagellants also became strongly anti-Semitic. Several massacres of Jews are attributed to their inflammatory preaching.

I he violence and anticlerical character of this radical flagellant movement soon turned the church authorities against it. In October 1349, Pope Clement VI condemned the actions of the flagellants and banned all further public flagellation. Civil authorities responded similarly. Such official disapproval and its own lack of organization caused the movement to dissolve within a year. Nevertheless, small groups of radical flagellants managed to persist secretly, especially in Thuringia. They continued to cause the authorities concern for the rest of the fourteenth century. Some extremists among them reportedly denied the efficacy of the sacraments, asserting instead the salvific power of a baptism of blood as experienced in their ritual flagellation.

By the late fifteenth century, the radical flagellant movement was extinguished. Meanwhile, however, the small confraternities of *disciplinati* that had been established earlier in Italy and Iberia continued to function undisturbed. They survived into modern times, eventually coming to Central and South America with European colonial expansion.

Flags and Banners

A flag or a banner is a piece of cloth that, fixed on a lance or staff, has symbolic significance. Originally, flags and banners had a symbolic value per se; their individual and therefore unique color and shape connected them with their owner. Because of the increased use of flags and the rise of armor after the twelfth century, the symbolic value of these banners was transferred to the emblems depicted on them. Two main forms existed in the Middle Ages. One form was the gonfalon (from Old High German *Gundfano*, "war flag"), which did not bear a

picture; it had a rectangular bunting, ending in stripes. The gonfanon was used up to the twelfth century. The second form was a vertical rectangular banner (from Gothic *bandwa*, "sign"). This either displayed a picture of a saint or was modeled on heraldic figures; in the latter case, it has to be described according to the rules of heraldic blazons. The creation of flags in accordance with blazonry resulted from a necessity for clear identification and distinction.

In addition to their military and sacral functions, medieval flags were part of the *Staatssymbolik* (Schramm 1954-1956) as symbols of power and justice. The flag was the sign of a leader in battle; thus it became a symbol of victory, rulership, and power in Christian iconography. Under a "host-banner," assemblies and courts were held and alliances and agreements were made. The flag also became a symbol of dominion—for example, in *enfeoffment*, a feudal ritual in which a banner-lance was handed over. The ritual of *enfeoffment* was first practiced by German kings during the Ottonian dynasty and was brought to Italy by them. Because rulership is made evident through representation, the handing over of a flag signified the political ability to act, both for the legitimated recipient and for the giver, who bound his vassal to himself with this symbol of investiture and demonstrated his authority in this symbolic act. Through the repetition of such meaningful actions, political traditions were created, and changes in these traditions transformed the symbolic value of the flags.

Historical Evolution

The Roman army used the *vexillum*, a flag that was attached to a crossbar and suspended from a lance; barbarian auxiliary troops had standards in the form of animals, mounted on staffs. Of these the *draco*, a flag made of colorful cloth and consisting of a dragon's head with an open mouth and a long wind cone, became popular in late antiquity. Beginning with the battle of the Milvian Bridge, Constantine the Great used a standard in form of a *vexilium* surmounted by the Christogram; this, under the *labarum*, became the personal standard of the emperor (Eu-sebius, *Vita Constantini*, 1.28-31) and a Christian sign of victory. It was used as an insignia by Constantine's successors in late antiquity and

the Byzantine empire. The Byzantine army had a host-banner and many monochromatic unit flags. Because of their different colors and their use as signals, these flags had organizational and tactical functions, but they were also sacral symbols: they were blessed and were used in combination with crosses, relics, and icons. In addition to military flags, church flags were used for processions and other special occasions. Similarly, the western church adopted the use of processional flags— its own church flags and banners donated by rulers.

Lances carried in battle were the insignia of the Lombard kings. From the seventh to the tenth century, a standard showing a combination of a cross and a bird was used; this was probably modeled on Germanic animal standards and Byzantine cross standards. A custom of the Roman citizens, which went back to late antiquity and corresponded with Byzantine protocol, was the use of the *vexilla Romanae urbis* ("flag of the city of Rome") in a procession for the triumphal entry of a ruler. One such "Roman flag" may be seen in the Lateran mosaic of Leo III, where Saint Peter gives it to Charlemagne, who has been welcomed into Rome with this imperial *adventus* ceremony. The later Carolingians were welcomed in a similar way. This custom was not adopted by the German kings of subsequent periods, but it was adopted by the popes, whose use of flags was influenced by it. The gold-woven gonfalon of the Salians had its origin in the golden flag of the Byzantine emperors; with just such a *fano imperialis totus aureus* or "completely gold imperial flag" (Monumenta Germaniae Historica, SS, 7.754), Guaimar V of Salerno and Rainulf I of Aversa were enfeoffed by Emperor Conrad II in 1038 (this flag was owned by the monastery of Monte Cassino in 1087). The Norman rulers of southern Italy used flags and lance pennants (among them the *draco*) and adopted the golden imperial flag for their investitures, which they received from the popes beginning in 1059.

From the time of Henry VI until the rise of heraldry, two host-banners were used by the German kings and later emperors in their Italian campaigns: an eagle banner, more closely related to the person of the king; and a banner with a white cross on a red background. Beginning with the reign of Pope Innocent III, the papacy claimed the banner with the cross as the flag of the church, modifying it to include the keys of Saint Peter in the cross quarters. From the time of Pope

Boniface VIII on, the banner showed only the crossed keys on red. In the mid-eleventh century, the reform popes adopted a *vexillum sancti Petri* ("flag of Saint Peter"), first as a sign of their support for leaders of enterprises such as the Pataria (Patarenes), for William the Conqueror, and for the southern Italian Normans in their struggle against the Saracens. In the rivalry between emperor and pope for dominion of the feudal system in southern Italy, the "flag of Saint Peter" was interpreted by the pope as a sign of legitimation and investiture with a fief, and by this he claimed the exclusive rights of the emperor. The papacy based its claim to the imperial insignia on the Donation of Constantine.

In 1155, Milan sent three *civilia signa* (civic signs) to Tortona, which had been rebuilt with its help: a trumpet, a flag, and a seal. This event illustrates the role of the flag as a symbol of power in the Italian communes. During the second half of the eleventh century, the symbolic value of a flag for men on a battlefield was connected to ideas of new forms of political organization inscribed in the collective religious memory of a city. The *universitas* of the commune was imagined as the community and its patron saint (Saint Ambrose for Milan, Saint George for Genoa, the Virgin Mary for Pisa, and so on); and the host-banner usually showed the saint's picture to guarantee his or her support in combat. Because it personified the honor of the city, the banner was used in ritualized warfare for gestures of insult and provocation and was planted on a captured site as a sign of victory—a practice adopted during the crusades. Flags captured from an enemy would be hung in the victor's churches as trophies, or a captured flag might be dragged through the dirt and then torn into pieces in a ritual of humiliation. As an integral symbol of a community, standing for freedom and internal peace and defended by consensus, a flag maintained a sensitive equilibrium between the ideals it embodied and reality. When the unity of a commune was threatened by social and political conflicts and divergent parties, its flag served as a reminder for individuals, encouraging them to remain loyal to the collective whole, whose continuity would thus be secured. The flag thus had a political function, legitimating the autonomy of the commune, and it was used at civic rituals such as the swearing-in of a *podestà* or the investiture of the doge of Venice with the banner of Saint Mark.

From the thirteenth century on, the use of flags in communes

reflected the pluralism of their social-political structure and apparently contradicted the ideology of unity. Within a city, the *popolo*, quarters (political divisions), guilds, corporations, confraternities, and parties all had their own flags. The city's army— and in Genoa the crews of the war galleys as well—would be raised according to wards, which were named after the city gates and under whose banners the men rallied. Revolt in a city, such as the *ciompi* rebellion in Florence in 1378, was manifested as a struggle among various flags to determine which would have the highest authority. Flags were incorporated into newly created, complex symbols such as the Milanese *carroccio*, invented in 1039, and the trumpet pennons of the communal heralds. Flags also became a part of new rituals such as Cola di Rienzo's pageants, which were inspired by traditional Roman processions.

The standard-bearer, originally a military concept, now became an honorary office that included political duties. The Carolingians had *signiferi*, "sign-bearers." From the time of Conrad II (c. 990-1039) there was a special standard-bearer for the realm of Italy; under the Salians, this became a hereditary court office, held by the Aledramite family. In the later thirteenth century, and especially in Tuscany, the standard-bearers of the wards in the civic army became communal officeholders with the title *gonfaloniere* (in Latin, *vexillifer*). Beginning in 1289, the supreme office in the *signoria* of Florence was *gonfaloniere di giustizia*, "standard-bearer of justice"; the holder of this office was given custody of the flag of the *popolo*. Similarly, in Venice during the fourteenth century the doge called himself *vexillifer Veneciarum*, "standard-bearer of Venice." From the time of Boniface VIII on, the popes regularly conferred the title *gonfaloniere della chiesa* (or *vexillifer ecclesiae*), "standard-bearer of the church."

Naval flags in the Mediterranean were at first limited to war galleys, but in the thirteenth century such flags were also used by trading vessels. The war fleets of the Italian sea powers adopted the flag system of the Byzantine land forces, and initially ships carried the same banners used on land. In fact, the flagship that carried the Genoese host-banner was called the *galea carroccia*. The flag of a merchant ship showed under whose protection it sailed. In the fourteenth century, the flags of seaports or those of the naval powers to which they belonged were painted as necessary information on Italian portolan charts, which

were intended for practical use on board vessels.

Florence

Until the thirteenth century, Florence (in Italian, Firenze) was a city of minor importance relative to Lucca and Pisa, its neighbors in Tuscany.

Thereafter, it became one of the most populated, economically prosperous, and culturally significant cities in Europe.

Physical Characteristics and Origins

Straddling the Arno River between the Apennine range to its north and the rolling Tuscan hills to its south, Florence and its surrounding countryside (*contado*) are situated in a fertile floodplain that gradually widens as it extends westward from Florence to Pistoia. The Arno is fed by several tributaries as it flows through the Florentine *contado*. From their source in the Apennines, the Bisenzio, the Mugnone, and the Sieve rivers flow southward to empty into the Arno near Florence. The Elsa, Pesa, and Greve—torrents in the spring but dry beds in late summer—flow northwest from their watersheds in the Tuscan hills south of the city to join the Arno on its south bank. The most extensive and largest mountain valleys of the Florentine countryside are the Mugello (the lush Apennine valley north of the city formed by the Sieve) and the Valdarno Fiorentino (the plain of the Arno that extends from Florence to Pistoia). Farther east of the city is the Casentino, the valley formed by the upper Arno as it flows south from its source in the mountains before turning north and then west toward the sea.

Florence. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. 86v, 87r.

The Romans founded the colony of Florence probably around the mid-first century B.C., traditionally c. 59 B.C. Also according to tradition, the Romans established the *colonia* in the spring, perhaps during the *ludi florales* (floral games), thus giving the settlement its distinctive name. For several centuries before the foundation of the city, the Etruscan hilltop town of Fiesole had dominated this part of the Arno valley. From at least the fifth to the second century B.C., this fortified settlement helped control traffic across the Apennines from the Etruscan settlements in southern Tuscany to the Po valley. Earlier traditions had claimed that the Etruscans from Fiesole were the original founders of Florence, but we now know that this was not true. For the Romans, the new *colonia* had important strategic and economic functions. Via Cassia, the second-century Roman road that connected Rome with the Po valley (by way of Arezzo and Bologna), followed the right bank of the Arno. The site of the new settlement in the valley below the Etruscan citadel was a point where the Arno valley was

narrow and where the Mugnone joined the Arno. The Romans established a port at the site, and eventually they built a bridge where the road to Volterra (Via Volterrana) joined Via Cassia. It was an easily defensible location. Near the location of the original Roman bridge now stands the fourteenth-century Ponte Vecchio ("old bridge"). Excavations at the end of the nineteenth century revealed that, like other Roman cities of the Republican period, Florence had a forum (at the site of the present Piazza della Repubblica), an amphitheater, baths, temples, and a *cardo* and *decumanus* (the two principal city streets).

History and Institutions

Late antiquity (200-568). We know very little about the history of the city during the late Roman, Ostrogothic, and Byzantine periods. Christianity most likely arrived along the consular roads (especially Via Cassia), and there existed a very stable Christian community by the fourth century. According to tradition, Saint Ambrose lived in Florence for a year after fleeing Milan in 393 and consecrated San Lorenzo (the first episcopal seat) during his exile. Bishop Zenobius, an early Christian bishop of the city, was later venerated as one of its principal saints. Other cults of saints also emerged in these early centuries, including those of Saint Reparata and Saint Minias (who was said to have been the first Christian martyr of Florence). A Roman army under the command of Stilicho defeated an Ostrogothic army led by Radagaisus between Florence and Fiesole in 405, but the city eventually fell under the sway of the Ostrogoths. During their reconquest of the Italian peninsula, the Byzantines were able to bring Florence into their sphere of influence. They controlled the city until the invasion of the Lombards in the mid sixth century.

Early Middle Ages (568–1115). During the Lombard period (568-774), Florence was a city of less importance than Lucca in Tuscany. Florence did have at least one defensive tower (*gardinghus*) near its eastern wall, and it seems to have been a minor Lombard administrative center, with a duke and *gastald* in residence. In this period, the cult of Saint John the Baptist first emerged as a principal urban tradition.

The Carolingians were dominant from 774 to 875. Charlemagne

incorporated Florence and Tuscany into his growing empire and replaced the Lombard duke with a count, to be assisted by *scabini*. In 825, as part of an imperial policy promoting education throughout the realm, the Carolingian elite called for the establishment of a school at Florence to serve the clergy; there is no proof, however, that the school actually ever existed. Politically, the Carolingian state relied on the bishops residing in the cities, and the bishop of Florence was no exception. Some of the bishops of Florence at this time, such as Donatus and Andrea, apparently received important imperial immunities from fiscal or jurisdictional obligations.

The years 875-1115 were the period from the collapse of the Carolingian state to the emergence of the urban commune. In the century and a half after the disintegration of the Carolingian state, several political forces held sway in Tuscany and Florence. The office of the marquis of Tuscany, which had emerged in the ninth century, was theoretically subordinate to the German emperors during the tenth and eleventh centuries. However, in actuality the marquis became the ruler of Tuscany, especially under the house of Canossa (1027-1115). During the early tenth century, to counterbalance the power of the marquis, the kings of Italy patronized members of the late Carolingian nobility. Some of them became the founders of the Guidi and Cadolingi patrilineages. During the resurgence of imperial claims in Italy after the mid-tenth century, the Saxon emperors continued to promote the interests of these rural power brokers as important political allies and surrogates. The bishops remained important protagonists in Florentine history throughout this period, both politically and economically.

The tenth and eleventh centuries were crucially important in the history of Florentine politics and the Florentine ecclesiastical establishment. By the eleventh century, the baptismal church district (the *pieve*, or parish church equipped with a font) had become the principal unit of ecclesiastical organization in Florence and its *contado*. Furthermore, the marquis (or his family) and the major patrilineages founded important proprietary monasteries in the city and countryside, for religious and economic reasons. Some of those estates had originally been church properties. Among the new monasteries were the Badia in Florence (founded in 978 by Willa, the mother of the marquis Hugh), San Salvatore di Fucecchio (established by Cadolo before 982), and San

Miniato al Monte (founded in 1018 by the bishop). The reform movement in Florence was a very complicated series of attempts by several churchmen and their lay allies in the eleventh century to end clerical marriage, reclaim church properties from lay control, and eliminate simony. The campaign against simony actually emerged only later in the century; it peaked in 1068, when the founder of the monastery at Vallombrosa, John Gualbert (d. 1073), orchestrated the expulsion of Bishop Peter Mezzabarba from the city. The eleventh-century bishops were among the churchmen most active in attempting to reclaim church property from the lay rural patrilineages. The reform party eventually received the enthusiastic support of Countess Matilda, who was an ally of the papacy during the conflict between Emperor Henry IV and Pope Gregory VII.

Among the few urban landlords in the *contado* at this time were the bishopric and the cathedral chapter, and they became natural allies of Matilda as she sought to limit the power of the rural lineages. Theoretically, she was still the principal ruler of Florence and its countryside. Gradually, however, as her power waned, the authority of these urban leaders increased. She began to cede certain jurisdictional rights to the urban elite, whose identity at this time is still unclear. The tenth and eleventh centuries were also a period during which the population apparently began to increase in both city and countryside, putting more and more pressure on city leaders to control major roads and maintain access to the sources of grain. In the first decade of the twelfth century, the city leaders began military operations against some strongholds of rural lords in the Arno valley west of the city. Following these early campaigns there were operations against Fiesole (1125), Montegufoni (1135), Montebuoni (1135), and Monte di Croce (1143-1147). The death of the last Cadolingi (1113) and of Countess Matilda (1115) created a vacuum of power within the city; eventually, this vacuum was filled by the Florentine consular aristocracy.

From the origins of the commune to the primo popolo (1115-1250). The first documented reference to the consulate—the principal governing body of the early commune—dates from 1138. The men who composed the early consulate were mostly knights, though there is evidence that it also included a few merchants. They normally served for one year, and they had the power to negotiate treaties, wage war, or litigate. They presided over the *parlamentum*, the assembly of the people; and over the *gran consiglio* or *consiglio generate del comune* (grand council of the commune), which elected new consuls and had about 150 members. Surviving records indicate that these leaders divided the population of the city into *milites* (armed horsemen) and *pedites* (foot soldiers). It is probable that there were factional disputes within the ruling aristocracy from the earliest history of the consulate.

In the second half of the twelfth century, Emperor Frederick I Barbarossa (r. 1152-1190) attempted to reassert imperial authority over Italy. Meanwhile, the Florentine consulate continued to pursue military campaigns against Figline (1168), Empoli (1182), the Alberti strongholds (1184), and Semifonte (1202). The death of Emperor Henry VI in 1197 led the principal Tuscan communes to form the Tuscan League to resist imperial encroachment. This is also the period in which we find the first evidence of merchant guilds; a document dated 1192 mentions the

consuls of the Calimala (cloth finishers) guild. In 1198, as the fiscal demands of the commune increased, the consulate took over the imperial hearth tax as its own.

To deal more effectively with factional conflicts, a single officer called a *podestà* replaced the twelve consuls as the principal executive in the city sometime after 1190. The *podestà* was usually a foreigner and served one year in office. Among his responsibilities in the early thirteenth century was the resolution of disputes between the emerging rural communes and the bishopric. The legislative councils also underwent a transformation in the early decades of the thirteenth century. The *consiglio generale del comune* increased to 300 members; and by 1229 a *consiglio speciale del podestà o del comune* (special council of the *podestà* or commune), with 90 members, had emerged to operate alongside it. The fiscal demands of the commune became more pressing at this time, as Florence fought a series of wars on the borders of its *contado* with Siena and Volterra. In the early 1230s, pressed to meet its growing expenses, the commune conducted a census for the purpose of taxation.

An intensification of factional disputes within the ruling elite during the first half of the thirteenth century coincided with a resurgence of imperial power under Frederick II (r. 1215-1250). Members of the aristocracy who sided with the emperor to promote their own local interests became known as Ghibellines, and those who tended to side with the papacy became known as Guelfs. According to Florentine tradition, the clash between the Ghibellines and Guelfs began with the murder of Buondelmonte de' Buondelmonti by the Arrighi and Uberti in 1216; however, the terms Guelf and Ghibelline did not appear before the 1240s. The Buondelmonti identified with the Guelf cause, and the Uberti led the Ghibellines. The Uberti dominated the city after 1244, and the natural son of the emperor became *podestà* in 1246. In 1248, the Guelfs left the city to their rivals. The 1230s and 1240s were also decades during which the Inquisition and the bishop pursued Cathars at Florence; supposedly, several Ghibellines were sheltering the Cathars there. In 1250, a Guelf army defeated a Ghibelline army at Figline. The victors thereafter established the regime of the *popolo* in Florence.

From the Prima Popolo (1250-1260) to the prior ate (1282). In the second half of the thirteenth century, Florence was no longer a second- or third-rate Tuscan commune. Its economic importance as a commercial and industrial center made it one of the most prosperous and economically advanced cities in Italy. Furthermore, its growing population (50,000 c. 1200; 90,000 in 1300) transformed it into one of the most populous cities in Europe. This rapid economic and demographic growth had important consequences for the political development of Florence. From the end of the twelfth century on, an increasing number of prosperous nonnobles or members of the *popolo* (especially merchants and guildsmen) demanded more participation in government. They challenged the aristocratic commune for greater access to political offices, thereby exacerbating the existing factional disputes within the ruling elite.

The government of the *popolo* gave upwardly mobile, prosperous nonnobles an opportunity to hold political positions within the commune that reflected their growing economic power. The association of the *popolo*, which had both political and military components, gestated for decades within a "shadow government" before it came to power in 1250. An executive leader called the *capitano del popolo* (captain of the people) led twenty neighborhood military companies,

and twelve *anziani* (elders) were local political officials who apparently handled financial affairs. The first document mentioning a *capitano del popolo* in Florence dates from 1250 (the first captain mentioned anywhere was at Parma in 1244). The existence of a *societas populi* also dates from 1250. In the new regime of the *primo popolo*, the three *consigli del popolo* (councils of the people) functioned alongside the two previously existing communal councils of the *podestà*. The *consigli del popolo* were the *consiglio generale del capitano* (general council of the captain), with 150 members; the *consiglio speciale del capitano o della "credenza "* (special council of the captain or of the "credenza"), with thirty-six members; and the *consiglio del cento* (council of one hundred), charged with financial management. The total number of legislative councils in the city was therefore five. There was no attempt to abolish the *podesteria*, which continued to exist alongside the new executive officer, the captain. For ten years this Guelf regime ruled the city, only to be expelled after the defeat of a Florentine Guelf army by the Ghibelline Sienese at Montaperti in 1260. For the following seven years the Ghibellines controlled Florence, until they were in turn overthrown in 1267 by Charles of Anjou and his Florentine Guelf allies.

As *podestà* from 1267 to 1282, Charles of Anjou was theoretically the ruler of the city. Florence strengthened its economic and political ties with the Angevin regime in Naples and with the papacy, as Florentines served both the Angevins and the papacy as bankers and merchants. However, attempts to reconcile the Guelfs and Ghibellines failed in 1273, and factional disputes within the Guelf elite itself erupted as well (the Adimari feuded with the Donati and their allies the Tosinghi and Pazzi for hegemony in the city). Dispatched by Pope Nicholas III,

Cardinal Latino arrived in late 1279 to bring these conflicts to an end. In 1280, he issued a new constitution for the city, designed to resolve the serious factional problems. In 1281, the commune required those members of the aristocracy known for their factional violence (magnates) to post a security bond; this requirement was intended to encourage them to end their internal disputes. In 1282, the Angevin regime in Sicily was overthrown, and the Florentine guildsmen, who were eager to be rid of interference from the Angevins and the papacy, seized the opportunity to establish a new government more sensitive to their interests.

From the priorate to the eve of the black death (1282-1340). The establishment of the priorate in June 1282 marked a turning point in Florentine political history. It confirmed the rise to political prominence of those members of the elite who also controlled the economic destiny of the city: the guildsmen, particularly members of the Lana (cloth manufacturers, Calimala (cloth finishers, and Cambio (money changers guilds. The principal executive body of the commune was the six priors, each representing one of the six divisions of the city (the commune henceforth was divided into six areas). The priorate submitted legislation to the communal councils for approval. Only guild members could serve as priors or serve on the principal councils of the *popolo*. Assisted by *savi*—"wise men"—from the six districts, the heads of the principal guilds (initially twelve but later twenty-one) chose priors to serve two-month terms.

Between 1284 and 1292, the government of the city fought a war for hegemony in Tuscany with its principal rivals, Pisa and Arezzo. The defeat of Arezzo at Campaldino in 1289 helped ensure that Guelf Florence would remain the dominant commune in eastern Tuscany for decades to come.

The *signoria* (or priorate) of the commune continued to pass legislation so as to end factionalism and violence directed at the *popolo* by the magnates. A law of 1286 identified the status of magnate with knighthood. The passage of the Ordinances of Justice of 1293 by the commune imposed discriminatory civil penalties to prevent and punish acts of violence perpetrated by the magnate houses against one another and against members of the *popolo* or their property. The legislation identified 150 rural and urban lineages as magnate lineages; it also

made membership in a guild a prerequisite for service in the priorate, thereby undercutting knighthood as the principal mark of elite status. The Ordinances of Justice, which had been passed under the leadership of Giano della Bella, also created a seventh prior, the *gonfaloniere di giustizia* (standard-bearer of justice). The *gonfaloniere di giustizia*, as leader of a force of 1,000 men, was responsible for enforcing the judgments of the *podestà* against magnates.

Many magnate clans reacted swiftly against this discriminatory legislation, and in July 1295, they and their allies expelled Giano della Bella from the city. However, between 1295 and 1300, tension within the magnate aristocracy continued to mount; the situation exploded in 1300, when two factions emerged: the *bianchi*, or Whites, led by the Cerchi; and the *neri*, or blacks, led by the Donati. Pope Boniface VIII, who wanted to assert his authority over the city, supported the Blacks and their leader, Corso Donati. The Whites, led by Vieri dei Cerchi, took control briefly in 1301; but they were forced into exile later that year, when Corso Donati returned on the coattails of the papal emissary, Charles of Valois. Among the exiled Whites was Dante Alighieri (1265-1321). Eventually, the Blacks themselves split into feuding factions.

The exiled Whites and their Ghibelline allies implored the German emperors to help them. In the summer of 1312, during his invasion of Italy, Emperor Henry VII did besiege Florence, but he was unsuccessful. The commune later faced a challenge to its territorial power in Tuscany from Pisa, led by the Ghibelline Uguccione della Faggiuola. To deal with this threat, the commune conferred ultimate authority on King Robert of Naples for several years; but in 1315, the Pisans defeated the Florentines in a major battle at Montecatini. The city next faced a threat from the Ghibellines in Lucca, led by Castruccio Castracane. In 1325, the Florentine government again designated an Ange-vin—this time Charles of Calabria—ruler of the city. That year, at Altopascio, the Florentines suffered another defeat, but Castruccio's death in 1328 eliminated the Lucchese menace. Charles of Calabria died the same year.

In 1329, partly in response to these challenges, the ruling elite initiated a number of important political innovations. It replaced the five existing councils with two: a single *consiglio del podestà e del*

comune (council of the *podestà* and of the commune), with 250 members; and a single *consiglio del capitano delpopolo* (council of the captain of the people), with 300 members. In 1321, the city leaders had created the "twelve good men" to assist the priors. They and the "sixteen captains" (*gonfalonieri*) of the military companies served as the two advisory colleges of the priors and also voted on some matters. Finally, the government introduced the *scrutinio*, a scrutiny system for choosing priors and members of the two colleges; to fill these positions, officials drew names out of bags holding the names of eligible men.

From the black death to the ciompi revolt (1340–1380). The generation after 1340 is normally described as a tremendous crisis in the history of Florence. This crisis was demographic (a loss of about 40,000 people from a peak of 90,000 c. 1300), economic (the failure of several large banks, and a sharply reduced demand for finished cloth), and political (the *ciompi* revolt in 1378). Excessive military spending and ongoing problems in the banking industry led the principal power brokers to turn to a dictatorship in 1342. They designated a foreigner, Walter of Brienne (duke of Athens), as ruler or lord (*signore*) of the city; however, he was expelled in 1343. Meanwhile, the Bardi and Peruzzi banking companies collapsed, and conflict erupted between the magnates and *popolani*, with the latter defeating the former.

In the political changes that followed in 1343, the elite divided the city into quarters (instead of the previous sixths), bringing the total number of priors to nine (two for each quarter, plus the standard-bearer of justice). The 300-member *consiglio del capitano delpopolo* and the 250-member *consiglio delpodesta e del comune* remained the two principal legislative bodies. The *signoria* also breathed new life into the Ordinances of Justice. But the economic depression that followed the demographic disasters of the 1340s and the costs of war added to the

city's fiscal burden. Between 1343 and 1378, the commune fought a series of wars against the papacy (the "war of eight saints" of 1375-1378), Milan, and Pisa (in 1362-1364). To meet these expenses at a time of economic dislocation, the commune continued to rely on regressive indirect taxes (*gabelles*). It also raised money increasingly through forced loans (*prestanze*), especially after 1315. The commune consolidated its public debt (*monte di comune*) in 1345.

Unemployment, currency manipulation by communal officials, and a reduction in cloth production inflicted hardships on most of the population of the city. In the summer of 1378, cloth workers—the *ciompi*—overthrew the government and created a new regime that lasted a month and a half. The *ciompi* had many concerns, including their anger over the debasement of the currency by the government and their demand for official recognition of the lower guilds, which they wanted represented in the government. Following the collapse of the *ciompi* regime in the late summer of 1378, the major guilds attempted to restore order. By 1382, after four years of unstable government, a new, conservative regime brought an end to many of the reforms that had been begun in 1378. After 1382, fewer and fewer families had access to seats in the priorate, and political power became increasingly concentrated in the hands of a restricted oligarchy.

Economic Life

Until the thirteenth century, other Tuscan communes, particularly Pisa and Lucca, were more prosperous and more populous than Florence. By the end of the thirteenth century, however, Florence had become one of the most populous cities in Europe and was a principal center of cloth production and banking in the continent. Earlier scholarship on the economy tended to stress the conflicts between the nobles and the *bourgeois*, the city and the *contado*, and the public and private spheres; but recent studies have developed a more nuanced view of Florentine economic history. Historians now acknowledge that the elites consistently sought noble status throughout the history of Florence and that private rights persisted in the city, as in the countryside, during the communal period. Although commerce and industry became crucial to

the economy by 1250, land always remained the principal source of wealth and status for the Florentine elite—as it had been since antiquity. Indeed, the landed nobility always remained the wealthiest group in Florence.

Late antiquity and the early Middle Ages (300-1100). We know very little about the economy of Florence during the first thousand years of its history, because documents are few (relative to the documents from Lucca, for example). In the second and third centuries, Florence had a population of perhaps some 10,000. The decline of Via Cassia as an artery of transportation, the importance of Via Aurelia along the Tuscan coast, and the emergence of Via Francigena (which linked Rome with France by way of Lucca) after the year 800 may help to explain why Florence was of minor economic and strategic interest during the early Middle Ages. However, the Lombards did establish and endow several important monasteries at Florence, although the Lombard elite did not create as many monasteries or patronize as many churches in Florence as in Lucca. During the period when Florence was dominated by the Ostrogoths, Byzantines, and Lombards, the principal source of wealth for its ruling elite (as was also true elsewhere) was rental income, paid by peasant cultivators. In the Roman period, the rural population had tended to live in dispersed, isolated family settlements; but in the early Middle Ages the population began to settle in villages consisting of groups of families. The dominant form of lease that emerged in this period was a written charter called a *libellus*—in Italian, *livello*. It usually required a fixed money payment over a twenty-nine-year period (although many of these leases tended to become perpetual). Church lords leased much of their land through this instrument. By the Carolingian period, the rural aristocracy had acquired a significant number of *livello* contracts, effectively bringing a large share of church property under their control. This was the pattern in Lucca, and probably—though on a smaller scale—in Florence as well. The universal requirement that parishes pay tithes, promulgated by Charlemagne in 813, greatly increased the wealth controlled by the church. In the tenth and eleventh centuries, many of the powerful rural clans acquired tithes either through *libelli* issued by church lords or simply by seizing them.

By the eighth century, the bipartite manor, a lord's demesne and

dependent peasant holdings, emerged as the dominant unit of the agricultural economy. The typical peasant single-family holding—the *mansus*, existing throughout the countryside—also appeared in documents at this time. Obligatory labor was prominent but certainly not universal. From the late ninth century through the tenth, as the Carolingian state disintegrated, the *mansus* and the manor (*curtis*) began to break up as a result of partible inheritance and demographic pressure. The landed aristocrats leased out their demesne land, and labor services had virtually disappeared by the eleventh century. There is very little evidence before 950 for the existence of benefices (land grants in exchange for services) or vassalage in Tuscany, especially in Florence or Siena. As for women, they possessed more property rights before 1100 than afterward. According to Frankish law, a widow was entitled to a third (*tenia*) of her husband's property; in Lombard law, the portion was a quarter (*quarto*). A woman living under Roman law could claim her husband's wedding gift (*donatio propter nuptias*) after his death. Kinship tended to be cognatic, with descent traced through both the male and the female lines. Until the twelfth century, many children carried their mother's name (the matronymic).

Demographic pressure increased in the tenth and eleventh centuries. After the disappearance of the Carolingian state in the tenth century, the German emperors and kings of Italy promoted several late Carolingian noble families to prominence as political allies or even local counts. Among such families in the region around Florence were the Ubaidini, Cadolingi, and Guidi. Gradually, they reconstructed great properties, often at the expense of church lords, particularly the bishop. Labor services were few. To prevent excessive partitioning of family estates, the clans or kindreds developed into patrilineages, tracing their descent back to a single male founder. During the tenth and eleventh centuries, they created proprietary monasteries to serve as administrative centers for their estates and to solidify their lineages and traditions. Among these monasteries were Settimo and Fucecchio (founded by the Cadolingi). The basic unit of the great properties at this time was the *curtis* (manor or estate), consisting of several dependent satellite holdings (each a *sortis* or *mansus*, a single holding). *Castelli* (castles), fortifications that often served as rent collection centers, appeared throughout the countryside in the tenth and eleventh

centuries. In Florence, the bishopric seems to have played an important role in their creation. Many bishops in the eleventh and twelfth centuries attempted to reclaim rural estates that they had lost in the ninth and tenth centuries. Before 1100, there were few urban lords in the countryside, but among them were the bishop and the cathedral chapter. Their estates were located primarily in the river valleys (the Elsa, Pesa, and Sieve). The typical pattern of settlement was the village, consisting of clusters of families.

Later Middle Ages (1100-1400). The Florentine economy flourished in the years 1100-1340. As the population continued to increase in the twelfth and thirteenth centuries, the principal rural lords loosened their hold on the land and tightened their grip on other men. Labor services became virtually nonexistent by 1200, and peasant cultivators continued to pay fixed rents on their perpetual contracts, usually in money. At the end of the twelfth century, landlords began to require oaths of fidelity from their peasant dependants, and they commuted many rents from money to grain. Apparently, this "rent revolution" (Herlihy 1959, 1964, 1968) was an attempt to take advantage of a growing grain market, responding to increasing demographic pressure. The commutations constituted an increase in rents for the peasant cultivator. In the twelfth and thirteenth centuries, rural immigration into the city quickened as population pressures and the need for urban craftsmen escalated. Many of the immigrants, some of whom were quite prosperous, retained their connection to their rural estates (the Cerchi and the Peruzzi are examples). After 1250, most rural and urban landlords were shifting to fixed-term leases in grain to take advantage of rising rents and rising prices of grain.

Throughout Italy during the twelfth and thirteenth centuries, male domination of kinship and property inheritance strengthened and expanded at the expense of women. After 1100, the matronymic disappeared. Women's rights to property declined markedly with the emergence of the commune and the *popolo*. By 1255, Florence, following the example of other communes, had abolished the wedding gift (the *antifactum*) from husbands to wives. At the same time, women's right to inherit property from their husbands diminished. As their dowries became more and more important to the welfare of their families, women experienced further restrictions on their property

rights. Legally, a woman had the right to her dowry if her husband predeceased her, but in practice the dowry often remained within the household of the deceased husband. Furthermore, fathers often disinherited daughters who had received dowries. In 1325, the commune of Florence ruled that while a marriage lasted, all the property of the wife that was not included in the dowry should be considered part of it. All in all, the strengthening of the patrilineage required a marginalization of women.

In the twelfth and thirteenth centuries, Florence became a commercial power, known primarily for banking and cloth-making. The economic prosperity that resulted from these activities catapulted Florence into the forefront of Tuscan (and European) cities. Before the mid-thirteenth century the Florentines imported cloth from the north (Flanders) for finishing, but sometime after 1250 they began producing fine cloth themselves. By 1300, the *Arte della Lana*, the guild of producers of wool cloth, was making about ten times as much cloth as the *Arte di Calimala*, the cloth finishers' guild. Florentine bankers were pioneers in the creation of new instruments of credit, such as the bill of exchange. Some of the most powerful banking companies of the thirteenth and fourteenth centuries were Florentine (the Peruzzi, Bardi, Acciaiuoli, and Mozzi). They became principal creditors and bankers to emperors, kings, and popes; collected taxes for the papacy; helped manage commercial transactions with the Angevin rulers in Naples; and imported grain to the city. Craft guilds first emerge in documents at the end of the twelfth century. The most important were the guilds of the money changers (*Cambio*), wool-cloth manufacturers (*Lana*), judges and notaries (*Guidici* and *Notai*), and wool-cloth finishers (*Calimala*).

In the thirteenth century, the population continued to increase markedly (to 75,000 in 1260; 85,000 in 1280; 95,000 in 1300; and 90,000 in 1338). From its own *contado*, Florence could produce only five-eighths of the grain needed to feed its growing population. Constantly wary of periodic famines, communal officials therefore created, at the end of the thirteenth century, two commissions to supervise the grain supply. The imported grain came from the Romagna and southern Italy (strengthening the political ties with the Angevin kings). To pay for its administrative and military expenses (especially the cost of maintaining security on the roads and access to food supplies), the commune

developed a sophisticated tax system based increasingly, after 1200, on proportional taxation (the *estimo*) and indirect taxes (such as the tax on salt). In the fourteenth century, when military expenses were most pressing, the commune turned to forced loans, eventually consolidating the communal debt in a *monte comune* in 1345.

After the mid-thirteenth century, the *podere* (plural, *poderi*), a consolidated estate with a farmhouse sufficient to support a family, appeared in the countryside. This development, along with a new sharecropping arrangement under which peasant cultivators paid half their produce to their landlord (the *mezza-drid*), was directly connected to the all-important passage of rural land into the possession of urban dwellers. Peasants with small to medium-size holdings received few benefits from these developments. The *podere a mezzadria* was most intense at the end of the thirteenth century and the beginning of the fourteenth, a period when population pressures were fractioning peasants' lands, rural residents were shouldering a heavy tax burden, and a growing number of prosperous urban residents (like the Pazzi, Frescobaldi, and Bardi) were accumulating rural estates.

An economic crisis characterized the period 1340-1400. This crisis in Florence was part of a general situation in Europe as a whole. The population peaked at about 90,000-95,000 in the early fourteenth century and then stopped growing, as the limits of economic expansion in the countryside (relative to the available technology) were reached. The failure of two banking companies—the Bardi in 1343 and the Peruzzi in 1346—was most likely caused by economic and political factors within Florence rather than (as is sometimes held) by a default on loans on the part of the king of England. The black death of 1348, and the periodic epidemics that continued for several decades after it, eventually decreased the population of the city by half. An overproduction of finished cloth, resulting from decreased demand throughout Europe in the wake of this demographic catastrophe, led to severe economic dislocation within the city. Unemployment, currency manipulation by the government to meet expenses, and a sharp reduction in cloth production caused widespread hardship in the second half of the fourteenth century.

In the countryside in the fourteenth century, the *podere a mezzadria* continued to be the dominant form of agricultural exploitation and

continued to spread, moving outward from the suburbs of the city. Prosperous urban dwellers, especially the mercantile elite, continued to buy rural property, a process that some historians call a "refeudalization of the economy." This process began in the late thirteenth century and persisted in the fourteenth and fifteenth centuries. Consequently, land became concentrated in fewer and fewer hands; and as peasant families with small or medium-size holdings lost control of their land, their situation worsened.

The mid-fourteenth century was a turning point for the Florentine economy. In the closing decades of the century, the city achieved a final political subjugation of independent rural communes; this ended the existence of rival local market centers and confirmed the subordination of the rural economy to the interests of the urban elite. Throughout the second half of the century, the worsening impoverishment of the rural population (particularly the sharecroppers), as well as the taxation of the countryside to benefit the Florentine oligarchy, prevented the development of local markets for rural manufactures. This exploitative relationship between city and *contado* in the later fourteenth century drained the countryside of needed resources and limited the ability of Florentine Tuscany to recover from the effects of the black death.

Urban Development

Late antiquity and early Middle Ages (300-1100). The plan of the city of Florence retained its Roman character until the twelfth century. The city was square in shape and surrounded by a wall, with four gates on its north-south and east-west axes. The outer limits of this quadrangle are bounded by three present-day streets (Via Tornabuoni, Via de' Cerretani, and Via del Proconsolo), the Piazza della Signoria, and the river. Like other Roman colonies (*coloniae*), late ancient Florence had a *cardo* and a *decumanus*. The latter was also part of the second-century Via Cassia, the consular road that connected Rome, Arezzo, Bologna, and the Po valley. The first rudimentary bridge over the Arno most likely dated from the first century B.C. The Romans built another bridge at beginning of the second century to join the new Via Cassia. The city had an amphitheater, a theater (first century), and an aqueduct. Roman

centuriation (field patterning) is present west of the city between Prato and Castello. The earliest Christian churches, such as San Lorenzo and Santa Felicita, were located outside the walls but along the consular roads.

During the Byzantine period (c. 532-568), the city population had contracted to as few as 1,000. Several churches, including San Rufillo and Sant' Apollinare, date from this period. During the Lombard era (568-778), the residents built a guard tower (*gardinghus*) on the eastern wall {matching similar towers at Barberino, Passignano, and Cintoia} and several more churches. Those in the Ripoli plain east of the city date from the late seventh century and the early eighth century. Other churches dating from this period include the first baptistery (seventh century), Or San Michele, and San Michele Visdomini.

During the Carolingian era (778-c. 900), the population varied from about 2,000 to 2,500 in the eighth century to 5,000 in the ninth. The Carolingians built a bridge over the Arno in the ninth century, to replace the second-century Roman bridge that had been destroyed in the Gothic wars of the sixth century. Apparently, this ninth-century bridge lasted until 1178. The third circle of walls dates from the late ninth or early tenth century.

In the period from the collapse of the Carolingian state (c. 900) to the emergence of the commune (c. 1100), economic expansion, piety, population growth, and other social and political factors stimulated the construction of new churches and monasteries. These included the Badia (978), San Miniato al Monte (1018-1063), San Apostoli (after 1050), San Pier Scheraggio (1068), San Salvatore al Vescovo (documented 1032), and San Jacopo sopr'Arno. Several of these churches (particularly San Miniato and San Salvatore) are early examples of Tuscan Romanesque, a style that reflected a new interest in recovering Roman architectural patterns. The population grew to 20,000 by the mid-eleventh century, necessitating the fourth circle of walls built during the reign of Countess Matilda. Administratively, the city was divided into four regions named after the gates: Domus, San Pancrazio, Santa Maria, and San Pietro.

Later Middle Ages (1100–1400). From 1100 to c. 1180 the population increased to about 30,000. To enclose the expanding city, communal officials built the fifth circle of walls (the first communal circle) c.

1173-1174, including the suburbs south of the Arno. A new bridge over the Arno, at the site of the Ponte Vecchio, replaced the ninth-century bridge c. 1178. In the early thirteenth century, when the population increased to about 50,000, city officials built several other bridges over the river: Ponte alla Carraia (1218-1220), Ponte alle Grazie or Rubaconte (c. 1237), and Ponte a Santa Trinita (c. 1252). Several new religious orders arrived in the city, acquiring or constructing new churches: Santa Maria Novella (acquired by the Dominicans, from 1221), Santa Croce (Franciscans, 1226-1228), Santo Spirito (Augustinians, from c. 1269), and Santa Trinita (acquired by the Vallombrosans, 1250-1260). Much of the earliest urban development during the thirteenth century was in the Oltrarno (the south bank of the river around San Miniato al Monte, or southward along Via Romana), and on the eastern edge of the city around the gate of San Pier Maggiore. For the most part in the early thirteenth century, the eastern side of the city had many vacant lots. Most of the urban aristocracy (the Visdomini and the Cerchi, for example) lived in stone towers. They often formed family enclaves in certain districts of the city, where they clustered their towers. These towers were held jointly by family members and their kinsmen or allies (*consortes*).

From 1280 to 1400, Florence flourished economically, and the population continued to increase, partly as a result of extensive immigration (to 75,000 in 1260; to 85,000 in 1280; and to 95,000–100,000 in 1300, although it declined thereafter). The appearance of the present city is due largely to extensive planning by the *signoria* (the priorate) at the end of the thirteenth century and the beginning of the fourteenth. However, we should not overemphasize the role of rational planning; some recent studies suggest that urban development (particularly with regard to the history of mills on the river) was more organic than orderly or planned. The plan included a new civic center, the Palazzo dei Priori; and a religious center, the cathedral-baptistery complex. The construction of Palazzo dei Priori required the destruction of Ghibelline towers and the clearing of the space to create a square. To enclose the growing population, the commune began to construct a second circle of communal walls (the sixth circle in all) in 1284 and finished it in 1333. The new walls enclosed Santa Maria Novella and Santa Croce. A new *piazza* (square) in front of Santa Maria Novella was created in 1288.

Increasingly, the commune bought property from the bishop in the northern suburbs of the city, Cafaggio. Widespread leasing of urban real estate (housing and artisans' shops, or *botteghe*) increased sharply at the end of the thirteenth century, after having begun in midcentury in the oldest and most populated parishes. The basic unit of urban development was the *casolare*, a lot on which buildings could be erected. Many *casolari* had houses on them, owned by several proprietors who usually lived in other parishes. Among the principal landlords of the central parishes were the bishop, the cathedral chapter, and the canons of San Lorenzo. The flood of 1333 destroyed all the bridges but one (Ponte alle Grazie). In 1345, Taddeo Gaddi finished a new Ponte Vecchio, on which artisans located their shops.

Art and Architecture

The visual arts of medieval Florence deserve to be understood and appreciated on their own terms, not simply as precursors of the achievements of the fifteenth century. Innovative changes in painting, sculpture, and architecture are clearly evident from the second half of the thirteenth century on. They were not so much a beginning as a culmination of developments that had been decades if not centuries in the making. Such creativity is especially impressive, even startling, when we consider that before 1200 Florence was generally a cultural backwater. Lucca and Pisa had important schools of painting before 1200; in comparison with the art of these centers, Florentine art was essentially derivative. The artists of Florence took their lead from important traditions created elsewhere in Tuscany, particularly Lucca and Pisa. Comparatively little Florentine painting or sculpture survives from before the thirteenth century. This fact is not surprising: Florence was less populous, less wealthy, less important politically, and less developed economically.

At the end of the thirteenth century and the beginning of the fourteenth, however, Florence experienced an explosion of creativity in painting, architecture, and sculpture—especially in the first two areas. Innovative painters and sculptors, influenced by ancient examples, began to portray the world as it appeared to the human eye. This visual

revolution gave them new, unprecedented tools for exploring character and human psychology. For example, in painting there was a gradual trend toward more naturalistic and realistic portrayals of the human form and of landscapes, culminating in the work of Giotto (1267-1337). Although this new style was not universally accepted among Florentine painters, it began a tradition that would dominate western art until Postimpressionism, 600 years later. With regard to architecture, many works of the late thirteenth century and early fourteenth—the Palazzo Vecchio, the cathedral, the massive churches of the Franciscans and Dominicans at opposite ends of the city—still dominate the Florentine skyline today. Historians debate the reasons for this visual revolution in Florence after 1250, but the factors that set Florence apart and contributed to these developments included its tremendous prosperity and population growth; the development of a self-confident ruling class, with extensive landed and mercantile resources, who became patrons of the arts; and a new piety that stressed the humanity and suffering of Christ.

If we want to appreciate these developments in Florence on their own terms, we should avoid being misled by modern notions of art and modern perceptions of the artist. Today, we tend to envision the artist as isolated and alienated; but Florentine artists of the twelfth, thirteenth, and fourteenth centuries were actually craftsmen. Florentine artists usually worked on specific tasks assigned to them as a commission by a patron. For a well-known artist such as Cimabue or Giotto, commissions included the completion of frescoes or crucifixes to adorn churches or monasteries. For lesser-known artists, assignments were mundane and might include decorating household items for everyday use. Regardless of their reputation, all artists depended on patrons for their livelihood. Patrons could be families enriched by banking and commerce, such as the Bardi or Peruzzi; or they could be institutions such as churches, monasteries, guilds, and even the commune of Florence itself. Like other craftsmen, artists (especially painters) joined guilds. However, not until 1314 were painters allowed into the guild of doctors and pharmacists (*Arte dei Medici e Speziali*).

Architecture: Late antiquity and early Middle Ages (300-1100). There are very few visible architectural remains from the Ostrogothic, Lombard, or Carolingian era in Florence; most of the physical remnants

of these periods lie below the present street level. Excavations in the 1980s below Piazza della Signoria uncovered an extensive Roman wool-dyeing complex (perhaps one of the largest in ancient Italy) and several Roman houses from the Republican period. Excavations conducted between 1912 and 1915 below the present Piazza di San Giovanni (cathedral complex) found remains of a second-century house, Roman baths, and portions of the city wall.

The first church of Santa Reparata probably dated from the sixth century. Excavations in 1965–1974 uncovered the remains of this sixth-century church, which stood until the last quarter of the fourteenth century, when it was replaced by the newly completed cathedral of Santa Maria del Fiore (under construction since about 1296) on the same site. The original Santa Reparata had two Romanesque side chapels and was about 48 feet (15 meters) narrower than the present cathedral. Workmen systematically dismantled it as they built the new cathedral during the first three-quarters of the fourteenth century.

The first baptistery was certainly in existence by 897, and it may have been built as early as the sixth century, contemporaneously with Santa Reparata. Most likely, it dates from the seventh century. It stood until the eleventh or twelfth century, when the present building replaced it. Pope Nicholas II was evidently present at a dedication of the baptistery in 1059. The present octagonal baptistery, built with Tuscan marble, was probably completed by 1150.

On the whole, the Romanesque churches of Florence do not have the grandeur, beauty, or magnificence of the eleventh- and twelfth-century churches in Pisa and Lucca. Indeed, the name given to this style by modern art historians—the Pisan-Lucchese Romanesque—indicates that the forms characteristic of Florentine churches in this period were first developed elsewhere. The basilica of San Miniato al Monte was begun by Bishop Hildebrand in 1024 to house the relics of Saint Minias, and was mostly completed c. 1062. San Miniato is outside the city walls, dominating a ridge overlooking Florence on the south side of the river. The interior has a raised presbytery and two side aisles flanking the nave; it is primarily from the twelfth century, but there is an eleventh-century crypt, and the marble pavement of the nave dates from 1207. The tripartite facade, dating from the twelfth century, is of green and white marble with a prominent arcade of five repeating Roman arches

that, like the baptistery, shows clear classical influences. Other Romanesque churches in Florence include San Jacopo sopr'Arno, San Salvatore al Vescovo, and San Piero Scheraggio. Another eleventh century structure is Santi Apostoli, a small church with a nave, two aisles, and a semicircular apse; it was built sometime before 1075.

Architecture: Later Middle Ages (1100-1400). In the early thirteenth century, the cathedrals and civic buildings of Pisa and Lucca still outshone those of Florence. However, this was no longer the case a century later. By that time, Florence, with nearly 100,000 inhabitants, had outstripped Pisa and Lucca in population; and the building projects that took shape in Florence after the mid-thirteenth century were unrivaled in scope and size throughout Tuscany. Several factors contributed to a massive building program at the end of the century—economic prosperity, the patronage of the most powerful guilds and families, a new piety that favored mendicant orders, and decisions by the Florentine government to build new religious and civic centers for the burgeoning city.

The monumental mendicant churches of Santa Croce (Franciscan) and Santa Maria Novella (Dominican) were begun at the end of the thirteenth century. They were inspired by traditions emanating from France (especially Burgundy) and are the two best examples of Florentine Gothic architecture. Built at opposite ends of the expanding city, these two churches attracted the patronage of some of its wealthiest families. Santa Maria Novella had been Dominican since 1221, but the construction of the present structure did not begin until 1279; it was completed in the early fourteenth century and was influenced by Cistercian designs. The western doors of Santa Maria Novella opened onto a spacious piazza where Dominican preachers addressed large crowds. The construction of Santa Croce began in 1295 under the direction of the architect Arnolfo di Cambio (c. 1245 or 1250-1302 or 1305). The large central nave of Santa Croce (more than 330 feet, or 100 meters, long), flanked by wide aisles, accommodated the large crowds who came to hear Franciscan preachers. Prominent families, including the Bardi and the Peruzzi, endowed and embellished the numerous side chapels in the transept area. Whereas Santa Maria Novella had four chapels, Santa Croce had ten.

In 1255, the commune began constructing the palace, otherwise

known as the Bargello, to serve as the seat of the new civic official, the *capitano del popolo*. It became the residence of the *podesta* after 1260. It is an imposing building that resembles a fortress, built to withstand possible attacks on the *capitano* and his officials from the street.

The construction of the Palazzo Vecchio (Palazzo dei Priori), the residence of the civic government of the priors, began in 1299. This is the largest civic palace in Italy and testifies to the wealth of the city, the dominance of its guilds, and the self-confidence of its mercantile elite. Palazzo Vecchio was finished in only eleven years; construction ended with the completion of the bell tower in 1310. The *palazzo* has two main floors above the ground floor. Its fortresslike construction (resembling that of the Bargello) served both to protect the priors from external threats and to demonstrate to the public the awesome power of the priorate. Palazzo Vecchio, with the new Piazza della Signoria below it, was one of two major reference points or anchors of the new urban design for the city developed by the ruling elite; the other was the cathedral complex.

The cathedral complex was developed at the end of the thirteenth century. By this time, Santa Reparata—which had been the cathedral of Florence since at least the twelfth century—was no longer able to accommodate large crowds or represent the grandeur of the prosperous city. The Opera del Duomo had supervised its construction and maintenance until 1331, when the Arte della Lana (the wool guild) became responsible for it. Hence, the ruling elite wanted to build a new cathedral. Arnolfo di Cambio devised plans for this new, larger cathedral, and he probably supervised the construction until his death sometime between 1301 and 1310. Arnolfo was probably responsible for much of the design of the present structure, including the large central nave with two side aisles, divided into four bays. Excavations conducted between 1965 and 1974 indicate that he had also planned an octagonal crossing at the east end. In 1357, Francesco Talenti—who was the supervising architect between 1351 and 1368—completed the bell tower that had been begun by Giotto; Talenti also oversaw the widening of the cupola. Between 1380 and 1420, the architects greatly enlarged the apse and added the three octagonal tribunes radiating from the central dome, which at that point was still uncovered.

Or San Michele (Orsanmichele), constructed in the fourteenth

century, is associated with two of the most outstanding artists of the time: Andrea Pisano (c. 1295-c. 1348 or 1349) and Andrea di Cione (Orcagna, d. 1368). It was originally designed as a granary, and after 1284 it became the first public loggia in Florence. The loggia came to be a public shrine associated with the veneration of a painted image of the Madonna housed inside, credited with miracles in 1292. After 1336, the priors of the city began the construction of a new building to market and store grain, but these functions ended in 1357. Between 1337 and 1359, the architects completed the construction of the multistory building. The confraternity of the Laudesi commissioned Bernardo Daddi to paint another image of the miraculous Virgin in 1347, and in 1352 it commissioned Orcagna to create a tabernacle for this image. In 1359, Orcagna completed the work, which is one of the most beautiful Gothic-inspired artworks in Florence.

Sculpture: Early Middle Ages (600-1100). The earliest surviving examples of Florentine sculpture are in churches or monasteries in the city and countryside and were created for ecclesiastical patrons. One example is a tenth-century pillar of a holy water basin in the church of San Giovanni in Sugana (Val di Greve). An exquisite eleventh-century ivory book cover for the Gospels (now in the Vatican) shows the apostles receiving the Holy Spirit. A pulpit with thirteenth-century bas-relief sculptures was probably completed for the eleventh-century church of San Piero Scheraggio (consecrated in 1068); among the scenes on this pulpit are the deposition from the cross and the Virgin and child. One of the finest examples of twelfth-century Florentine sculpture is the sarcophagus of Bishop Ranieri (d. 1113) in the Baptistry. Its use of green and white marble is reminiscent of San Miniato al Monte,

Sculpture: Later Middle Ages (1100-1400). Before the mid-thirteenth century, Florentine sculptors drew their inspiration from the Romanesque tradition. Between 1250 and 1350, however, four prominent artists revolutionized Tuscan sculpture, and with it Florentine sculpture: Nicola Pisano (fl. 1258–1278), his son Giovanni Pisano (c. 1250-1314), Arnolfo di Cambio, and Andrea Pisano. In sculpture, as in painting, the human form became more naturalistic, and artists developed the ability to tell compelling stories through design, or composition. Nicola, Giovanni, Arnolfo, and Andrea used this heightened naturalism to explore the subtle complexity of human

psychology; influenced by classical examples and by the northern European Gothic style, they broke with many stylized conventions of Romanesque sculpture. Whereas the dominant innovations in painting began in Florence, this revolution in sculpture was associated with Pisa. Of these four artists, only two—Arnolfo di Cambio and Andrea Pisano—worked for any significant time in Florence.

Nicola Pisano came from southern Italy, and he probably worked in the court of Frederick II. The major works associated with him and his workshop—the pulpits in the Baptistery in Pisa (c. 1260) and the cathedral of Siena (c. 1265-1268)—reveal classical and Gothic influences. Most of the known work of Giovanni Pisano, who was more influenced by the Gothic, was done in Siena (the facade of the cathedral), Pistoia (the pulpit of Sant' Andrea, 1301), and Pisa (the cathedral pulpit). Arnolfo di Cambio was an associate of Nicola Pisano and probably worked extensively in Rome for ecclesiastical patrons before moving to Florence sometime after 1280. In Florence during the first decade of the fourteenth century, he completed several figures for the facade of the new cathedral, which was then under construction. These include a Santa Reparata (no later than 1310) and a Virgin and Child; both are splendid examples of his naturalism, which was strongly influenced by classical art. Arnolfo was also an accomplished architect whose basic design for the new cathedral of Santa Maria del Fiore produced the building we see today.

In 1330, Andrea Pisano accepted a commission from the Arte della Calimala (the cloth finishers' guild) for sculptural reliefs of the life of Saint John the Baptist for the south door of the Baptistery of Florence; he completed the work in 1336. His twenty-eight panels are sculptural counterparts of Giotto's frescoes. The reliefs present scenes in the life of the saint that are compositionally coherent and gracefully naturalistic; the bottom eight panels portray the virtues.

Painting. Before the twelfth century Florentine painters were priests, and the dominant artistic influence was undoubtedly Byzantine. A few examples of painting—especially miniatures—survive from this period. Several eleventh-century psalters are extant, such as one commissioned by Abbot Giovanni of the monastery of San Michele in Marturi (between Florence and Siena). In Santa Trinita there is an early eleventh-century crucifix associated with Giovanni Gualberto, the

founder of the monastery of Vallombrosa.

In the twelfth century, the sources first mention laymen as painters. During this century and the thirteenth, the Italo-Byzantine style dominated Tuscan painting. Very little painting remains from the thirteenth century, and even less from the twelfth; but the extant examples show that the dominant feature of the Italo-Byzantine style was otherworldliness: elongated figures, gold backgrounds, striated clothing, and almond-shaped eyes. This unique style probably came to Tuscany from the Norman courts of Sicily; and Pisa and Lucca became the centers from which it was diffused. As in architecture, before the mid-thirteenth century Florentine painters mainly imitated models from Pisa and Lucca.

At the end of the thirteenth century, however, there were startling innovations in Florentine painting, and Florentine artists took new directions. The reasons for these changes are complex. Florentine artists were influenced by new artistic developments in Rome (specifically those associated with Pietro Cavallini), by the continued presence of Byzantine artists in Tuscany, by a mendicant piety that stressed the suffering of Christ, and by the desires of wealthy lay patrons who wanted painting to show a world they could recognize and identify with.

The works of Coppo di Marcovaldo (fl. 1260s and 1270s) and Cimabue (fl. 1250-1300) are indicative of this new direction. Two of Coppo's masterpieces—a Crucifix, now in San Gimignano; and a mosaic image of Christ on the ceiling of the Baptistery in Florence—demonstrate clearly how far Florentine art had departed from the Pisan-Lucchese traditions. Many characteristics of the Italo-Byzantine tradition are still seen, but there are also new elements. In the Crucifix, perhaps influenced by the Franciscans' emphasis on the agonies of Christ, Coppo portrays a figure who is obviously suffering: Christ's head is tilted, his body sags on the cross, and his face evinces pain. The large mosaic figure of Christ (25 feet, or 7.5 meters, high) is part of a Last Judgment (also executed at the end of the century). Here, Christ is a powerful ruler and judge, dividing the dead into the blessed and the damned.

Cimabue, a Florentine artist who was also active in Rome, Assisi, and Pisa, developed the heritage of Coppo di Marcovaldo. Cimabue painted

an Enthroned Madonna and Child (now in the Uffizi) for the high altar of the church of Santa Trinita c. 1285. The complex magnificence of the throne focuses the attention of the viewer on the two central figures: the Madonna and the child whom she holds on her lap and gently embraces with her left arm. Cimabue's Crucifix in Santa Croce (c. 1285) is more naturalistic than Coppo's Crucifix in San Gimignano. Overall, Cimabue represents the end of the Italo-Byzantine tradition in Florence, but his experiments with spatial representation influenced Giotto.

In *Purgatory* (11.94-95), Dante declares that Giotto replaced Cimabue as the principal painter in the land. Giotto was born in the Mugello valley c. 1267 and is first documented in Florence in 1301. The wealthy Scrovegni family of Padua, who were bankers, commissioned his famous cycle of frescoes in the Arena Chapel there; it was completed after 1305 and is considered his masterpiece. With Giotto, the new naturalism reached its fullest development. His figures—for example, those in the Lamentation—are three-dimensional; they live in a recognizable world, and their gestures and expressions reveal emotion and feeling. Giotto was influenced by his predecessors, but he took the earlier developments in Florentine painting farther, exploring with more subtlety the complex nature of human psychology and emotions. His Ognissanti Madonna (c. 1310-1315), commissioned for the high altar of the church of that name, portrays a mother and child who seem three-dimensional and real. Most of the stylistic conventions of the Italo-Byzantine style (such as striated drapery) that were still present in the work of Cimabue have now disappeared. In the 1320s, Giotto completed several frescoes in the Bardi and Peruzzi chapels in Santa Croce, which was then still uncompleted. The Bardi and Peruzzi families— prominent Florentine bankers—had commissioned these frescoes both as a sign of their social status and as an expiation for their sins. The frescoes show scenes from the lives of Saint Francis (in the Bardi Chapel) and saints John the Baptist and John the Evangelist (in the Peruzzi Chapel). Compelling scenes such as the Death of Saint Francis demonstrate Giotto's genius for drama and storytelling; but emotionally, these frescoes are more restrained than those in the Arena Chapel.

Several of Giotto's followers carried his innovative style and visual revolution into the later fourteenth century. Among them were his

pupils Maso di Banco (who decorated the Bardi di Vernio Chapel in Santa Croce, c. 1340), Bernardo Daddi (fl. 1320-1348), and Taddeo Gaddi (fl. 1332-1366). Gaddi's masterpiece was the fresco decoration of the Baroncelli Chapel in Santa Croce, in which he took Giotto's legacy along a more mystical and emotional path. Gaddi's Annunciation to the Shepherds (c. 1332-1338) is famous for its depiction of a night scene.

However, not all fourteenth-century Florentine painters followed Giotto's style. Early in the century, an independent tradition emerged in Florence, associated with the Master of Saint Cecilia (the painter of the Enthroned Saint Cecilia). This style was less dramatic and more decorative than Giotto's. During the second half of the fourteenth century—the years of the black death, financial and political crises, and a shift to fideism and mysticism in philosophy—some Florentine painters moved away from the naturalism of Giotto and his followers and turned back to the Italo-Byzantine tradition. The most important of these artists was the painter and sculptor Andrea di Cione, or Orcagna (fl. 1343-1368). His most impressive work, and the most representative example of these new trends, was the Strozzi Altarpiece, painted in 1354-1357 in the Strozzi Chapel of Santa Maria Novella. It has an otherworldly quality (for instance, Christ occupies no definable real space) that contrasts sharply with Giotto's Ognissanti Madonna, painted forty years earlier. Among other notable works by Orcagna are the tabernacle at Orsanmichele and a series of frescoes in Santa Croce on death, the last judgment, and hell. Orcagna was also instrumental in the design of the new cathedral and the completion of Orsanmichele. Another principal artist in this new trend after the black death was Andrea Bonaiuti, whose Triumph of the Church (1366-1368, in the Spanish chapel in Santa Maria Novella) exemplifies the heavy didacticism of the later *Trecento*.

No new developments emerged in Florentine painting in the last third of the fourteenth century. Artists such as the excellent draftsman Agnolo Gaddi (fl. 1369-1396, painter of the Legend of the True Cross in Santa Croce) were able to please their patrons by applying the multiplicity of styles and features that had been developed earlier in the century. Around 1375, artists again turned to Giotto as a model, setting the stage for the innovations of the early fifteenth century.

Literature and Thought: Thirteenth and Fourteenth Centuries

Lyric poetry and allegory. As Florence became a prosperous and populous city, developed new political institutions, and took its place as a center of painting and sculpture during the thirteenth and fourteenth centuries, it also produced the finest poets and writers in Italy. The troubadour poetry of Provence in the twelfth century focused on *fin'amor*, "love service" to a lady. Some of this poetry stressed an inherent conflict between worldly love service (love of a woman) and spiritual love service (love of God). This tradition spread to the court of Frederick II (r. 1215— 1250); from there, poets later disseminated it to central and northern Italy. Literary traditions from Sicily and Provence shaped the development of Florentine lyric poetry in the early thirteenth century, and there can be no doubt that the growing economic and political connections between Florence and southern Italy (particularly the Angevin kingdom of Naples) facilitated the arrival of this new literature in Florence. Commercial connections with southern France also brought new cultural influences.

Allegorical poetry first emerged in Florence in the mid-thirteenth century. *Detto del gatto lopesco* (144 lines), which is perhaps a parody, tells the story of a journey to the Holy Land that is impeded by worldly (as opposed to spiritual) love. Brunette Latini (1220-1294 or 1295) wrote the three-volume *Livres dou tresor* during his exile in France; he designed it as a collection of all knowledge, particularly in natural science, ethics (virtues and vices), rhetoric, and politics. Brunetto was a notary and was involved in the public life of his city, and he intended this work to serve as a manual for the ruling elite. Throughout it, his concern with rhetoric, so central to the administration of a commune, is a constant theme. Brunetto also composed, but did not complete, *Tesoretto*, a allegorical poem in 2,944 verses (heptasyllabic couplets). In the early fourteenth century, Francesco da Barberino wrote the vernacular prose allegories *Reggimento e costumi di donna* (offering guidelines for the behavior of women) and *Documenti d'amore* (describing the rules of love).

The emergence of the *popolo*, as well as cultural influences from Sicily and Provence, created conditions that facilitated the development

of a vernacular lyric tradition. Among the Florentines influenced by Provençal poetry was Chiaro Davanzati, who produced at least 120 sonnets and sixty *canzoni*. In the second half of the thirteenth century, Ciaccio de'Anguillara wrote a notable vernacular verse dialogue (*Una fermana iscoppai da Cascioli*) between a peasant girl and a man pursuing her. In *Purgatorio* (24.57) Dante mentions for the first time the *dolce stil nuovo*, or "sweet new style" of poetry. Three poets were associated with this tradition: the Boiognese judge Guido Guinizzelli (1230 or 1240-1276), Guido Cavalcanti (c. 1250-1300), and Dante himself. Dante described Guido Guinizzelli as the first illustrious poet of this vernacular style, surpassed, later, only by Cavalcanti and then Dante. A principal feature of the new style was a highly theologized concept of love. Dante's *Vita nuova*—the story of a beloved who leads the poet to salvation—is a culmination of this genre. Other major lyric poets of the fourteenth century are the comic poet Rustico di Filippo (died c. 1300), Antonio Pucci (d. 1388), and Giovanni Boccaccio (1313–1375). Boccaccio modeled his *Amorosa visione* after Dante's *Commedia*.

Prose. By the end of the thirteenth century prose writers had abandoned Latin and were composing almost exclusively in the vernacular. *Cronica domestica* by Donato Velluti (1313–1370) describes the life of a Florentine family. The *Decameron* by Boccaccio, a hundred tales told by survivors of the black death outside the ravaged city, became one of the most important masterpieces of European vernacular prose literature. Franco Sacchetti (c. 1332-1400) also composed a famous collection of prose tales, *Trecentonovelle*, between 1392 and 1397. Only 223 of the 300 tales have survived, however.

Religious literature. The emergence of new traditions associated with lay piety and the mendicant orders brought about new types of religious literature. *Laude*, religious poems of praise usually sung in the new lay confraternities, began to appear in Florence in the early thirteenth century. The Dominican preacher Giordano da Pisa (1260–1311) gave more than 700 sermons in the vernacular between 1303 and 1307 and in 1309; one of his listeners wrote them down as they were being delivered.

Chronicles. The chronicles are among the main primary sources for the political history of medieval Florence, and they bear a strong imprint of the political ideals of the Florentine *popolo*. Ricordano

Malispini, a Gueff, wrote *Istoria fiorentina* after he was exiled following the battle of Montaperti in 1260. His nephew Giacotto took the history up to 1285. This work apparently influenced Dante, especially because it made a connection between ancient Rome and thirteenth-century Florence. Dino Compagni's vernacular chronicle, *Cronica delle cose occorrenti ne' tempi suoi*, written between 1310 and 1312, covered the history of the city between 1280 and 1312. Compagni analyzed the reasons for destructive factionalism in Florence, concluding that pride and avarice (especially in relation to the struggle to control offices in the city) had led to civil war at the end of the thirteenth century and the beginning of the fourteenth. Giovanni Villani's *Nuova cronica* was also written in the vernacular. Villani worked for the company of the Peruzzi, in Rome in 1301 and in Bruges between 1302 and 1307. His work covered the era from the founding of the city to 1348, the year when the author died of the plague. Matteo Villani continued the chronicle from 1348 to 1363, and his son Filippo took it to 1364. Among the later fourteenth-century chronicles were those of Naddo da Montecatini (*Florentine Chronicle*, 1374-1397) and Marchionne di Coppo Stefani.

Education

Early Middle Ages (600-1100), Historians know more about education in Siena and Lucca before the fourteenth century than about education in Florence, since evidence regarding education in Florence is scattered. In Italy, as throughout Europe, education before the twelfth century was almost exclusively an ecclesiastical matter. Apparently, there were schools for the clergy at Arezzo and at Lucca in the eighth century. A Carolingian imperial assembly in 825 called for the establishment of schools for young clerics in eight Italian cities, including Florence, but there is no evidence that the school in Florence ever existed. Several Florentine monasteries were clearly centers of education of the clergy in the early Middle Ages. For example, in the eleventh century the abbot of Passignano commissioned the copying of several religious works. Vallombrosa seems to have had a monastic school (its students included lay children), and Settimo had a library that included works

from the ninth century. In the eleventh century the literate were clergymen, and the nobles often had to rely on the clergy for their official correspondence, as the illiterate noblewoman Ghisla dei Firidolfi mentions in a document from 1067. Lay *magistri* (teachers) first begin to appear in documents in the eleventh century—specifically, in 1021.

Later Middle Ages (1100–1400): Ecclesiastical schools. Until the end of the thirteenth century—which was a turning point in education in Florence, as in its economic, political, and cultural history—virtually all formal education took place in ecclesiastical schools. The fundamental aim of education in ecclesiastical schools was to prepare young men for careers in the church. In 1197, four of the twelve canons of the cathedral were *magistri*, and the term seems to have spread throughout the *contado* in the twelfth century. The cathedral school educated priests from at least the twelfth century on; there is a reference in 1186 to a "School of Saint John" (destroyed in the early fourteenth century). In 1203, the chapter forbade its canons to accept prebends in any school other than that of Florence. Churchmen handled virtually all primary education until the mid-thirteenth century; lay *magistri* do not appear in the documents until after 1275.

An Augustinian school at Santo Spirito became a *studium generale* of theology (similar to a graduate school) in 1287. The schools at Santa Croce (Franciscan) and Santa Maria Novella (Dominican) both date from the early thirteenth century. The *studium generale* of theology at Santa Croce certainly existed by the 1280s and would be placed in the intermediate rank of Franciscan schools in Europe (below the school at Paris, for example). The rebuilding of Santa Croce (begun in 1295) enhanced the prestige of the school, which was already well known for its Bonaventuran Neoplatonism. The Spiritual Franciscans Pietro Olivi and Ubertino da Casale taught there and probably influenced the young Dante. Modern scholars can identify at least forty-five manuscripts in the library of Santa Croce c. 1300 (surprisingly, however, the library contained very little classical literature). Remigio dei Girolami, who believed that all learning should be a preparation for the study of theology, was associated with the school at Santa Maria Novella and may have instructed Dante there in the study of Aristotle. In 1281, this school became a *studium theologiae*, in the intermediate rank of Dominican schools.

Later Middle Ages (1100-1400): Lay schools. In Italy, most ecclesiastical schools had disappeared by the fourteenth century, and this seems to have been true in Florence as well. At the same time as the emergence of the *popolo*, independent and communally supported lay schools developed in northern Italy to meet the growing political, administrative, and economic needs of the region. In Florence, unlike elsewhere in Italy, the commune exerted little control over its educational institutions and offered no subsidies for instruction in the fourteenth century. Education remained private, and there is no evidence that the commune hired any teachers. The earliest mention of a grammar teacher, a *magister Burgensis de grammatical* is found in a document of 1277. The first documented evidence of an independent grammar school dates from the end of the thirteenth century, when a *maestro* Gerard and his assistant agreed to share the income and expenses relating to a school. Grammar schools existed in Florence by the early fourteenth century. According to Giovanni Villani, these schools taught Latin to more than 500 students in 1338. Several well-known Florentines taught at the University of Bologna, which had been founded by the Bolognese commune at the end of the twelfth century and the beginning of the thirteenth. Among them were Accursius (c. 1182-c. 1263), who taught law; and Bene and Buoncompagno, who were grammarians. Most of the earliest humanists in Florence were notaries; they included Brunetto Latini, Francesco da Barberino, and Petrarco di Parenzo. Several of them owned private libraries. For example, Brunetto Latini apparently owned copies of the works of Sallust and Cicero.

Giovanni Villani, in Book 7 of his chronicle, provides some of the best information on education in early fourteenth-century Florence. According to his account, there were three types of schools: those in which boys and girls were learning to read, those in which the *abbaco* (business mathematics, i.e., applied mathematics and geometry to resolve practical problems in commerce and business) was taught, and those in which there was instruction in Latin and grammar. Children usually matriculated in an elementary school at age six and finished their course of instruction at eleven. At that point, parents had to choose whether to send their children to the *abbaco* school for two more years, or to grammar school for four or five years. Research has revealed increasing evidence that literacy in the vernacular was also a

significant subject of instruction. Villani reported that (out of a total population of 90,000) some 8,000 to 10,000 boys and girls were learning to read and write; 1,000 to 1,200 boys were learning the *abbaco*; and between 550 and 600 were studying grammar. Although some scholars have questioned the reliability of these figures, Villani seems to have been accurate; and if he was, Florence had a far larger percentage of students relative to overall population than any other commune in Italy. Girls rarely studied mathematics. Girls from well-to-do families probably learned to read and write from a *maestra*, but girls from a peasant or artisanal background probably learned only basic household management skills. According to Villani, six schools in Florence, primarily for boys, taught mathematics and the *abbaco*. The *abbaco* was one of the most important subjects studied in the fourteenth century, and many of the best teachers of this subject throughout Italy came originally from Florence.

Villani reports that Latin and logic were taught in four schools. This separation of schools according to subject matter— grammar and the *abbaco*—seems to have been unique to Florence. Buoncompagno da Signa (c. 1165—c. 1240), who taught at Bologna, reported that he studied Latin in Florence with a private teacher in the late twelfth century. Grammar and logic were regularly taught by the end of the thirteenth century, and by 1339 there were several large and well-known schools. Grammar students were of three types: non-Latinizing students who were just beginning their study; Latinizers, who studied authors such as Prosper of Aquitaine and Aesop; and "authors students," who were destined to go to the university and were ready to read classical authors such as Horace, Ovid, and Virgil. Surprisingly, advanced intensive study of the classics does not appear to have begun in Florence until late in the fourteenth century.

From the early fourteenth century on, there were also schools of rhetoric, where eloquence in classical languages and in the vernacular was taught. From the early decades of the thirteenth century, many of the most famous teachers of *ars dictaminis*, or rhetoric, had been Florentines (such as Buoncompagno) who taught in Bologna or Arezzo. Instruction in law dates from before the twelfth century and probably continued without interruption thereafter. The education of notaries, who were vital to the administrative life of the city, certainly existed in

the early thirteenth century. After 1250, it was increasingly regulated by the communes throughout Italy, including Florence. By 1334, a prospective notary had to pass three examinations in areas such as Latin grammar and forms of contracts.

Recent scholarship has found that the fourteenth century did not mark a rupture with educational and intellectual traditions. Indeed, there was more continuity than discontinuity between the humanism that emerged at the end of the fourteenth century and the previous traditions of medieval education. Intellectual and cultural influences from the north, as well as a vibrant tradition in Florence of reading ancient authors in the vernacular, help to explain why Florence emerged c. 1400 as a center of Italian humanism.

Flos Medicinae

Flos medicinae (*Flower of Medicine*) or *Regimen sanitatis salernitanum* (*Salernitan Regimen of Health*) is perhaps the most famous surviving text associated with the school of Salerno. It consists of a series of Leonine hexameters, usually in Latin (although vernacular translations were also popular). Several thousand hexameters were collected by De Renzi (1852). These offer simple advice on how to live well, and they may have been intended for easy memorization. Any actual association with the school of Salerno must, however, be regarded as spurious. The verses probably date from the twelfth century through the fourteenth, and their authorship is unknown.

Folgòre Da San Gimignano

Folgòre da San Gimignano (Giacomo di Michele, 1265 or 1275-before 1332) is considered the most elegant and nuanced of the comic poets and is known for his idealized depictions of courtly life. Folgòre, his nickname, means "splendor" or "radiance"—an apt name for a poetic dazzler. Not much is known about his life other than that he was a member of the nobility and served in the Guelph army during the campaign against Pistoia. His literary activity took place mainly in the second decade of the fourteenth century.

Folgòre wrote thirty-two sonnets: fourteen make up *Corona dei mesi* (*Garland of the Months*); eight make up *Corona della settimana* (*Garland of the Days of the Week*); five are part of the incomplete *Corona del cavaliere* (*Garland of the Knight*); four are political; and one laments the demise of courtly customs (*cor-tesia*). In addition, two sonnets of dubious attribution are found in manuscript Vaticano Barberino Latino 3953: *Amico caro, non forisce ogni erba* and *Quando la voglia segnoreggia tanto*.

The three *corone* (sonnet cycles) exhibit Folgore's love of an affluent, genteel lifestyle. They project a vision of an ideal world rather than a nostalgic evocation of the past. The best-known is *Corona dei mesi*, which recounts the activities of a group of friends, a *brigata*, during different months of the year. Modeled on the Provençal *plazer*, the sonnets bombard the reader with catalogs of beautiful objects, pleasurable activities, rich foods, and wines. The introductory sonnet, *A la brigata nobele e cortese*, describes the brigade in chivalric terms, alluding to Camelot and heroes such as Lancelot. Among the activities

described are hunting (in February), fishing (March), jousting (May), and falconry (September). During extremes of hot and cold weather (in January, July, August, November, December) the brigade turns to indoor activities. The affluence and largesse of the brigade are a recurring theme. Avarice, the opposite of courtliness, is mentioned (in September) as if it were the gravest sin, and the brigade (in December) disparages those who have no money to spend. In March, the ideal city is pictured with no churches, monasteries or "crazy priests who tell too many lies and little truth" (*i preti pazzi/c hanno troppe bugie e poco vero*), revealing a keenly felt anticlericalism on the part of Folgòre's brigade. Folgòre's courtly, aristocratic view of life provoked a thirteen-sonnet parody of *Corona dei mesi* by the *giullare* (jongleur) Cenne da la Chitarra, who depicts a quarrelsome, penniless brigade buffeted by poverty and exposure to the elements.

In the four political sonnets Folgòre shows himself to be an ardent Guelf. Particularly powerful is *Eo non ti lodo, Dio, e non ti adoro* (*I do not praise you, God, nor do I worship you*), articulated as an "antiprayer," in which he criticizes God for letting the Guelfs suffer and the Ghibellines triumph over them. In *Cortesia cortesia cortesia chiamo*, Folgòre bemoans the lack of courtly ideals in contemporary society and the triumph of avarice, thus providing evidence that the world evoked in his *corone* is pure fantasy.

Foligno

Foligno (in Latin, Fulgina), a city in Umbria, is situated on Via Flaminia near the routes that lead to Terni, Spoleto, and Perugia. By virtue of its location, it was exposed to frequent devastation. In the later Middle Ages, it was contested by Guelf and Ghibelline factions; in 1305, the Guelf Trinci family predominated over the Ghibelline Anastasi family. The Trinci remained in power for a century and a half, until Pope Eugenius IV had them suppressed and annexed Foligno to the papal state. Foligno holds an important place in the history of the printing industry in Italy, for it was there, on 11 April 1472, that the first edition of Dante's *Divine Comedy* was printed by Johann Numeister with the help of Evangelista Angelini da Trevi. Before this, early editions of works by Leonardo Bruni (*De bello italico*) and Cicero (*Epistolae ad familiares*) had been published in Foligno.

Saint Angela da Foligno was born in the city in 1248; and Federico Frezzi, the author of *Quadriregio*, served as its bishop in 1404. The cathedral, dedicated to San Feliciano, has a fine Romanesque facade on the north side; it dates from 1133 but underwent major reconstructions

from the sixteenth through the eighteenth centuries. Other early churches include Santa Maria Infraportas (in the Romanesque style, eleventh-twelfth centuries) and the deconsecrated San Domenico (1251), each with an impressive belltower. The Palazzo Comunale was built in the thirteenth century but was completely redesigned and rebuilt in the sixteenth and seventeenth centuries. The palace of the Trinci family, begun in 1389, has a fine courtyard with Gothic staircases and windows.

Folquet De Marsilha

Folquet de Marsilha (d. 1231), the son of a rich Genoese merchant established in Marseilles, is attested to in a document of 1178. In *Trionfo d'amore* (4, verses 49-50), Petrarch writes of *Folco, que' ch'a Marsilia il nome à dato/ed a Genova tolto*: "Folquet, who gave glory to

Marseilles and deprived Genoa of it." Folquet made a name for himself as a troubadour; but since he was, like his father, a rich merchant, he did not visit the courts. In 1195, Folquet and his family entered the Cistercian abbey of Le Thoronet, where he became abbot in 1199. From 1205 until his death, he was bishop of Toulouse, violently persecuting the Cathars, even after having been driven out of his episcopal see into exile. On behalf of the Albigensian crusade he undertook three diplomatic missions to northern France and helped found the Dominican order.

Folquet was a master in the technique of composition and was experienced in dialectic, producing learned poetry that dealt with love in the abstract. Nineteen poems are definitely attributed to him, including two crusade songs and a *planh* (lament) about the death of his lord, Barral de Baux.

Dante, in *De vulgari eloquentia* (2.vi.6), quotes one of Folquet's love poems (*Tan m abelis*) as an example of excellent form. In the *Divina commedia* he places Folquet, as the only troubadour in *Paradiso* (9.64-108), in the heaven of Venus among the *spiriti amanti*, calling him (verse 69) *Qual fin balasso in cbe lo sol percuota*, "that fine ruby struck by the sun." However, remembering Folquet's calls for a crusade to the Holy Land and to Spain, Dante also makes him criticize the neglect into which the cause of the Holy Sepulchre fell, as well as the pseudoscientific preoccupations of the contemporary clergy.

Forlì

Forlì (in Latin, Forum Livii) is situated in the Emilia-Romagna plain, near the Montone, Ronco, Uniti, and Savio rivers. The area around Forlì is a prehistoric site with artifacts from the bronze and iron ages. The site of the city was founded by a Gallic-speaking people in the second century B.C., but shortly thereafter it was conquered by the Romans, who made the town the capital of the province. Remnants of Forlì's Roman past survive in the form of baths, pottery workshops, and artworks.

In the early medieval period, Forlì was part of the exarchate of Ravenna, but in 1058 it defeated Ravenna in battle and became a free commune, which was, however, identified with the Ghibelline party. During the twelfth century, the city vied with Faenza for domination of the province, as well as with Venice, Bologna, Florence, and the papacy. Forlì had a hand in the victory of Emperor Frederick II over Faenza in 1241, and it maintained its fierce Ghibelline stance after the emperor died in 1250. Forlì participated in two other especially notable victories. In 1275, the combined armies of Forlì and other Ghibellines from Romagna, under the command of Guido da Montefeltro, defeated Bologna and Malatesta da Verucchio at the Procolo bridge. In 1282, the people of Forlì broke a siege of their city and, again led by Guido da Montefeltro, defeated French and Guelf troops that were commanded by Giovanni d'Appia, Pope Martin IV's representative in Romagna. In this battle, the French army was massacred; Dante describes the

carnage as a *sanguinoso mucchio*, "bloody pile" (*Inferno*, 27.44). It was during this period that the strife between the Orgogliosi and Ordelaffi families began. In 1315, the Ordelaffi became the lords of Forlì; their reign would endure for about 200 years, but not without some interruptions in which rule shifted either to the church or to a free republic.

Forlì has a large central square on which the principle monuments face, most notably the twelfth-century Romanesque church of San Mercuriale. When this church was founded, in the fourth or fifth century, the original basilica—which perhaps served as the cathedral—was dedicated to Saint Stephen. However, in the seventh century the body of Saint Mercuriale, the first bishop of Forlì, was translated here, and the church was rededicated in his honor. In 1173, the original basilica was destroyed by a fire that also consumed a large part of the city; the current twelfth-century edifice was constructed on the site. In the lunette of the central portal is a well-preserved sculpture, *The Dream and Adoration of the Magi*, by a follower of Benedetto Antelami. The floor of San Mercuriale is decorated with mosaics dating from the fourteenth century; the campanile was designed by Francesco Deddi (1178-1180). In 720, the seat of the bishop was moved from San Mercuriale to Santa Croce, whose current edifice dates from the twelfth century but has undergone many transformations since then. A large part of Santa Croce was made over in the fifteenth century, and the facade and nave were completely rebuilt in 1841. Also of interest is the Romanesque church of Santa Maria dei Servi, founded in the last quarter of the twelfth century and rebuilt in the seventeenth and eighteenth centuries.

Formosus, Pope

Pope Formosus (c. 816-896, r. 891-896) was noted for his piety and learning. Formosus was made bishop of Porto by Nicholas I. In 866, he led a sensitive legation to Bulgaria, where King Boris was so impressed that he asked Formosus to become the Bulgarian archbishop. Recalled promptly to Rome (perhaps in disgrace), Formosus embraced anti-Byzantine policies. In 876, Pope John VIII condemned him for canonical and political faults (including ambition), and Formosus retired to Gaul. He was gradually rehabilitated, however; and at the time when he became pope he was once again bishop of Porto. Formosus favored the German cause in Italy and thus earned the enmity of the pro-Gaulish house of Spoleto. Nine months after his death (in April 896) Pope Stephen VI, at the instigation of the Spoletans, exhumed Formosus's body and tried it in the Lateran for abandoning the see of Porto. Formosus's answers were unsatisfactory, and the body was condemned, stripped, ritually mutilated, and then tossed into the Tiber (perhaps in February 897). For years thereafter, Formosus aroused strong feelings; successive popes denounced or upheld the macabre trial.

Liber pontificalis provides little information on Formosus's pontificate, but more on his career under earlier popes. Anastasius gives a positive view of Formosus's personality in a Latin *Vita* of Saint John Calybite. John VIII's hostility is explained in a letter, and Formosus's own letters reflect his international concerns; for both, see Laehr (1928). Mansi records the condemnations under John VIII (1772, pp. 306-308, 346-358); councils held during Formosus's pontificate, with his letters (1773, 101-129); and the synod of 904 rehabilitating Formosus (1773, 221-227). Chronicles covering the issue of Formosus include the *Chronicon* of Reginus of Prum (Kurze 1890) and the *Antapodosis* of Liudprand of Cremona (ed. Pertz 1839). Pamphlets written by clerics whose ordination was called into question by the trial of 897 are an important source (Dummler 1866).

Fossanova, Abbey of

The abbey of Fossanova is situated south of Rome in the region of Lazio, near the town of Priverno. The abbey was founded by the Benedictines in the ninth century and dedicated to Saint Stephen. In 1134 or 1135, Pope Innocent II ceded the abbey to the Cistercians, whose first major project was make the area more healthful by draining the swampy land. They accomplished this by digging a large channel or trench (*fosso*), and from this came the name of the abbey: *fossanova* means "new trench" or "new channel." The Cistercian monks, who

perhaps came from the mother house at Clairvaux in Burgundy, began the construction of the abbey between 1173 and 1187, and its architecture reflects the ascetic style associated with their order; in fact, it is the earliest and perhaps the most important example of Cistercian Gothic architecture in Italy. Pope Innocent III consecrated the abbey in 1208.

The plan of the monastery church is in the form of a Latin cross. The austere style of the Cistercians is evident in the simple facade, which has a portal decorated with Cosmati work and a great rose window in the upper story. The well-lighted interior has a tall nave and two side aisles, divided by fourteen massive pilasters. Some poorly preserved fourteenth- and fifteenth-century frescoes remain in the choir and in the chapels to the left and right of the rectangular apse.

The buildings of the monastic complex, on the right-hand side of the church, are arranged around a rectangular cloister. On three sides the cloister is in the Romanesque style, but the fourth (south) side was rebuilt in fine Gothic forms (1280-1300). The refectory and chapter house are around the cloister; to the south of the monastery complex is an infirmary; to the east is a low porticoed building that served as the guest house. Saint Thomas Aquinas died in a room on the second floor of the guest house, on 7 or 9 March 1274, during his journey from Naples to the Council of Lyon.

Francesco D'Accorso

Francesco d'Accorso (1225–1293) was the eldest son of Accursius and, like Accursius, was a professor of Roman law. In fact, Francesco studied under his famous father, the author of the ordinary gloss on the *Corpus iuris civilis*. Francesco taught at the university in his native city of Bologna from at least 1270 on. In 1274, he was recruited as a legal adviser by Edward I of England, who was then returning home from a pilgrimage to the Holy Land. According to one authority (Panzirolo 1968), the Bolognese threatened to confiscate Francesco's property if he left the city, and so he attempted—unsuccessfully—to transfer his possessions to a friend who was in collusion with him. Francesco's eagerness to enter the king's employ and leave Bologna was probably due partly to a desire to avoid the factional struggles between the Bolognese Guelfs and Ghibellines. He was present at legal proceedings before the king at Limoges in May 1274, and reportedly participated in a disputation at the law faculty in Orléans the same year. A report that he also taught at the university of Toulouse probably pertains to this period, and it may represent merely a repetition of the event at Orleans, attributed to a different city. In any case, Francesco supposedly had to defend some argument against another professor, Jacques de Revigny, who was disguised as a student.

In England, Francesco was described as the king's *consiliarius*, *familiaris*, *secretarius*, and *clericus*. He served Edward in various diplomatic and legal capacities and attended meetings of the royal council, presumably to advise the councillors on legal matters. In 1274–1275, Francesco was one of the king's proctors at a *parlement* of Philip III of France in litigation against a rebel viscount, Gaston VII of Beam. In 1276, Edward commissioned Francesco to adjudicate a

complaint of extortion brought by Jews in Oxford against the local sheriff. Also in 1276, he attended the Michaelmas parliament. In 1278, Francesco acted as one of Edward's proctorial emissaries to the papal curia, where he petitioned unsuccessfully for the postulation of Robert Burnell (royal chancellor and bishop of Bath and Wells) to the archbishopric of Canterbury.

Francesco received considerable rewards from the king: an annual salary of 200 marks, the custody of the manor and castle of Dunster (May 1280), the manor of Martleigh (June 1280), a lifetime pension of forty marks per year (1281), and ultimately a severance payment of 400 marks. The grant of the messuage of Badelkyng by Andrew de Scaccario (May 1275) was perhaps another mark of royal favor. Perhaps Francesco taught civil law at Oxford, but there is no evidence of this. His only connections with Oxford were the royal commission regarding the Jews' complaint, and Edward's offer of the use of Beaumont Manor (the *aula regis*, or king's hall); it is uncertain for what purpose this offer was made. On one occasion Francesco petitioned for the king's favor; he asked Edward to pardon a fellow countryman, Simone Spinelli, for the commission of a homicide.

While Francesco was absent in England, he and his brothers—all associated with the Ghibellines—were condemned to banishment by a new government which had come to power in Bologna in June 1274 and which supported the papacy. In 1282, however, Francesco returned to Bologna, where he was allowed to resume his teaching post and to reclaim his confiscated property after swearing loyalty to Pope Martin IV and to the city's government. Shortly thereafter the Bolognese government passed an edict against the Ghibellines wherein Francesco was specifically exempted from any penalty. In 1286, his full return to public life was signaled by a formal repetition of his oath of loyalty before Bologna's ruling council.

At some point in his career Francesco taught law to Cino da Pistoia. There is an anecdote that Dino da Mugello once substituted for Francesco and had the temerity to criticize some detail in Accursius's ordinary gloss. On his return, Francesco, ever "the true and pious defender of his father's glosses" (according to Diplovatatus), learned of this and insisted on repeating the entire lecture in order to defend his father's teaching. Francesco's reputation as a legal scholar must rest for

the most part on his teaching, since few of his written works survive. Von Savigny (1834-1851) held that most of the writings attributed to Francesco were in fact by other authors. Francesco's most important scholarly work was a *Casus* or epitome of the *New Digest* which begins *Vlpianus iurisconsultus expositurus*; it is available in an early edition (Freiburg im Breisgau, c. 1494) and was included in the Paris edition of 1536 of the *Corpus iuris civilis*. Two *disputationes* by Francesco are still extant, and some *consilia* are attributed to him. Cino noted some of Francesco's opinions in his own works, but he was probably referring to matters heard in lectures, not to separate publications. The extant portion of Francesco's oration before Nicholas III (delivered in autumn 1278) has been edited by Haskins and Kantorowicz (1943).

A story in *Cento novelle antiche* tells of Francesco's proverbial avarice. On his return to Bologna, he was said to have claimed a share of the profits that his former students—now masters themselves—had earned during his absence, and to have supported his request by citing a right accorded in Roman law to absent fathers regarding their sons' property! Although this tale, if even partly genuine, probably recalls some jest, Francesco did find it necessary in 1291 to petition Nicholas IV for absolution from the sin of usury. It seems that both Francesco and his father had lent money to students at interest and had received bribes from students.

Francesco had two wives, Aichina Guezzi and Remgarda di Papazzone Aldighieri. Aichina Guezzi probably joined him for some part of his sojourn in England, because Edward sent her an invitation to do so at royal expense. Nonetheless, Dante immortalized Francesco in the *Commedia* (*Inferno*, 15.110) by placing him in the seventh circle of hell among the sodomites. No other text suggesting this character trait exists. Kay (1978) suggests that Dante did not mean this charge in a literal sense but rather was holding Francesco guilty of "unnatural" opinions: a denial of world rule by the Roman emperor and an exaltation— as evidenced by Francesco's oration—of papal jurisdiction independent of the emperor.

When Francesco died, he was buried next to his father in Bologna. It is said that the two shared an epitaph: *Seplchrvn Acvrsi Glosatoris Legvm Francisci Eivs Filii*, "The tomb of Accursius, glossator of the law, and Francis his son."

Francesco Da Barberino

Francesco di Neri di Ranuccio (Francesco da Barberino, 1264-1348) was a notary, doctor of law, and poet. (He was not related to the illustrious Barberini family.) Francesco was born in Barberino in Val d'Elsa, near Florence. After completing his early education in Florence, he studied at the prestigious University of Bologna to become a notary. He worked in the chancery of the bishop of Florence as a notary from 1297 to 1303—years that were important to his philosophical and literary development.

Francesco's life has some parallels with that of his contemporary, Dante. Francesco was forced to leave his *patria* for political reasons. He sojourned at Padova, Treviso, and Venice. Because of his professional standing, he had access to important cultural and political centers: he traveled to the courts of Pope Clement V in Avignon (as Venetian ambassador), Philip the Fair in France, and King Louis of Navarre. Like Dante, he had great hopes for the coronation of Henry VII, to whom he addressed a Latin epistle. Unlike Dante, however, Francesco eventually returned to Florence. He earned a law degree in Florence in 1315 and practiced law there until his death. In 1322, Florence sent him on an embassy to Pisa.

Ser Francesco was a member of minor church orders. He had five children (Galazzo, Filippo, Antonio, Taddeo, and Raineri) by his first wife and a sixth with his second wife, Barna di Tanuccio Rinieri, whom he married c. 1314. He died in Florence during the black plague of 1348 and was buried in Santa Croce. Because of his civic and legal service, he is remembered favorably in the writings of Filippo Villani and Giovanni Boccaccio.

Francesco's literary production includes miscellaneous rhymes to his lady, Costanza (many of which are lost); *Flores novellarum* (also lost),

which was probably a collection of narrative tales from Provence; *I documenti d'Amore* (Lessons about Love)-, and *Reggimento e costumi di donna* (Rules on Good Behavior for Women). His fame rests on the two didactic treatises—*I documenti* and *Reggimento*. These were probably written during his years of exile: the second part *oil documenti* shows clear Provençal influences. The dates of composition have been much disputed, but *I documenti* was probably begun before 1309 and finished by 1315, and *Reggimento* was finished slightly later, surely by 1320. *I documenti* provides important intertextual clues for dating the composition of Dante's *Comedy*. *I documenti* and *Reggimento* complement and echo each other; *I documenti* is directed at ennobling male behavior, and *Reggimento*, as is clear from its title, is directed toward women. Both were written in the vernacular to be accessible to newly literate bourgeois readers and to serve, in effect, as manuals for admirable social behavior and elegant manners.

I documenti, which is more allegorical than *Reggimento*, is written in Italian verse accompanied by Francesco's own translation and glosses in Latin. Twelve female personifications (Docility, Industry, Patience, Hope, etc.) have here collected various moral and chivalrous precepts that Love dictated to Eloquence. Although the text lacks unity, it is rich in its citations of thirteenth and fourteenth-century literary works. These include works by many Provençal authors as well as minor Italian and French poets who are not known in any other surviving source. *Ser Francesco* also refers to well-known authors such as Dante, Brunetto Latini, Guido Guinizzelli, Guido Cavalcanti, and Dino Compagni,

Reggimento is an early courtesy book composed in a unique rhythmic prose and dedicated to the Madonna. It is less successful than *I documenti* as allegory but is more homogeneous, and it offers delicious glimpses of the domestic customs, behaviors, and interests of women of different ages and social strata. Its epigrammatic rules—sometimes pedantic but always perceptive—address problems such as prenatal care, childhood education, suffering and consolation, witty speech, and piety.

Like other early humanists, *Ser Francesco* was concerned with the physical appearance of his treatise on the page. He himself copied and decorated one manuscript of *I documenti*, and he supervised the

illumination of another exemplar and of an *Officiolo*.

Francesco Da Carrara

Francesco da Carrara (Francesco il Vecchio, 29 September 1325-6 October 1393) was a powerful ruler and a patron of the arts. In 1345, his father, Giacomo, became the *signore* of Padua, and for the next five years Francesco and his uncle Gia-comino assisted Giacomo in the government of the city. Gia-comino was assassinated in 1350, and Francesco and his uncle were then formally elected to the *signoria*; this election began Francesco's thirty-eight-year period of continuous rule.

Francesco was awarded the title *vicario imperiale* (like his father and the other *signori* of the Carrara family before him) and was made a knight of the empire by Emperor Charles IV in 1354. However, Giacomino became envious of his nephew's military power and plotted to kill him; Francesco learned of this plan and had his uncle arrested and imprisoned. In 1355, Ludwig of Hungary invaded the Venetian territories, and Francesco attempted to gain protection from Venice for his own threatened possessions. Venice was not amenable to this, and so Francesco allied himself with Ludwig against Venice, thereby breaking a traditional link between the political interests of Padua and Venice. The Venetian republic, threatened by Francesco's expansionist policies, became more hostile to Padua, and this increased tension was to lead to several wars in subsequent years.

The first of these wars began in 1372; a year later, Francesco was betrayed by his stepbrothers Marsilio and Nicola and was forced to accept a humiliating peace treaty, which included the payment of a huge indemnity of 280,000 ducats to Venice. After this, Francesco became obsessed with taking revenge on the Venetian republic, and further wars occurred in 1378 and 1386. The war of 1386 led to Francesco's downfall, as Venice concluded a treaty with his former ally,

Gian Galeazzo Visconti of Milan. The Paduan territories were divided between Milan and Venice, and Francesco abdicated the *signoria* in favor of his son, Francesco Novello, on 29 June 1388. The elder Francesco was then arrested and imprisoned successively in Verona, in Como, and in Monza, where he died.

Apart from his bellicose adventures, Francesco is also remembered for his patronage of and friendships with prominent Paduan intellectuals of his day, such as Giovanni Dondi dell'Orologio and Petrarch. Petrarch held his patron in high esteem: he dedicated *De viris illustribus* to Francesco, and when he died in 1374 he bequeathed to Francesco a painting of the Virgin by Giotto.

Francesco Di Vannozzo

The poet Francesco di Vannozzo (c. 1340-after 1389) was born in Padua to a family of wool merchants originally from Arezzo. He was forced to leave his native city in 1363, perhaps because of disagreements with Francesco il Vecchio da Carrara, the lord of Padua. He then went first to the court of Cansignorio Delia Scala in Verona (for the wedding of Cansignorio and Agnese di Durazzo); from there, at some unspecified time, he began his pilgrimage as an itinerant poet and jongleur among numerous cities and courts in northern Italy. The few extant documents attest to his return to Padua in 1371, his presence in Venice in 1372, and

his sojourn in Verona in 1375. However, on the death of Cansignorio Delia Scala he returned to the court of Francesco da Carrara at Padua. Francesco may have studied for two years (1377-1378) at the *studium* in Bologna. In 1379, he was back in Padua. There, demonstrating his sensitivity to the political climate in the region, he won favor with the lord of Padua by writing a vituperative poem, a *frottola*—*Perdonime ciascun s'io troppo parlo* ("May everyone pardon me if I speak too much")—in which he inveighs against the Venetian republic, then engaged in war with Padua and its Genoese allies over Chioggia (1378-1381) and over control of the Adriatic coastline. A year later, though, Francesco went over to the Venetian side in this conflict with Padua. His new political position may be observed in his *frottola* *Se Die m'aide, a le vagnele, compar* ("Unless God, in the name of the Gospels, helps me, friend"), where he praises the Venetians for retaking a particular castle (the *castello* delle Bebbe) in 1380 and deplors Francesco da Carrara's treachery.

From 1381 to 1387, Francesco was again in Verona, and it was there that he became acquainted with the poet Gidino da Sommacampagna, with whom he exchanged several sonnets. Once again, however, he was forced to return, briefly, to Padua, because of political changes (Antonio Delia Scala and the Scaligeri family in general fell from power in 1387 following defeats at the hands of Padua and the Visconti). In 1388, the Carrara family had to abandon Padua after their loss to the Venetians in alliance with the Visconti family of Milan; but Francesco di Vannozzo had curried favor with Gian Galeazzo Visconti by writing a cycle of eight sonnets in his honor, *Cantilena pro Comite Virtutum* {*Song for the Count of Virtue*}, in which personifications of Italy and seven Italian cities (Padua, Venice, Ferrara, Bologna, Florence, Rimini, and Rome) pay homage to the Visconti. In addition to his *canzone* on the heraldic crest of the Visconti family (*Pascolando mia mente aldolceprato*), Francesco's *corona di sonetti* gained him a place in the Milanese court. After he went to Milan in 1389, no more is known about his life.

Francesco di Vannozzo's substantial poetic production—consisting of five *canzoni*, four *frottole*, four *ballate*, two madrigals, and 153 sonnets—represents a variety of styles and subjects. His language is a mixture of his native Tuscan and his adopted Paduan, with many dialectal colorations from other northern cities and regions (Venice, Lombardy),

as well as from Occitan and Old French. His poetry is pervaded by proverbs and other popular colloquial expressions. Evidence of his poetic experimentation may be found in the new words he coined; the pluri lingual sonnets he composed; and the *rime composte* (composite rhymes), *traductio* (equivocal rhymes), and acrostics he embedded in his lyrics. Many of his sonnets were written as parts of *tenzont*, and he corresponded with a number of poets, including Gidino, Pietro Montanaro, and Petrarch (who, it seems, never replied). As an itinerant court poet, he often composed lyrics about the difficulties (financial, personal, and ideological) that such a life entailed. He complains, for example, of his attraction to the tavern, to gambling, and to other pleasures of the flesh; and in these complaints he shows himself to be a kindred spirit of two other fourteenth-century poets: Antonio Beccari da Ferrara and Simone Serdini. Francesco also took motifs from the aulic (courtly) tradition and gave them a realistic twist; for example, in the sonnet *Sia benedetto el vespro e 7 predicare* ("May vespers and the sermon be blessed"), he describes his lady fast asleep in church, thus subtly parodying both the style and the subject of some of Petrarch's lyrics. Francesco's *canzone Correndo del Signor mille e trecento* ("In the year one thousand three hundred"), which belongs to the category of poems treating the desolate state of the world, provides an ironic view of sociopolitical conditions in 1374.

Francesco was also a musician, playing both harp and lute. In a series of seven sonnets—beginning with *Liuto mio, deb, quanto pianger degio* ("Lute of mine, how much must I weep")—he presents a dialogue between these two instruments, in which the lute laments the fact that it has been abandoned in favor of the harp. Scholars have found many political references and perhaps even a few autobiographical or quasi-autobiographical elements in his lyrics: for example, the name of his wife Orsolina (*Orsa*) in a sonnet lamenting the fact that "cruel Death" (*despiatata Morte*) has carried her off: *Si come franco e pronto lion forte* ("Just as a bold lion quick and strong"). The variety present in Francesco's lyric corpus makes him one of the more interesting poets of late fourteenth-century Italy.

Francis of Assisi

Saint Francis of Assisi (Francesco di Pietro di Bernardone, 1181 or 1182-1226) was a religious reformer and the founder of the Franciscan order and the Poor Clares.

By some estimates, more books have been written about Francis of

Assisi than about any other person who ever lived. In the twentieth century, for instance, he was the subject not only of historical and religious works but also of literary fiction, movies, songs, and comic books. Nikos Kazantzakis wrote a novel about Francis, and W. E. B. DuBois once gave a commencement speech in which he urged the graduates to make Francis their model. Hermann Hesse and G. K. Chesterton wrote essays on Francis. Adolf Holl called Francis "the last Christian," and the theologian Leonardo Boff described him as the "model for human liberation." In the nineteenth century, to take just one example, Henry Thode (during the 1880s) described Francis as the initiator of the Renaissance.

There was nothing new in the attention given to Francis during the nineteenth and twentieth centuries. The artists who were called to Assisi in the century after his death to decorate his burial church are a who's who of Italian painting: they included, among many others, Giunta Pisano, Cimabue, Pietro Cavallini, Giotto, Simone Martini, and Pietro Lorenzetti. The name Francis was often given to boys, in Italy and beyond, during the fourteenth century. Dante devoted a canto of *Paradiso* to praising Francis. In short, Francis was an extraordinary man who has inspired people of very different ways of life and beliefs ever since he walked the roads of Italy in the early thirteenth century.

Francis was born in the small Umbrian town of Assisi, the son of a prosperous cloth merchant. Almost nothing is known for certain about his youth. Apparently, Francis was renowned for generosity, even for prodigality; and he clearly had an interest in chivalry and military affairs. When he was about twenty years old, he fought in a war between Assisi and its hated neighbor, Perugia. Assisi was defeated, and Francis spent some time as a prisoner of war. Later, he planned to enter the service of Walter of Brienne in Apulia against the Hohenstaufen king and to make a name for himself as a knight. Francis also worked in his father's cloth business, of which he was to be the heir. Literally, Francis did not get very far in his military career—he turned around and returned to Assisi after traveling only a few miles—but he was learning the cloth business, and he enjoyed the social life of wealthy, popular youth.

When Francis was in his early twenties, he began to find solace in solitary prayer in the countryside around Assisi. Soon, he came to

believe that God wanted him to rebuild churches, both by providing supplies and by helping with the reconstruction. Thus far, Francis's father had indulged him, but a crisis came when Francis sold some of his father's cloth and offered the money to the priest of San Damiano, a church in need of repair. The family conflict became a public matter when the bishop was called on to decide between Francis and his father, and this was also the moment when Francis's life crystallized. Francis stripped himself naked before the bishop and returned every stitch of clothing to his father. He had chosen a new path in life, and there was no going back to his father; even after Francis came to be famous and revered, he and his father were never reconciled. Francis was to find a different kind of family and rely on a different kind of wealth.

Francis's dramatic conversion is often represented as a complete repudiation of everything he had been taught, and as a metamorphosis of his own personality and character. However, Saint Bonaventure (d. 1274), who may have been Francis's most sophisticated biographer, did not understand Francis's conversion in this way. According to Bonaventure, Francis remained as impetuous as always, and other elements of his character were altered rather than rooted out. Bonaventure describes Francis after his conversion as a great merchant because, like the merchant of the gospel, Francis had found the pearl of great price and singlemindedly sold everything to obtain it; and as a man seeking knighthood as a loyal soldier in the army of the great king, Christ. Bonaventure describes Francis's stigmata as the coat of arms of his new lord; in feudal terms, everyone could see, from the stigmata, exactly whose man Francis was.

After breaking with his family, Francis lived for a while as a hermit and continued to help rebuild churches. One of these churches, the Portiuncula (or Saint Mary of the Angels), later became his headquarters when he was in Assisi; this church remained his favorite place, and he insisted that he be allowed to return there to die. It was during a mass at the Portiuncula that Francis had the experience which changed the focus of his religious vocation: he heard the Gospel in which Jesus tells the apostles to take nothing with them on their journey. In cities like Assisi, possessions were taking an ever larger role in shaping people's lives and values; and Francis was struck by Jesus's

call to the apostles to do without them—even to do without necessities. This deeper poverty would become a cornerstone of Francis's way of life.

In Francis's unlikely story, perhaps nothing is more surprising than the fact that he was soon joined by other young men from Assisi and its environs. Within about three years after he broke with his father, Francis had a new family of some dozen "brothers" who shared his work, his prayer, and his poverty; went begging with him; and with him exhorted all they met to repent.

Bishop Guido of Assisi, among others, was supportive of Francis and his brothers; but certain people were suspicious about these young laymen, who seemed to them very like the Cathars of Umbria and Tuscany—enemies of the Roman church. Therefore, probably at the urging of the bishop, Francis and his brothers went to Rome in 1209 or 1210 to seek the support of Pope Innocent III for their way of life. Another surprising part of Francis's story is that he was able to see the pope; even more surprising, or shocking, is that Innocent agreed to allow the brothers to live by a simple rule, consisting largely of scriptural passages, and to preach. But Innocent knew what he was doing. The Cathars and other heretical groups were attractive partly

because, unlike most of the leaders of the Roman church, they tried to live as Jesus and the apostles had lived, Francis and his band were, then, a potential counterforce; Innocent no doubt perceived that Francis combined a zeal for the apostolic life with a passionate loyalty to the church. Innocent must also have been affected by those qualities in Francis that made it difficult to say no to him. For example, Francis was incapable of duplicity; what he said was what he meant, and how he looked reflected what he really was.

Thus the Franciscan order was established and was given the task of preaching penance. In the next decade, the order grew from a small group of Umbrians into an international brotherhood. Just as Francis had attracted followers in and around *Assisi*, he now—personally or by repute—brought thousands to embrace a hard life of preaching, working, and begging. His words and his example spoke to many who found themselves conflicted and unfulfilled in a world where trade and personal wealth were growing alongside desperate poverty. With Francis as their model and guide, the Franciscans became a great new army of the church.

Not long after the meeting with Innocent III, an event as extraordinary as Francis's own conversion took place; as a result, the Franciscan order came to have sisters as well as brothers. A young aristocratic woman of Assisi named Clare left her family and joined Francis and his brothers at the Portiuncula, where Francis tonsured her and welcomed her into the band of poor people for Christ. It is worth noting that Clare was hardly a *tabula rasa* on which Francis wrote. She had an extraordinary mother who traveled as a pilgrim to Jerusalem, and the household in which Clare had been raised was devoted to prayer and apostolic work. Still, Francis gave Clare a focus for her religious concerns and desires. Clare soon went to San Damiano, one of the churches Francis had repaired, where she lived in a cloistered environment with other sisters; and she developed a spirituality and a way of life that constitute one of the grandest statements ever made about the Christian life. However, she always remained devoted to Francis and always turned to him for guidance and support.

When Francis first returned from Rome, he had no clear idea about exactly what he and his brothers would do—whether they would be essentially a contemplative order or would live "in the world." They

decided on an active life supported by both prayer and work; later, if not at this moment, they based their decision on the fact that Jesus had lived in the world. Thus Christ and the apostles were the models for the Franciscan order.

The Franciscan friars were poor not only as individuals but as an institution. In this regard, their order was quite different from traditional monasticism, in which the individual brothers owned nothing but the monastery itself was often quite rich. Francis had originally envisioned the friars as working for their food and other necessities, perhaps as transient laborers or farm workers. They would beg only if they were unable to provide necessities for themselves by manual labor. In no circumstances were they to accept money, because Francis was aware of the problems associated with it. First, money often made people act irrationally; they took a sensuous pleasure in counting coins and running their fingers through coins. Second, some people made the acquisition of money their goal in life. Third, saving money conduced to laziness: if a brother earned enough money for several days' worth of food, he might decide not to work during those days. More philosophically, when Francis stripped himself naked before the bishop, he had decided to forgo all security but God's; and it would be impossible to depend only on God if there was a possibility of accumulating wealth. Ultimately, Francis decided to reject in its entirety the money economy that was then developing in Italy.

Francis and his band covered great distances, working to support themselves and preaching to anyone who would listen (although unfortunately we do not have a single sermon of his). Since Francis and most of the brothers were not trained in theology, they focused on calling people to penance and on trying to reconcile people who were odds with one another. As regards penance, this early ministry was a difficult one, because many of the people to whom it was directed felt that they were already followers of Jesus: they had been baptized; they went to mass; they crossed themselves and prayed. But Francis felt that such people often took Christianity for granted, as a routine, whereas he wanted them to experience Christ and seek forgiveness more intensely. Francis was on fire with the love of Christ and wanted to spread the fire throughout the world. As regards reconciliation, Francis's profound desire may have arisen because he had seen so much

divisiveness—in his family, in his town, in the church, and between secular and ecclesiastical authorities. There is evidence that he helped bring peace in several divided cities, including Arezzo, Siena, Bologna, and Assisi itself. There is a popular story, probably apocryphal, that he worked out a peace agreement between the people of Gubbio and a wolf which had eaten several of their fellow citizens.

The story of the wolf of Gubbio is, of course, only one of many stories about Saint Francis and animals. One of the most famous concerns a sermon he preached to the birds at Bevagna, near Assisi. Francis did indeed love animals; he also loved plants and even rocks, regarding all of creation as his brothers and sisters. He reasoned that God created not just humans but everything that exists, and that therefore all things had a common parent and were all part of the same family, with God as the father. Francis tried to live that belief by treating everything with respect and reverence. He is the author of a great song, *Canticle of the Creatures*, in which he sings the praises of Brother Sun, Sister Moon, and his other siblings, including Sister Death.

It is easy to romanticize Francis's love of creation and think of him as a precursor of modern conservationists and people who hug trees. However, for Francis the love of creatures was always a consequence of the love of God and of a desire to experience God through God's creation. Bonaventure writes that "in beautiful things Francis saw beauty itself," and that for Francis God's works were like footprints one could follow in order to get closer to God. In theological terms, Francis had a sacramental understanding of creation.

In the years after Innocent III approved the "primitive rule," the Franciscan brotherhood underwent tremendous growth. Eventually, the order had to change because it was no longer simply a small band of brothers wandering the roads of Italy, working in the fields, sleeping in barns, and preaching on street corners. Francis himself had no real plans for this new order. He was intuitive rather than analytical, and his charismatic personality was not very well suited for the head of a large group of men, most of whom he did not know. Thus he asked the pope for a cardinal protector to be a guide and a liaison with the hierarchy, and he was fortunate in the appointment of Cardinal Ugolino (later Pope Gregory IX), an astute churchman who was deeply moved by and devoted to Francis.

However, even with Cardinal Ugolino to help him, Francis was not equipped to handle the tasks of the leader of an order. Not only was he frustrated; so were many of the newer friars who did not know him personally and had not experienced his powerful attraction. There were a number of legitimate concerns. For example, could the friars build permanent places to live? Could they have books?—and if so, would they not need money to buy books and places to keep them? As more priests joined the order, where were they to say the mass? How were they to obtain and keep the vestments and vessels necessary for

celebrating the sacraments? What was to happen to friars who had grown too old to live as transients? These were not the sort of questions with which Francis had much patience, and he became perplexed and deeply troubled by the growing complexity of his order. Toward the end of his life, there was already a distance between friars who saw a need for the order to evolve and change and those who regarded any change from the way Francis lived as a betrayal of their founder. Many of these problems were not resolved in Francis's lifetime or, for that matter, for long afterward.

The "primitive rule" that Innocent III approved was little more than a collection of passages from scripture, and we have no copy of it today. By 1221, Francis had composed a longer and more complex rule; but many friars did not approve of it, and it was never made the official rule of the order. Finally, in 1223, Pope Honorius III approved a rule, the *Regula bullata*, that remains to this day the rule for the Friars Minor (the actual name of the Franciscan order). Francis no doubt had help from Cardinal Ugolino in its composition, and Francis was always uncomfortable with some of the compromises it contained.

Early on, Francis had wanted to do missionary work outside the regions where Christianity was dominant; and in 1219 he went to the Holy Land and preached to the sultan, after having seen the army of the fifth crusade and predicted its failure. Apparently Francis impressed the sultan, though without converting him to Christianity. Francis's journey established missionary activities as a part of the work of the order; for several centuries, Francis's followers would be missionaries in Africa, Asia, and the Americas. (The city of Los Angeles, for example, is named for Saint Mary of the Angels—the Portiuncola—because Franciscan friars established a mission of that name there in the eighteenth century.)

As Francis became ill, and increasingly discouraged about the development of an order that already looked very different from the one he had founded, he spent more time in prayer and contemplation. But he never lost his zeal for bringing people to closer to Christ. For instance, for a special Christmas mass at Greccio, he placed a manger with an ox and an ass in the church. Francis wanted people not just to commemorate the birth of Christ but in some real way to experience it. As his first biographer said, "Out of Greccio he made a new Bethlehem."

In 1224, while he was on an extended retreat at La Verna, a mountain in southern Tuscany, Francis had a vision and received the stigmata, the five wounds of Christ. During the last two years of his life, he tried, with some success, to keep these wounds hidden, but news of them spread quickly after his death. People interpreted this "new and unheard-of miracle" in various ways. First, it was taken as evidence that Francis was a mystic, one who experienced union with God in some significant, albeit temporary, way while on earth. Second, God's "seal"—the stigmata—were said to signify that Francis's way of life, and by extension the life of the friars, was authentic and worthy of respect and imitation. Third, the stigmata were said to mean that Francis was more than just another holy man: he was a saint among saints and uniquely Christlike.

A little more than two years after receiving the stigmata, Francis died at the Portiuncula. He was buried in his former parish church, San Giorgio (which was later incorporated into Santa Chiara); and immediately people began to report that miracles of healing were taking place at his tomb. In July 1228, his old friend Cardinal Ugolino, now Pope Gregory IX, came to Assisi for the official proclamation of Francis's sainthood. Gregory also laid the cornerstone for a new burial church; by 1230, this new church was complete enough for the translation of Francis's body to it. From then to the present, millions of pilgrims have come there to venerate Saint Francis.

Francis was the founder of a new order and a man whose personal life became widely known. For many people, his spirituality, although rooted in tradition, nevertheless revolutionized the practice of Christianity. Francis focused on the humanity of Christ, teaching that to know Christ one must be with him both at the incarnation in Bethlehem (Greccio) and at the atonement on Calvary (La Verna). Whereas much of Christian practice in Francis's day had its origins in monasteries and the feudal aristocracy, Francis and his followers were active in cities, seeking to explain and practice the great truths of the faith in ways that would make sense to urban people. Francis, who started by rebuilding churches around Assisi, ultimately rebuilt the Roman Catholic church itself.

Francis wrote several works, the most famous being *Canticle of the Creatures* (or *Canticle of Brother Sun*). The most recent edition in

English of Francis's writings is *Francis of Assisi: The Saint* (1999), the first volume of *Francis of Assisi: Early Documents*; as of 2002, two more volumes were projected, to include virtually all the thirteenth-century sources for the life of Francis. Until this work is completed, readers will still need to consult *Saint Francis of Assisi: Writings* (1973).

Franciscan Order

The Order of Friars Minor, commonly called the Franciscans after its founder, Saint Francis of Assisi, had its beginnings in the thirteenth century. In 1209 or 1210, a dozen young men from Assisi, who had been living together in poverty as penitents and working for their daily needs, sought and gained approval of their order from Pope Innocent III. The community had begun when several local men left their families and their material goods to follow Francis. Francis had put together a rule that consisted primarily of biblical quotations, and this

was the rule— called the "primitive rule"—that Innocent III approved orally.

As the order grew during the next decade or so, there were problems that Francis had not anticipated and was not prepared for. By 1217, it was necessary for the friars to come together for a general chapter. The "primitive rule" had been sufficient when there were only a few friars, but it did not work well when the order had grown to include thousands of men from many different parts of Europe. For example, Francis had allowed anyone to join his brotherhood merely by coming along with the brothers as they traveled around; and many of those who joined him in this way must have not lasted long. By contrast, the established orders of the church required a novitiate—a time of testing—after which a brother would take vows for life.

In 1219, Francis went to the Holy Land, and while he was away the crisis in his order intensified. When he returned to Italy, he wrote a long rule that was never officially approved, in part because many brothers were not prepared to live under it. With some help from the cardinal protector of the order, Ugolino (the future Pope Gregory IX), Francis prepared a rule which was formally approved in 1223 by Pope Honorius III; it is known as *Regula bullata*. Although this rule was a somewhat watered-down version of Francis's original vision for his order, it was strict about the basic principle of poverty, both individual and corporate.

The changes in the brotherhood, in some ways reflected in *Regula bullata*, made Francis uncomfortable with what he had created. As he neared death, he dictated a testament that he thought would be a guide for the friars, along with *Regula bullata*. However, four years after Francis's death Pope Gregory IX issued a bull stating clearly that only the *Regula bullata* was binding on the friars.

For the friars, the century after Francis's death was a time of turbulence. One issue was whether the order should be made up primarily of laymen—Francis himself had not been a priest— or whether it should seek out priests to become members and should prepare brothers for the priesthood. The outcome was that the Friars Minor became "clericalized," so that they were enabled not just to preach penance but also to hear confessions and grant absolution. Brother Elias, a friend of Francis and a controversial minister general,

was the last layman to head the order. Priests need a certain degree of stability and a certain amount of property in order to perform their duties; thus, inevitably, as a larger percentage of friars came to be priests, the character of the order was stabilized. This was a far cry from Francis's wandering band. By the mid-thirteenth century, Franciscan friars were being chosen as bishops, first in the mission field and later throughout western Europe. In 1288, Brother Jerome of Ascoli, a former minister general, was elected pope, taking the name Nicholas IV.

A second issue was education. The Dominican order had been founded at about the same time as the Friars Minor, and from the outset the Dominicans were dedicated to learning so that they could preach correct doctrine to heretics. Soon, the Franciscans were also recruiting at universities and were sending their best and brightest for a university education, especially to the University of Paris, the greatest center for the study of theology. The friars' entry into the universities led to two problems. First, it created tension between the secular clergy, who had traditionally controlled the universities, and the friars, who seemed to be upstarts trying to take over these institutions. Second, within the Friars Minor there were many who objected to this emphasis on book learning; they argued that Francis had not been a scholar. Around 1300, the Franciscan poet Jacopone da Todi wrote that "Paris has destroyed Assisi."

A third issue was poverty. Francis's insistence on collective as well as individual poverty became a burning question among the friars and between the order and the secular clergy. Within a few years of Francis's death, Pope Gregory IX, in the bull *Quo elongati*, had agreed to certain legal fictions by which the friars could have property (e.g., churches, books, and liturgical vessels) de facto without actually owning it. Over time, these fictions led to so much relaxation of Francis's ideas about poverty that no one could tell by looking that the friars were propertyless. Because of Francis's uncompromising views on poverty (in one early literary work about Francis, he marries Lady Poverty) and the changes that took place in the order after his death, this issue would be the primary focus of controversy within the order and in its relationship with the larger church for the rest of the thirteenth century and far beyond.

These three issues—clericalization, education, and poverty— had a

common foundation. Did being a Franciscan mean doing literally what Francis did? Or was it an evolving concept, responding to changes in the order and changes in the order's role within the church? Some friars—particularly some of Francis's colleagues who outlived him by many years—saw any change from the order's earliest days as a betrayal of Francis. But many others applauded change because it allowed them to participate in the "rebuilding" of the church in ways Francis had not considered.

In the 1250s, there were struggles between friars and the secular clergy at the University of Paris over certain academic privileges. In the "pamphlet war," accusations were made that the friars were heretics. Specifically, their understanding of Christ's poverty was challenged. More important, however, were claims that the friars had identified their place in the history of the church with certain prophecies of Joachim of Fiore (d. 1202), whose schemes of history and apocalyptic imagination were of doubtful orthodoxy in the eyes of many.

With all these issues unresolved, the scholar and mystic Bonaventure became the minister general (1257–1274). His efforts to deal with them earned him the title of second founder of the order. Before heading the order, Bonaventure had been involved in its struggle to maintain and expand its privileges at the University of Paris. Shortly after becoming minister general, he issued revised statutes of the order called the Constitutions of Narbonne. This step was vital because some conflicts within the order were in part due to a confusing collection of statutes that had been approved by various general chapters. Bonaventure also undertook the task of writing a new and authoritative *vita* (life) of Saint Francis; in 1263, he published his *Legenda maior* (or *The Life of Saint Francis*). Bonaventure himself certainly took a progressive view of the order and its mission, but he also understood the friars who rejected some of the changes he favored. Despite considerable tension, the order held together as long as Bonaventure was in charge.

Following Bonaventure's resignation as minister general shortly before his death in 1274, the Friars Minor had a less activist, less involved leadership. Furthermore, during the last part of the century the friars received uneven support from the popes; and the last people who had known Francis personally were dead before 1290. Not surprisingly, the final years of the century were tumultuous for the

brotherhood.

In 1279, Pope Nicholas III, in the bull *Exiit qui seminat*, defined the friars' poverty as consisting of "use without right"— i.e., the friars could use goods as long as someone else actually had the legal possession of those goods. Nicholas declared that the pope himself was in legal possession of all goods that the friars used.

By this time, there were groups of friars in the Marches of Ancona, Tuscany, and Provence who were prepared to fight for their right to be poor, whether this meant opposing the government of the order or the papal privileges that the friars had received. These men became known as the Spirituals, in contrast to the main body of friars, the Conventuals. (These terms refer to certain attitudes toward the order, not to clearly defined organizations.) The Spirituals included several men of great ability, such as Peter John Olivi, whose writings were often at the center of the ensuing controversy over poverty. Tension mounted, and when the hermit Pietro da Morrone was elected pope in 1294, taking the name Celestine V, the Spirituals recognized that they had a sympathetic ear in Rome. Celestine divided the Franciscan order, creating the Poor Hermits of Pope Celestine for the Spirituals and leaving the Conventuals as the order of Friars Minor.

When Pope Boniface VIII succeeded Celestine V less than a year later, he abolished the Poor Hermits of Pope Celestine; some of its members returned to the order of Friars Minor while others fled to Greece. However, the struggle to define the friars' way of life and the idea of poverty was far from over. After several conflicting acts by the successors of Boniface VIII, there was a confrontation during the pontificate of John XXII (1316— 1334). In 1318, the Inquisition burned four dissident friars at Marseille. In 1322, John issued a bull claiming that it was legal for one pope to alter his predecessors' decrees; thus, he was not bound by Nicholas III's *Exiit qui seminat* of 1279, which the Spirituals had been using in their cause. A year later, in *Cum inter nonnullos*, John stated that it was heretical to believe that Christ and the apostles had no right of possession and use of things. Within a few years, the minister general Michael of Cessna, who favored the Spirituals, was in a papal prison, and soon afterward he escaped and fled to the court of the Holy Roman Emperor Lewis of Bavaria. Although a Spiritual group known as the Fraticelli survived into the

fifteenth century, the history of the Friars Minor after 1328 is the history of the Conventuals.

For the great majority of Franciscans in the fourteenth century, life was quite different from that of the order's founders. Most were priests with a fair amount of education in scripture and theology. Many lived rather comfortably in quarters attached to their friaries. They ate better than many of those to whom they ministered and were dressed in simple but hardly tattered habits. By the end of the thirteenth century, some people were already remarking that the friars—unlike Francis—lived in comfort and stability. For example, Dante has a friar in hell comment that the Franciscan cord once was worn by men leaner than its present wearers (*Inferno* 27.93). During the fourteenth century—a period of tragic and confusing events such as the Babylonian captivity of the Papacy in Avignon, the Great Schism, and the black death—Franciscan friars sometimes came under scathing attacks for their timid and even corrupt way of life.

Some of the friars' critics were themselves Franciscans. In addition to the Fraticelli, who had continued to exist after their condemnation by John XXII, there were always some friars who tried more zealously than the established friaries to imitate Francis's life. Paoluccio de' Trinci established a small isolated friary in the Umbrian hills and obtained permission for himself and his brothers to adhere as closely as possible to the way Francis had lived. By the end of the fourteenth century, there were several friaries committed to what became known as "the Observance," although their relationship with the governing structures of the Franciscans was often strained.

At the beginning of the fifteenth century, several extraordinary men who had either entered or transferred to Observant friaries became the leaders of reform within the order. The men who are considered the pillars of the Observant movement—Bernardino of Siena, John of Capistrano, James of the March, and Andrea of Sarteano—established it as the dynamic force of the Franciscans. Bernardino, an extraordinarily skilled preacher, was probably the most famous friar of his time; he, John, and James were eventually canonized.

During the second half of the fifteenth century, there were numerous attempts by friars of both groups, and by several popes, to find a way for the Observants and the Conventuals to function as one order.

However, despite meetings, detailed proposals for constitutional arrangements, and papal bulls, it proved impossible to find a *modus vivendi* between the two factions. In 1517, Pope Leo X granted the Observants the name Friars Minor, thus ultimately dividing the order into two completely different institutions.

Missionary work was always a part of the activity of the friars. The early Franciscans, including Francis himself, sought to bring Christianity to lands outside of Christendom. Francis journeyed to the Holy Land and preached to the sultan; and five friars were martyred in Morocco before Francis's death. By 1300, there was a friary in Beijing, and a few years later friars were martyred in India. Christopher Columbus was closely connected to the Franciscans, who were therefore the first priests to reach the new world; and the first bishop in the new world was a friar.

Franco-Italian: Language

As one of the early theorists, Dante Alighieri occupies an important place in the history of medieval concepts of the origin and evolution of human language. Polyglossia, linguistic mutation, and instability are central phenomena of postlapsarian language systems, whose endless diversity made human communication difficult except among the most closely bound communities, Dante sees both synchronic and diachronic diversity, initially in the three major world languages and subsequently in the three Latin-derived idioms he examines in *De vulgari eloquentia*. He identifies each by its word of affirmation: *si* in Italian, *oc* in Provençal, and *oil* in Northern French.

In the late *Duecento*, Dante saw each of these language systems as

related to the others but at the same time unique in specific traits: Italian and Provençal excelled in lyrical qualities and were ideal for the new secular love poetry; French excelled in its facility and beauty in rendering the prose tales of the Trojans, the Romans, and King Arthur; Italian claimed, as well, the particular privilege of closest proximity to Latin, the universal language of grammar. Other authors praised the beauty of the *langue d'oïl*: an anonymous Veronese claimed of French that *qi en premier l'aprent/ja n'i pora mais autrement/parler ne autre langue apprendre*—"He who first learns it will nevermore be able to speak otherwise, or to learn another language."

Debate continues as to the authorial intentionality of Franco-Italian polyglossia: i.e., whether such writers were able to apply "correct" French usage (still of course far from standardized) but consciously chose a dual-tiered idiom, or whether the Italian elements of morphology, syntax, and vocabulary were a result of simple incompetence. The unfortunate charge of "pathological hybridism," made by nineteenth-century and some twentieth-century scholars—the lack of any linguistic systemization—has been revealed as misguided in more recent studies. No reasonable claim of incompetence can be made in the case of Brunetto Latini, a master rhetorician and man of letters, who wrote his *Livres dou tresor* while he was in France, in French that he considered as proper as the still fluid dialects he encountered there; he wrote a much different and vastly abbreviated version, *Il tesoretto*, in Italian verse. Nor should we underestimate the linguistic abilities of the anonymous Paduan author of *L'entrée d'Espagne*, whose clerical erudition in Latin and French is constantly in evidence. While equal linguistic expertise may not be evident in some of the more than 100 Franco-Italian texts, authors with sufficient knowledge of both parent languages may have wished to combine the lyrical qualities of Italian with the relatively easy, pleasurable French. Given the quantity and variety of authors and texts, many of which remain unknown and unedited, one should avoid global judgments.

The term Franco-Italian fails to situate the idiom geographically. Problems of this kind remain unresolved; since the degree and level of intra- and intertextual standardization are difficult to assess, terms such as Franco-Venetian and Franco-Lombard are often used with reference to works where we can specify the major northern Italian dialect used.

Scribal idiosyncrasies present further difficulties. The French infrastructural plane, which is often linguistically datable to the twelfth and thirteenth centuries, especially in the *chansons de geste*, is generally older than, and even archaic in relation to, the Italian suprastructure; the French is entered as a written language known to the *trovatore* or poet through inscribed texts, while the Italian is superimposed in the form of the spoken language of the individual's period, mid-*Duecento* to latter *Trecento*. In any case, Franco-Italian, surviving only for a short time before yielding to stronger peninsular Italian dialects, was conceived as a literary language initially used in the "importation" of French works. It is unlikely that Franco-Italian was ever used as a spoken language. There is thus a series of constant dialogic interactions for the philologist and linguist to contend with, although the reader with primarily literary interests able to comprehend Old French and *Trecento* Italian will have little difficulty with these texts.

Franco-Italian: Literature

Within the Veneto-Lombard region of the mid-*Duecento* to the latter *Trecento*, the literary phenomenon variously known as Franco-Venetian, Franco-Lombard, or, more broadly, Franco-Italian appeared in a corpus of more than 100 texts. These texts—the majority of which are *chansons de geste*, romances, romance epics, religious writing, and chronicles—testify to widespread Francophilia among the aristocracy and the thriving middle classes. The Franco-Italian corpus flourished within fairly specific geographical, chronological, literary, and linguistic boundaries before vanishing entirely, eclipsed by the forces of what we know today as Italian literature.

Authors as diverse as Brunetto Latini (*Li livres dou tresor*) and Rustichello da Pisa (rendering Marco Polo's travels into *Li divisament dou monde*) are commonly identified as Franco-Italian, although Brunetto, like many others using this rather loosely defined idiom, states that he is writing correct, "pure" French. It is probable that Brunetto, like others who were competent in both languages, was considering the maximum diffusion of his work as well as the aesthetic qualities of French, *plus delitable et plus commune a toutes gens*: "more pleasant and more widely known to all people."

The largest extant collection—some twenty-five manuscripts—is now in Venice, in the Marciana Library, to which it was bequeathed in the late eighteenth century. Much has been lost; sixty-seven manuscripts *in lingua francigena* are included in 1407 in the library holdings of

Francesco Gonzaga, duke of Mantua, who is considered one of the primary patrons of authors using the Franco-Italian idiom, along with other great regional potentates of the day such as the Estensi, Scaglieri, and Visconti.

Two of the extant versions (V4 and V7) of *La Chanson de Roland*, essential to a comprehension of the global text, are written in Franco-Italian. Other *chansons de geste* include *La bataille d'Aliscans*, *Aspremont*, and *Aquilon de Baviere*, plus the *Geste francor*, a long compilation of epic tales that include the so-called *enfances* (birth and youth tales) of Roland and Charlemagne, in addition to *Gui de Nanteuil*, *Bues d'Aigremont*, *Foulque de Candie*, and *Doon de Mayence*. Romances, largely those related to antiquity and Arthurian legends, include *Le roman de Troie*, *Florimont*, *Les prophesies de Merlin*, and *La folie Lancelot*. To the Venetian Martin da Canal we owe chronicles of La Serenissima, and to Nicholas of Verona three identifiable works: *La passion*, *Pharsale*, and *La prise de Pampelune*.

La prise de Pampelune belongs to a group of romance epics thematically centered on the Carolingian expedition to Spain, which forms the first part of the French *Chanson de Roland*. Of this group, the work most widely known is *L'entree d'Espagne*, in 15,805 assonanced verses, an "introduction" to the ill-fated mission which will end seven years later at Roncevaux. Written by a highly talented, erudite Paduan with impressive knowledge of classical and medieval literature, *L'entree* has received more scholarly attention than most of these generally neglected works.

Within the Rolandian corpus, *L'entrée* provides the motivations for the Spanish expedition, differing partially from those found in the *Chanson*. Charlemagne is virtually shamed into the enterprise after a dream-vision of Saint James of Compostella, who reminds him of an earlier, still unkept promise to recuperate the pilgrim route from the Muslim infidel. However, with only two Spanish cities taken and the expedition stalemated at Pam-pelune for the greater part of the extant *Entrée*, the text's literary interest lies less in narration of traditionally epic material than in the iconoclastic development of the relationship between Charles and Roland, which engenders genre modifications to romance and, finally, raises the narrative to a quasi-hagiographical plane. Increasingly serious quarrels between the two protagonists

eventually erupt into violence, resulting in Roland's abandonment of the expedition at Pampelune. The most innovative portion of the text narrates the youth's questlike journey to the Muslim east, where he reestablishes his heroic stature under the benevolent seignury of the sultan of Persia. In what is probably a lacuna of 5,000 to 6,000 verses, Roland then reconquers Jerusalem for Christendom and finally returns to Spain, where an encounter with the hermit Samson elevates him to the realm of the chosen *miles Christi* (soldier of Christ).

The sequel, *La prise de Pampelune* (*The Taking of Pamplona*), continues the battle for the pilgrim route to Compostella, introducing the Lombard king Desiderio as an important character and adding considerable romance material. *La Spagna*, a work of the later *Trecento* in the Tuscan dialect, forms a vast summary of the entire Rolandian saga, including the hero's death at Roncevaux and the execution of the traitor Ganelon. These texts and *Li fatti di Spagna*, also in Italian, would inspire Boiardo and Alios to.

The Franco-Italian corpus was produced at a particular moment in Italian literature when external influences on the nascent language and letters were revitalizing the French epic and romance traditions for the masterly adaptations of the Italian Renaissance. Evolving within the rich intellectual and cultural climate of the nascent universities of Padua amid the great courts, communes, and *signorie* of the region, the finest works of the corpus offer evidence of the brilliant prehumanist movement in its initial explorations of Greco-Roman antiquity and new ways of thinking about humanity and the world.

Frangipani Family

The Frangipani, a Roman family, go back to the tenth century. The family became significant among leading Romans in 1060 with Cencius I, who was one of the most determined partisans of Archbishop Hildebrand, later Pope Gregory VII (r. 1073-1085). Hildebrand sought to reform the church and liberate it from imperial influence, and he opposed simony and the marriage of clergy. With the help of the Frangipani, Hildebrand's candidate for pope, Bishop Anselm of Lucca, was enthroned in Rome as Alexander II (r. 1063-1073). Cencius and his son Giovanni, who are both documented as *Romanorum consules* (Roman consuls), loyally defended the cause of the reform papacy against resistance from the old Roman nobility and King Henry IV of Germany. By c. 1100 the Frangipani and the Pierleoni had become the most powerful Roman families. Their fortresses at the Circus Maximus,

the Roman forum, and the Colosseum controlled access to the Lateran, the seat of the popes.

The sons of Giovanni Frangipani influenced the papal elections of 1118, 1124, and 1130 by applying force and bribery, and they no longer hesitated to associate themselves with the party of the emperor. Like the Pierleoni, the Frangipani sought to bring their own candidates to the papal throne. Shifting party allegiances were commonplace. Oddone II, a member of the Frangipani family, submitted in 1186—as chief magistrate of Terracina—to the authority of Henry VI. During the papacy of Innocent III (r. 1198-1216) Oddone's family, with its many branches, was pushed into the background by the pope's nephews from the Conti and Annibaldi families.

The reliance of the Frangipani on Frederick II led, in 1236, to the destruction of their city fortresses in Rome. Further losses in Latium followed. Nevertheless, during the next centuries the Frangipani were able to maintain a considerable place in the Roman elite, although they no longer had their former significance.

Frankish Kingdom

In 773, Charles, king of the Franks, led his armies across the Alps and laid siege to Pavia, capital of the Lombard kingdom. Pope Hadrian had requested Frankish aid against the Lombard king, Desiderius, who had seized Ravenna and was threatening territories claimed by the pope in central Italy and around Rome itself. The pope's request and the subsequent papal invasion followed a pattern set by earlier papal petitions to Charles's father, Pepin. Pepin's seizure of the Frankish throne had been sanctioned by Pope Zacharias; and Pepin and his sons, Charles and Carloman, had been anointed by Pope Stephen II in 754. When Stephen appealed for the Franks' support against the Lombard king Aistulf, Pepin took his army into Italy twice, in 755 and 756, and forced Aistulf to return captured cities to papal control. The new king of the Franks also issued the so-called Donation of Pepin, which ceded most of central Italy from Rome through the Byzantine exarchate of Ravenna to the papacy. In practice, this represented a papal declaration of independence from the emperors in Byzantium.

Desiderius (r. 756-774) had tried to appease his Roman enemies and befriend the Franks. His daughter was briefly married to Charles in the early 770s. But the attacks by the Lombards in Umbria and the Pentapolis prompted Hadrian's request and Charles's invasion. The siege of Pavia lasted nearly nine months, until June 774, when Desiderius surrendered. Charles declared himself king of the Lombards and sent Desiderius and his family into exile. The more sophisticated Lombard state had been no match for the Franks' superior military power.

During the siege of Pavia, Charles made his first visit to Rome, where he celebrated Easter (774) and confirmed his father's donation. After conquering the Lombard kingdom, however, Charles was not so eager to turn over actual control of large parts of Italy to the pope. Indeed, Charles was quick to take over the administrative machinery of the Lombard state, and to confirm the privileges and properties that had been granted by previous Lombard kings and dukes to churches, to monasteries, and even to laymen. Most of the Lombard dukes and the aristocracy soon swore allegiance to their new Frankish king. They included the duke of Spoleto, Hildebrand, who had been installed in 773-774 with the backing of the papacy. When Duke Rodgaud of Friuli rebelled against Frankish rule in 774, Charles struck rapidly. Rodgaud

was killed, and any thoughts of Lombard revolt disappeared. Over the next years and decades, Charles gradually replaced Lombard dukes and counts with Franks and others from north of the Alps. For example, when Hildebrand died c. 789, the Frankish *missus* Winigis became duke of Spoleto, and in this role served Charles and later Louis the Pious as the principal protector of the popes and Rome. But many Lombard landholders retained their properties, if not their public offices. Leading Lombard families, especially in the cities, continued to control ecclesiastical offices. The control of the local Lombard aristocracy over the bishopric of Lucca is a good example.

In 780-781, Charles came to Italy again, spending Christmas at Pavia and Easter at Rome. In Rome, Pope Hadrian anointed Charles's young sons, Pepin and Charles, as kings of Italy and Aquitaine, respectively. While he was in Rome, the elder Charles concluded an agreement with the pope about the extent of the territories that would be ceded to the papacy, especially those in Sabina, Campania, and Roman Tuscany, and would form the basis of the papal state—that is, the republic of Saint Peter. Later, in 781, Charles issued a capitulary from Mantua that imposed some aspects of Frankish law and government on his Italian kingdom, Charles was now in control of northern and central Italy and exercised *de facto* authority even in those territories granted to the papacy, except in the duchy of Rome itself. South of Rome, however, the Lombard duchy of Benevento continued to be outside the rule of the kingdom of Italy. Beyond Benevento, Byzantium controlled the duchy of Naples, most of Apulia and Calabria, and Sicily.

In 787, Charles led his army into Italy and advanced as far as Capua in order to bring Benevento within the Frankish fold. Duke Arichis II, the son-in-law of the last Lombard king, Desiderius, was compelled to submit to Charles and give up his son Grimoald as a hostage. Later in 787, when Arichis died, Charles returned Grimoald to Benevento as duke, despite the protests of Pope Hadrian. Grimoald promised to pay tribute and to mint coins in Charles's name and to follow the reforms of silver coinage instituted in the rest of Italy by the Carolingians. In 788, Grimoald, along with Duke Hildebrand of Spoleto, defeated Byzantine forces in Calabria. But within several years Grimoald had asserted his independence from Carolingian authority and had begun minting coins in his own name. Subsequent Carolingian expeditions against

Benevento in 791-792, 800, and 801 — the latter two were led by King Pepin—did little to compel the Beneventans' submission. Indeed, Duke Winigis of Spoleto was captured by Grimoald in 802 and was held for eighteen months. Finally, in 812, Grimoald agreed to pay Charles an annual tribute of 25,000 gold *solidi*; still, Benevento remained largely beyond the influence and control of the Carolingian kings of Italy, Benevento was probably too far from Aachen, or even from Pavia, for effective rule. Moreover, a sense of the Lombards as separate from, and superiority to, the Franks continued to be cultivated in the Beneventan territories.

In 799, Pope Leo III was attacked by his enemies in Rome. Rescued by Duke Winigis, he was brought to Paderborn, where he met with Charles and Charles's advisers. Charles accepted his responsibilities as the protector of Saint Peter and patrician of the Romans, and sent Leo back to Rome with an armed escort. It was probably at Paderborn that plans were discussed to make Charles an emperor. But not until the autumn of 800 did Charles proceed to Rome to bring order to the affairs of the church. There he presided over an assembly at which Leo took an oath denying all the accusations of his attackers, who were subsequently punished by Charles. Then on Christmas Day 800, as Charles was rising from prayer before the tomb of Saint Peter, Pope Leo placed a crown on his head and hailed him as emperor. However reluctant Charles—now Charlemagne—may have been, this was a carefully planned event that suited the needs of both the Franks and the papacy. Charlemagne may have expected to crown himself and may have regretted the difficulties the imperial title caused him with the Byzantines, but he accepted the responsibilities that the title implied. Moreover, he had brought with him many gifts to be presented to the churches in Rome following his coronation.

Charlemagne spent the whole winter and much of the spring in Rome overseeing Rome and Italian affairs, political and judicial. He never returned to Italy following his coronation as emperor, although Pope Leo III visited him in Reims in 804. Pepin continued to act as king of Italy, usually with the help of Frankish advisers such as his cousin Adalard of Corbie, a sometime monk at Monte Cassino. Charlemagne negotiated with the Byzantines for their recognition of his imperial title until 812. They conceded that he was an emperor in return for his

giving up claims to Venice and parts of Dalmatia.

In the first years of the ninth century a new menace to Italian security appeared: Saracen raiders from North Africa and Spain, Pepin sent a Frankish fleet against the Saracens who were raiding Corsica for plunder and captives in 805-806. He had some success against these raiders in 807, but despite this the Saracens attacked Corsica and Sardinia again and again. In 813, they attacked Civitavecchia on the mainland, having raided Ischia in the Bay of Naples a year earlier. Raids on the Italian mainland abated for nearly twenty years, though attacks on the islands and on merchant shipping continued. Not until 828 did Count Boniface II of Lucca, whose Bavarian father had been appointed count c. 812, conduct a successful sea raid against the Saracens, even attacking them on the North African coast. Meanwhile, the Aghlabid Arabs from North Africa had begun their conquest of Byzantine Sicily, from whose secure ports they increasingly launched ships to raid both coasts of Italy.

After Pepin died in 810 his son Bernard became king of Italy (812-817), with Wala, Adalard's brother, as a mentor. When Bernard's uncle Louis the Pious succeeded Charlemagne as emperor and king of the Franks, Bernard, fearing that Louis would cut him and his children out of the succession, revolted. Louis quickly crushed the rebellion. He had Bernard and others blinded, an injury from which Bernard subsequently died. Louis's son Lothair (Lothar, r. 817–855) became the king of Italy. Many of the Franks in Italy who had supported Bernard were pardoned by Louis in 821, and the possessions that they had forfeited were returned to them.

In 817, Louis the Pious also granted to the papacy a new privilege—the so-called *Ludovicianum*—which confirmed the "donations" of Pepin and Charlemagne and clarified the extent of papal territory and the virtual autonomy of the papacy. The pope was still to receive protection from the Franks, but the emperor agreed not to intervene in Roman affairs unless asked. Vicious factional fighting in Rome in the early 820s, in which two of the newly crowned coemperor Lothair's men were killed, led to a rethinking of the agreements between the Franks and the papacy. The *Constitutio Romana* of 824 sharply diminished papal autonomy. The popes were required to swear an oath of allegiance to the emperor after their election but before their

consecration, and the Roman people were required for the first time to swear loyalty to the Frankish emperor. The patrimony of Saint Peter became virtually a Frankish protectorate. Moreover, an imperial and a papal *missus* were to hold court in Rome together to hear any complaints pertaining to the actions of the papal officials. Since the days of Pope Hadrian, the papacy—backed by the donations of Pepin and Charlemagne and the general protection of the duke of Spoleto, Winigis—had been appropriating lands in the Sabina. In 829, the abbey of Farfa brought a complaint against such seizures of their properties before a court in the Lateran palace, and the imperial *missus* ordered the pope to restore the illegally seized lands to Farfa. Shortly thereafter Lothair confirmed Farfa's possession.

Lothair spent much of his time in Italy from 831 to 841, especially after his break with his father, Louis, in 834. He brought a large number of his followers with him into Italy and had to find ways to support them. He forced bishops and abbots to lease estates to his followers and sometimes simply seized church properties. He also rewarded his Franks with secular and ecclesiastical offices. Lothair also legislated for his Italian kingdom. Capitularies issued in 832, for example, were concerned with the oppression of small landlords and the poor, the maintenance of proper mints and good coins, sworn conspiracies, and the upkeep of roads and bridges, among other topics. It is difficult to determine how these capitularies were actually implemented. Real power and jurisdiction in Italy were increasingly held by various regional dukes and counts as well as by the bishops of certain major cities such as Milan. Lothair and later his son Louis II used *missi* such as a certain Leo, who became count of Milan (823-844), to check the growing power of the major counts and the largest landholders.

In 844, ongoing factional strife in Rome prompted Lothair to send his young son Louis to deal with the situation, and to prevent any papal consecrations without imperial consent. Louis's troops plundered some of the estates of the Roman aristocracy in papal territory. But the pope anointed Louis as king of Italy—Louis II—and invested him with a sword. Louis's presence in Italy was hardly sufficient to stop the now nearly annual Saracen raids on both Italian coasts. Benevento itself was under almost continuous attack. Bari had fallen to the Saracens in 843 and was to remain under their control until 871. The third emir of Bari,

Sawdan, became an important figure in political developments in southern Italy. To complicate matters several rulers in the Italian south hired Saracen mercenaries to fight in their conflicts with rival cities and principalities. In 846, a large force of Saracens struck at the heart of Carolingian Italy, and indeed of all Christendom. Sailing past the poorly defended port at Ostia and up the Tiber, the Saracens plundered Saint Peter's basilica in Rome as well as other churches that lay outside the ancient Aurelian walls. Frankish forces pursued the treasure-laden Saracens but were beaten back near Gaeta. Louis II limped back to Rome. Lothair sent more troops to his son in Italy as well as funds to help Pope Leo IV build a defensive wall around Saint Peter's and the Vatican. When the Saracens returned in 849, the half-built Leonine wall was not tested, since they were defeated off Ostia by a Neapolitan fleet recruited by the pope. In the next year, 850, Louis II was crowned emperor by Leo IV.

Louis II was the first Carolingian king to spend most of his reign resident in Italy. The Franks had inherited a fairly sophisticated royal administrative machinery centered in Pavia. This system of royal officials operating along with the public jurisdiction of the dukes, counts, and gastalds had worked well for several generations of Carolingian rule in Italy. When Louis tried to strengthen royal institutions, however, he ran directly against the prevailing and growing powers of the great landowners, most of whom he and his Carolingian predecessors had invested with their lands and public offices. Louis issued capitularies condemning the abuses of the counts and others—their violence, their arbitrary exercise of justice, and their exploitation and oppression of the weak and poor. It is not evident that the king's orders had much effect. Louis was himself enmeshed in the network of aristocratic families, patronage, and clientele. The personal politics of land, kinship, and lordship was beginning to overwhelm public authority in Italy as it had done elsewhere in post-Roman Europe.

Louis's wife, Angilberga, was a member of the powerful Supponid family. Her father, Suppo I of Brescia, had helped to quell the rebellion by Bernard in 817 and had been rewarded with the duchy of Spoleto in 822. But the base of Supponid power stretched across Emilia and Lombardy from Brescia and Parma to Turin. Angilberga's niece, Bertilla, married Berengar, who was to become the non-Carolingian

king of Italy (888-924) even though he was a grandson of Louis the Pious through his mother, Gisela. Angilberga played an important role in her husband's rule over the kingdom of Italy. She shared power with Louis, going on diplomatic missions (sometimes on her own), presiding over assemblies and courts in Louis's absence, and intervening in disputes. She had close relations with the papacy, especially with Pope John VIII. Documents often refer to her as *consors regni*. Many of Louis II's donations of land went to Angilberga or to persons or institutions that she sponsored. She founded the nunnery of Saint Sixtus in Piacenza and was a particular patroness of San Salvatore (later Santa Giulia) in Brescia. San Salvatore, founded by Desiderius and his wife Ansa, was the nunnery of royal and imperial women; it received privileges from Charlemagne and Louis I, whose second wife Judith held it in benefice. Louis II's sister, Gisela, was its abbess after 861; later, King Berengar's daughter, Berta, was abbess. The ongoing patronage of San Salvatore by successive Carolingian kings and their wives, sisters, and daughters is one of the remarkable continuities from the Lombards carried through the Frankish ninth century and beyond.

Despite the efforts of Louis II and Angilberga to provide responsible government and build public works, the threat of Saracen attacks always loomed. Louis II led expeditions south of Rome against the Saracens in 852 and 860, but with little effect. The Saracens had in fact briefly captured Benevento itself in 851 and had attacked Naples in 856. From their base in Bari they plundered the lands of the great monasteries at Monte Cassino and San Vincenzo al Volturno almost at will. In 866, Louis assembled the largest Italian army of the ninth century and moved south to retake Bari. The effort took him five years, and when Bari did fall in 871, it was largely with the aid of Croatian and Byzantine fleets. Five years later Byzantium took over control of Bari directly. During their long stay in the south, Louis and Angilberga had managed to alienate most of the Lombard leaders there, especially in Benevento. In the summer of 871, Louis and Angilberga, their great army having melted away after the capture of Bari, were briefly imprisoned by Adelchis of Benevento. Contemporary sources blame the captive emir of Bari, Sawdan, for stirring up suspicions concerning Louis's intentions regarding the Lombard principalities in southern Italy. Louis and his empress were released after a month of house arrest,

but only after swearing an oath never to return to Benevento. The Franks' hopes of controlling the Lombard south were finished. Louis, humiliated by the experience in Benevento, had himself recrowned as emperor in 872 in Rome by Pope Hadrian II, who absolved him of his Beneventan oath. After several abortive trips as far south as Capua, Louis II died in Brescia in 875, without a male heir. He was buried at Sant'Ambrogio in Milan. He was the last Carolingian in the direct line of succession who actually tried to rule the kingdom of Italy in person.

Louis's uncle, Charles the Bald, with the support of most of the leading men in Italy, was crowned emperor in 875. He appointed his brother-in-law, Boso of Provence, as his representative in Italy, and later Boso married Louis and Angilberga's daughter Ermengard. Charles died in 877 and was succeeded by his nephews Carloman (877-880) and Charles the Fat (880—887). During his brief stays in Italy, Charles had managed, at one time or another, to offend most of the leading men in Italy, and particularly Guy of Spoleto. Citizens in Pavia even clashed with royal troops. Elsewhere Saracen depredations continued completely unhindered by any resistance from the royal house. San Vincenzo ai Volturno was plundered and destroyed by fire in 881. Saracens sacked Monte Cassino in 885, and the monks fled to Capua. Later in the 890s, the monastery of Farfa was abandoned after several Saracen attacks.

Berengar of Friuli became king of Italy in 888 and was immediately opposed by Guy of Spoleto and Guy's supporters in northern and northwestern Italy. Guy defeated Berengar in battle and in 891 was crowned emperor. His son, Lambert, was crowned coemperor in 892. After Guy's death in 894, Lambert and Berengar agreed to share the kingdom, partly to fend off the advances of Arnulf, a great-grandson of Louis the Pious, who invaded Italy in 894 and again in 895-896. Arnulf's forces entered Rome in 896, Arnulf had himself crowned emperor, but shortly afterward he died of a stroke. Guy and Lambert were the last kings of Italy to issue capitularies, and their themes were the familiar ones—protection of small landholders against oppression by the great and powerful. When Lambert died in 898, Berengar was left as the sole king in Italy. Many leading men in Lombardy and the Piedmont, particularly the marquis of Ivrea, opposed Berengar's rule. They invited Louis of Provence, Louis II's grandson, to take over the

Italian kingdom. Louis of Provence reached Rome and was crowned emperor, but when he returned to Italy in 905 he was captured by Berengar and blinded. Adalbert of Ivrea mended his relations with his former rival by marrying Berengar's daughter, Gisela. Berengar survived as king for nearly twenty more years by carefully cultivating his wife's Supponid relatives and the supporters of his new son-in-law Adalbert. In 915, he even managed to have himself crowned emperor. Although the royal palace and its officials in Pavia continued to function, Berengar preferred to stay in Verona. From 899 on, Berengar faced a new foreign menace, the Hungarians, whose mounted warriors swept across the eastern Alps virtually unopposed and repeatedly raided the cities and monasteries of the northern Italian plain. Berengar never once succeeded in defeating the Hungarians in battle; in fact, in the 920s he was employing them as mercenaries. The king of Italy could no longer protect the church, the cities, or the greater or lesser landholders. In 923, Rudolf II of Burgundy was persuaded to come into Italy by the growing opposition to Berengar. At the bloody battle of Fiorenzuola d'Arda, Berengar was defeated, and many leading men on both sides were killed. A year later Berengar was executed in Verona. The Frankish kingdom of Italy was in practice finished. The kingdom, or at least the idea of the kingdom, survived, however, and its ideological link with the imperial crown and title tempted German kings into Italy for the next 400 years.

The Franks themselves had little impact on Italy in the eighth and ninth centuries. There were never enough of them to make significant changes in Italian social or economic structures, in law, or in culture. Those who settled in Italy for any length of time became Italian in their outlook and politics. But major changes that would affect Italy for hundreds of years did begin during the 150 years when the Frankish kingdom in Italy functioned. Political power and public authority were divided among regions and cities. Despite being weakened and fragmented by the privatization of lordship, written law and the role of public officials persisted. Urban centers, most of which had survived from Roman times, grew in size and importance during the ninth century. In many of these cities, especially in northern Italy, bishops began to exercise public authority, usually with the explicit support of the king. Cities on the periphery of the kingdom, such as Gaeta and

Amalfi in the south and Venice and Genoa in the north, began to develop commercial ties throughout the Mediterranean, though these would become much more important in later centuries. The Italian countryside also experienced economic development in the ninth century. Under the leadership of the great monasteries and their leaseholders, land was cleared and new vineyards and olive groves were planted in many parts of Italy. It was probably this process of rural development that led to the building of *castelli*, fortified villages, first in central and southern Italy and later in the north as well. This process of *incastellamento* gradually and permanently transformed much of the Italian landscape by the end of the eleventh century.

During the period of the Frankish kingdom, the foundations were put in place for the future papal state. This may be one of the few intended results of Charlemagne's invasion of 773-774. But neither Charlemagne nor the popes could have foreseen how the republic of Saint Peter would develop. In Rome, as elsewhere in Italy, the leading families took over control of the offices of state and the lands surrounding the city. Neither Charles nor any subsequent emperor from beyond the Alps was able to rescue the papacy from the Roman factions. Finally, the Carolingians failed to bring Italy south of Rome into the kingdom, despite the efforts of Charlemagne and Louis II. This failure and the subsequent division between the Italian north and south were to haunt the political development of Italy for centuries.

Frati Gaudenti

The Frati Gaudenti ("jovial friars"), or Knights of Our Lady, were an

Italian military order founded in 1261. The official title of the order was Militia of the Glorious and Blessed Virgin Mary, but its critics dubbed its members *Frati Gaudenti* because of their ostentatious way of life and their casual approach to the rule of the order.

The Militia of the Blessed Virgin was one of several military orders founded in urban settings during the thirteenth century. These differed from older military orders such as the Templars and Hospitallers in that they professed to combat local enemies of the church, especially heretics, rather than external foes like the Muslims. They also differed from the other great urban religious organization of the period, the military confraternity, in that they took a religious vow and maintained an exclusively aristocratic membership. The Militia of the Blessed Virgin was unusual in that it was a revival of an earlier order of the same type: the Militia of Jesus Christ, founded by the Dominican Bartolomeo de' Breganza at Parma during a great devotional movement of 1233. Bartolomeo had hoped that a military order dedicated to orthodoxy would attract the patricians of the northern Italian cities away from the influence of heretics and Ghibel lines and toward the papacy. Initially, his Militia of Jesus Christ had great success and spread quickly to a number of towns, but it was unable to sustain its popularity. By the 1250s, only a few members remained.

In 1260, another great devotional movement swept Italy: bands of penitents practicing ritual flagellation. Societies of flagellants, often dominated by the *popolani*, appeared in many cities. These essentially religious groups soon came to have considerable political influence, particularly because they dedicated themselves to establishing peace among warring factions. This aroused the hostility of urban nobles, who resented the lowborn flagellants' usurpation of the traditional aristocratic function of peacemaker. Soon after the formation of a flagellant society in Bologna, several prominent Bolognese nobles suddenly announced a renovation of the town's nearly defunct Militia of Jesus Christ, now to be called the Militia of the Glorious and Blessed Virgin Mary. This exclusively aristocratic religious organization would be dedicated—like Bologna's flagellant society—to bringing peace to warring factions. Seven patricians, representing both Guelfs and Ghibellines from Bologna, Parma, Reggio Emilia, and Modena, were the official founders of the new order. The influential Franciscan Rufino

Gurgone drafted the rule and guided the petition for papal approval through the curia. When this approval was received, the last members of the Militia of Jesus Christ quickly joined the new order, along with many members of the Bolognese nobility. Loterengo degli Andalò, one of the founders, became the first *prior et prelatus* of the order. The monastery of Ronzano, near Bologna, was established as its seat.

The Militia of the Blessed Virgin proved very successful in countering the flagellant society controlled by the *popolani*. Within a few years of its formation, the militia obtained authority to command Bologna's society of flagellants in military emergencies. Its leaders soon came to dominate peacemaking in the town, displacing the flagellants. Loterengo gained a sufficient reputation to be called to Florence, Prato, and Pistoia to mediate between Guelfs and Ghibellines.

As has already been mentioned, the new Militia of the Blessed Virgin, like the old Militia of Jesus Christ, was restricted to patricians. It included both unmarried brothers who bound themselves with a vow of chastity, common possession, and obedience; and married brothers, who simply swore obedience to their superiors and observance of the rule insofar as the married state allowed. The rule was that of Saint Augustine. From Bologna, the order spread to many cities in Lombardy, Tuscany, Romagna, and the Marca Trevigiana. It was strongest at Bologna, Mantua, Modena, and Treviso.

Although the militia spread quickly, there is not much evidence of fervor among its members. Many lived in luxury, contravening the rule. From its first years, several prominent brothers ignored the rule's prohibition against holding public office. The militia had considerable wealth but built no monasteries, churches, bridges, or hospitals. There is no record of other pious work. By the 1280s, the militia was being called, derisively, the *Frati Gaudenti*. Dante contributed to its negative image by placing Loterengo degli Andalo and another of the order's founders, Catalano de' Catalani, among the hypocrites in hell (*Inferno* 23.82-109). Dante believed that when these men were serving as rectors of the city in 1266 they had conspired with Pope Clement IV to deliver Florence to the Guelfs.

The Militia of the Glorious and Blessed Virgin Mary survived into the sixteenth century. Its last master general, Camillo Volta, died in 1589.

Frederick I Barbarossa

Emperor Frederick I (c. 1123-1190), nicknamed Barbarossa ("red-beard"), was the nephew of his predecessor, Emperor Conrad III, and was a member of two powerful and antagonistic German dynasties: the Welf and the Staufen. The day following his coronation as king of the

Germans (4 March 1152), Frederick proposed an expedition into his Italian territories that would culminate in his coronation as emperor by the pope in Rome. As overlord in northern Italy, Frederick planned to aid Pope Eugenius III against restless Romans; provide justice, peace, and an imperial presence in and among Lombard cities; and confirm his feudal underlings, the Italian counts and bishops. Though he would not descend into Italy until the autumn of 1154, he established a treaty of mutual support with the pope (the treaty of Constance, 1153) and drew up plans to drive the Normans from the Sicilian kingdom. From the start, Frederick had an exalted and ambitious view of the imperial office, and on both sides of the Alps he proved tireless (if unsuccessful) in pressing his claims to full imperial authority and power.

During his first expedition he held court at Roncaglia in Lombardy, seeking to end hostilities between Milan and neighboring cities. Instead, he antagonized the Milanese, and his army looted their countryside before marching south for Rome and the imperial coronation. Frederick met Pope Hadrian IV at Sutri, near Rome, but initially avoided certain ancient rituals that expressed royal vassalage to the papacy; this gave rise to stories that Frederick had insulted the pope. The papal and royal entourage had to sneak into Rome to avoid the antagonistic Roman mob, but Frederick was duly crowned (on 17 June 1155), and he soon had the antipapal Roman leader, Arnold of Brescia, executed. He then returned to Germany, having failed to pacify Lombardy or Rome, and without assaulting the kingdom of Sicily.

Since he had not succeeded as a heroic peacemaker, Frederick decided to carve out a personal domain that would include Burgundy, Swabia, and Lombardy. In these territories he would absorb all previously lost regalian rights, jurisdiction, rights of appointment, rights to full contributions to support his military forces, and even the "minor *bannus*" rights over mills, tolls, markets, coinage, etc. Lombardy responded by organizing alliances and initiating open military defiance when Frederick descended again in the spring of 1158. He received the aid of Bergamo in attacking its rival, Brescia; and he allowed Lodi, which had been destroyed by the Milanese, to rebuild. Milan led a short-lived opposition but capitulated in September, its army beaten and its countryside devastated. The decrees of the Diet of Roncaglia were promulgated in November. These decrees—reached in consultation

with judges from Lombard cities and Bolognese jurists—recognized the communal governments but also outlined Frederick's assertions of the ancient imperial rights that he again invoked. Frederick continued to fight against opposing cities until Milan capitulated once more on 1 March 1162; after this capitulation he had the city razed. As he proceeded through Lombardy, he imposed—even in friendly cities—imperial *podestà* (podestas), many of whom were faithful German *ministeriales*, and this intensified local hostility to imperial interests. Meanwhile, the Lombard opposition was strengthened after the death of Hadrian IV (1159), which resulted in the election of two popes: Alexander III, who supported the Lombards; and the imperial candidate, Victor IV.

Frederick returned to Italy in October 1166. Ignoring pleas for imperial justice against rapacious *podestà*, he took hostages from hostile cities and headed straight for Rome in two columns. By July 1167, he defeated a Roman army and entered the city, driving away Alexander and installing Victor's successor, Paschal III. An outbreak of deadly disease in Rome, however, soon killed many of Frederick's soldiers and followers, and he beat a hasty retreat through hostile Lombardy—recently organized into the anti-imperial Lombard League. From friendly Pavia he banned the Lombard League in September 1167, but to no effect: his allies had defected, and Alexander promised to excommunicate anyone who opposed the Lombard League.

Frederick I Barbarossa. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 203r.

Events in Germany kept Frederick away until 1174, when he led a largely mercenary army against the Lombard League. He destroyed Susa; Asti surrendered; and he besieged the infant city of Alessandria, though unsuccessfully. After a further campaign of tactical maneuvering, Frederick and the Lombard League concluded the peace of Montebello (16 April 1175). Munz (1969) sees this period as the beginning of Frederick's third plan, after his roles as peacemaking lord and effective imperial overlord had both failed. Frederick would now begin to adopt more purely feudal relationships with the communes, reducing imperial interference to a minimum. The peace of Montebello crumbled, however, because Frederick refused to treat with Pope Alexander and because episcopally-led popular risings in several cities undermined the agreement. Open hostilities erupted again in early 1176

and led directly to Frederick's ignominious defeat at Legnano in May.

Frederick quickly turned away from making demands on the Lombards, and instead focused his gaze on the rich Mathildine lands in Tuscany, which he held as a fief from the pope. Following Legnano, he offered to exchange his recognition of Alexander and of the Lombard League and its liberties for full lordship over these Tuscan lands, in which his powerful ally and vassal Christian of Mainz already held sway. This general arrangement led to the treaty of Venice in July 1177 and, six years later, to the more permanent Peace of Constance. With Christian's death in 1183, however, Frederick lost his direct hold over Tuscany, and his lordship there came to mean little in fact.

Frederick's eventual accommodation to the realities of political life in northern Italy proved far more successful than his earlier attempts to rule the region. Frederick is recognized as a sound and flexible politician, yet his inability—or unwillingness—to understand that the members of the communes had developed a deep commitment to their liberties blinded him and prevented him, for a quarter-century, from formulating a satisfactory policy. This blind spot, coupled with his refusal to recognize Alexander as pope and his own perennial need to attend to imperial matters north of the Alps—and to depend on military resources from north of the Alps—ensured that he would not succeed as direct overlord in northern Italy. The successes of the communes proved to be short-lived, as old hostilities and feuding immediately reemerged; but the communes' collective resilience in the face of Europe's greatest monarch led in the longer run to a reinforced communal ethic that would survive for another two centuries and more. The reformed papacy, too, gained from Alexander's triumph over Frederick's opposition; its independence from imperial authority was buttressed if not guaranteed.

In June 1190, Frederick, who was then on a crusade, drowned while crossing the Saleph River near Seleucia in Asia Minor.

Frederick II Hohenstaufen

Frederick II (26 December 1194-13 December 1250) was born at Jesi in the March of Ancona and died at Castel Fiorentino in Apulia. His father was Henry VI (1165— 1197) and his grandfather Frederick I Barbarossa. His mother was Constance (1154 1198), daughter of Roger II Hauteville. After Henry died, Constance accepted papal lordship over the kingdom of Sicily and relinquished royal rights over the Sicilian church. At her death, she named Pope Innocent III (r. 1198-1216) regent of Sicily and guardian of Frederick. Innocent, however, was unable to protect Frederick during his minority. Barons, bishops, abbots, foreign merchants, Templars, Saracens, and the papacy itself exploited his vulnerability. Innocent sent legates to Frederick but consistently put papal lordship over the kingdom ahead of the young king's welfare. In 1199, Markward of Anweiler, a would-be regent and leader of the German nobles in Sicily, took Frederick hostage. After Markward's death in 1202, Frederick passed into the hands of other captors. For the rest of his life, he held the papacy largely responsible for his early misfortunes.

Frederick had a strong mind and great intellectual curiosity. Despite the uncertainty of his early years, he received a good education. He was

literate in Latin and Italian and familiar with Greek and Arabic. He cultivated wide-ranging literary, scientific, and philosophical interests. The harshness of his childhood also made him an astute political realist. Frederick combined unshakable self-confidence with a will of iron. He had an autocratic temperament. He pursued his rights ruthlessly but showed a pragmatic side when it seemed advantageous.

Innocent relinquished his guardianship in December 1208. The pope arranged a marriage in 1209 between Frederick and Constance, the daughter of Peter II of Aragon. The kingdom of Sicily was still intact, but Frederick lost many royal holdings during the papal regency. In Germany his uncle, Philip of Swabia, contended with Otto of Welf for the imperial title. Most of the German princes preferred Philip, whom they elected in 1198; other princes elected Otto in the same year. Innocent, who was fearful of the Hohenstaufen's intentions toward Italy, favored Otto. The murder of Philip in 1208 left Otto predominant, and Innocent crowned him emperor in 1209. Even though Otto vowed to stay out of Italy, he invaded the peninsula in 1210 and by 1211 controlled most of it.

As Otto prepared to attack Sicily in 1211, the Hohenstaufen faction in Germany elected Frederick king. The pope supported Frederick, who threaded his way north through Welf partisans and arrived in Germany in 1212 without money or an army. Many cities and princes welcomed the exotic *puer Apuliae* (boy of Apulia), who confirmed and granted privileges to consolidate his support. In 1213, Frederick confirmed his agreements with the Roman church in the *Golden Bull of Eger*. The defeat by the French of Otto and his ally, John of England, in 1214 accelerated the decline of the Welf fortunes. Otto withdrew to Saxony, where he died in 1218.

Frederick was crowned at Aachen in 1215. At his coronation he took the cross; this enhanced his status but later caused him many problems. Frederick spent five years solidifying his position in Germany and thus was unable to join the Fifth Crusade (1217-1221). After Otto died, Frederick negotiated with Pope Honorius III (1216-1227) for an imperial coronation. Frederick confirmed his concessions to the papacy; vowed to relinquish the Sicilian throne to his son, Henry; and agreed to go on a crusade as soon as possible. In April 1220, Frederick issued the *Constitution in Favor of the Ecclesiastical Princes*, which conferred

fiscal and jurisdictional independence on the German prince-bishops. This act changed very little and secured the support of most German bishops. Frederick had Henry elected king of the Romans in April 1220, thus violating his earlier agreement with Honorius. The pope settled for an administrative separation of the empire and the kingdom of Sicily; he apparently believed that concord between him and Frederick would best advance ecclesiastical liberty, peace among Christian states, and the crusade. Honorius crowned Frederick emperor at Rome on 22 November 1220.

Frederick then moved to reestablish royal control over the kingdom of Sicily. At Capua in December 1220, he published assizes that reaffirmed royal prerogatives. He demanded the surrender of royal charters granted since the death of William II in 1189 and reissued charters to longtime supporters and to those whose support he sought. He nullified the privileges of those who had exploited his childhood weakness and his long absence in Germany. Most of southern Italy and Sicily submitted to Frederick without resistance. He reestablished the system of justice and taxation that had been in force under the Norman kings. He founded the University of Naples in 1224 to train lawyers and bureaucrats for government service.

Frederick placed control of the Sicilian kingdom ahead of all other considerations. He deprived the church, the nobility, and foreign merchants of many lucrative privileges. Jews and Muslims received limited protection when it served royal policy. Frederick defeated the Muslims of western Sicily in 1221-1223 and transported them to Lucera in northern Apulia. He allowed them to govern themselves and to practice Islam as long as they cultivated royal lands and served in the royal army. By 1225, Frederick was in firm control of the kingdom, although for the rest of his life he faced periodic rebellions against his autocratic regime.

The crusade dominated relations between the papacy and the empire during the 1220s. Frederick failed to join the crusaders who had seized the Egyptian city of Damietta in 1219. Command errors doomed the Fifth Crusade, but Frederick was blamed when Damietta fell in 1221. Honorius excused Frederick but insisted that he soon launch his promised crusade. In 1225, Frederick vowed, on pain of excommunication, to depart on a crusade, with a large force and a full

treasury, by mid-August 1227. Frederick married Isabella (or Yolande, his second wife), the queen of Jerusalem, in 1225; this marriage allowed him to claim the title of king of Jerusalem. Conflict between Frederick and the communes of northern Italy, however, complicated his preparations for the crusade. In 1226, the emperor called an imperial diet at Cremona to promote the crusade, suppress heresy, and assert imperial rights in Italy. Many Lombard cities suspected that Frederick intended to dismantle their hard-won urban liberties. They formed a new Lombard League and blocked the Alpine passes to German forces. Frederick asked the pope to mediate to resolve the conflict. Honorius, who feared that war in Italy would stall the crusade, sent a legate to press the cities to settle with the emperor. The Lombard League reluctantly ratified a truce in March 1227.

This era of concord between the papacy and the empire ended with the death of Honorius in March 1227. His successor, Gregory IX (1227-1241), was an unbending proponent of papal supremacy and considered Frederick the principal threat to the Roman church. Gregory insisted that the emperor fulfill all his agreements with the church or suffer excommunication. A serious illness prevented Frederick from departing on the crusade in 1227; Gregory excommunicated him and launched a propaganda attack that stressed the liberties of the church far more than the crusade. The only practical way for Frederick to vindicate his position was to fulfill his vow to undertake a crusade. He departed for the Holy Land in June 1228, despite the fulminations of the pope. Frederick met resistance from the nobility of the kingdom of Jerusalem, the Latin hierarchy, and the Templars and Hospitallers. He did little campaigning in Palestine. Rather, he continued negotiations with Al-Kamil, the sultan of Egypt, that had begun in 1226. Frederick persuaded Al-Kamil to deliver Jerusalem, Bethlehem, and Nazareth to him. In return, the emperor agreed not to fortify Jerusalem and guaranteed access to Muslim holy sites. Frederick crowned himself king of Jerusalem in the Church of the Holy Sepulchre in March 1229.

An invasion of the kingdom of Sicily by the *papacy* late in 1228 forced Frederick to leave the Holy Land soon after his coronation. Gregory intended to depose Frederick and rule the kingdom directly from Rome. The pope also tried, though unsuccessfully, to recruit an antiking in Germany. A rumor that Frederick had died on the crusade contributed to the early success of the papal army, but the emperor quickly recovered his kingdom after his return in June 1229. During the peace negotiations, Frederick scrupulously respected the dignity of the pope. The peace of San Germano and Ceprano in 1230 lifted the excommunication and confirmed papal lordship over the Sicilian kingdom.

Frederick and Gregory cooperated closely, if warily, from 1230 to 1235. The emperor wanted the pope to support him against the Lombard League as Honorius III had done in 1226. The pope wanted imperial forces to suppress the Roman nobles who had driven him from the city in 1228. Their mutual need produced an uneasy peace. Gregory prodded the Lombards to settle with Frederick until the pope made a separate peace with his Roman adversaries in 1235. Gregory then began to defend the Lombards, who were longtime allies of the papacy against the German emperors.

In 1235, Frederick's son Henry revolted against imperial authority in

Germany. Although Frederick easily defeated Henry, he reconfirmed the *Constitution in Favor of the Secular Princes*, which Henry had granted in 1231. Frederick thereby secured the support of the German princes against the Lombard League. He also made a bid for English support by marrying his third wife, Elizabeth, the sister of Henry III, in 1235. Frederick conducted three campaigns in northern Italy from 1236 to 1238. His greatest victory was at Cortenuova in November 1237. The harsh terms that he then offered to Milan and its allies prolonged the war and led to a defeat of the imperial forces at Brescia in October 1238. Soon afterward, Gregory abandoned his pose as a neutral mediator and cast his lot with the Lombards. The pope excommunicated Frederick on 20 March 1239. A bitter war of words accompanied the hostilities in the field. The pope preached a crusade against Frederick in 1239-1240. In 1241, he convoked a general council in Rome to depose Frederick, but the imperial fleet captured most of the council fathers. Gregory died in August 1241, as Frederick closed on Rome. Gregory's successor, Celestine IV (1241), died after less than a month in office. A two-year papal interregnum ended with the election of Innocent IV (1243-1254).

Frederick immediately began to negotiate with Innocent IV to lift the excommunication, but the pope fled to Lyon with the Roman curia in 1244 to avoid being coerced by the emperor. At the First Council of Lyon in 1245 Innocent deposed Frederick on charges of sacrilege, violation of ecclesiastical liberties, and suspected heresy. This sentence weakened Frederick, but not decisively. The war against the Lombards dragged on inconclusively for the remainder of his life. Innocent sponsored two German antikings, but they had little success against Frederick. Several conspiracies against the emperor further embittered Frederick against the pope and alienated him from important members of his court, notably Pier della Vigna. Frederick was on the offensive in Italy when he died of dysentery at Castel Fiorentino in 1250. He lies with his father and his Norman ancestors in the cathedral of Palermo.

Frederick II was the last great medieval emperor. His struggle with the papacy continued after his death and resulted in the virtual extinction of the Hohenstaufen. Only his granddaughter, Constance, survived to legitimate the claims of her husband, Peter III of Aragon, to the kingdom of Sicily. Frederick left a storehouse of imperialist

jurisprudence that later kings and emperors applied in their struggles with the papacy. Frederick was also a great lawgiver. His *Liber Augustalis* (*Book of the Emperor*, 1231) codified and expanded the laws of the kingdom of Sicily. It was often included in late medieval and early modern editions of *Corpus iuris civilis* (the civil law code). Frederick was an accomplished builder of military fortresses (e.g., Castel del Monte) and an active patron of scholars, artists, and poets. He delighted in intellectual discourse and was himself an Italian poet of middling ability. His manual of falconry, *De arte venandi cum avibus* (*On the Art of Hunting with Birds*), remains a standard in the subject.

Frederick's enthusiasm for learning and the arts and his worldly reputation have misled many scholars, who characterize him, inaccurately, as a proto-Renaissance prince. Papal propagandists depicted him as a dangerous freethinker or heretic, but Frederick was a fairly conventional Catholic ruler who persecuted heretics fiercely and took the greatest pride in his success as a crusader. During the later Middle Ages, his significance was regarded variously. Many Joachites and Spiritual Franciscans identified him as the emperor of the last days, the scourge of a corrupt hierarchy. Dante respectfully referred to Frederick as the "last emperor of the Romans" in his commentary on nobility and law in *Convivio* (*The Banquet*, 4.3.6) but consigned Frederick to the sixth circle of hell among the Epicurean heretics for his reputed skepticism about life after death (*Inferno* 10.119). German folklore merged him with Frederick I Barbarossa as the sleeping emperor who would rise up to defend his people in their moment of greatest need.

Frederick II inherited a tradition of Norman kingship that gave him a powerful instrument of government and a familiarity with cultures which seemed strange to much of the Latin west. His ideas about the place of the empire in the right order of Christendom derived from his Hohenstaufen legacy. His early attempts to forge an equal partnership with the papacy were as true to that legacy as his later challenges to papal political supremacy. Frederick II became the template for resistance to the political claims of the papacy, despite his failure to secure a place for himself and his dynasty in Italy.

Frederick III, King of Sicily

Frederick III of Sicily (or Frederick II, 1272-1337) was the youngest son of Peter III the Great, king of Aragon, and appeared to have benefited least from his father's will when Peter died in 1285. Aragon, Valencia, and Catalonia were bequeathed to Frederick's eldest brother, Alfonso; and Sicily to the middle brother, James. However, Frederick's moment came in 1291, when Alfonso died without heirs; James did not separate Sicily from his realms, but he knew that he could not defend it against Spain single-handed and so left Frederick in charge as lieutenant-governor.

At this point James was eager to put to an end the continuing strife

between the house of Aragon and the French, who as allies of the Angevins still posed a considerable threat to his Spanish lands; he also sought to make his peace with the papacy. He thus concluded that a compromise with the Angevins over the future of the island of Sicily was essential. In 1295, James agreed to abandon Sicily to Charles II of Anjou and to take Sardinia and Corsica instead; Frederick would leave his post and marry into the family of the deposed Latin emperors of Constantinople, so that he could make his fortune in the east. Such an agreement could not bind the Sicilians, who had fought hard for their independence from Naples. In 1296, a Sicilian parliament enthusiastically offered a crown to Frederick, who thus became Frederick II of Sicily and called himself Frederick III because he sought to be, like his great-grandfather the Holy Roman emperor Frederick II, a focus for Ghibelline sentiment in Italy.

James lived up to his side of his arrangement with the papacy and supported the Angevins in their war against Frederick, though he avoided committing himself heavily and maintained a cordial correspondence with Frederick about family matters. The Angevins landed in Sicily in 1298, but they were never able to secure a firm foothold, despite support from the navy of the Aragonese admiral Roger de Lauria. In 1302, the treaty of Caltabellotta secured Sicily for Frederick, though he was obliged to withdraw from his mainland conquests and to accept the title "king of Trinacria," a literary artifice meant to ensure that there would not be two kings of Sicily, one on the mainland and one on the island. Under the treaty, "Trinacria" was to revert to the Angevins after Frederick's death, and a marriage alliance was to bind him to the Neapolitan royal house.

Although this put an end to the war of the Vespers, it did not end attempts by James II of Aragon and others to persuade Frederick to take another crown, whether in Sardinia or Albania, in the hope that Sicily would be ceded to Naples. Contemptuous of such initiatives, Frederick concentrated on rebuilding the economic and religious life of Sicily, which had suffered in the twenty-year war against Naples. He tried to reinvigorate religion after a long period of interdict; personally pious, he was known as a patron of the radical Spiritual wing of the Franciscan movement. He acted severely toward the Jews of Sicily, planning at one point to move the Jews of Palermo into a ghetto. He

reformed weights and measures and the system of trade taxes. His generosity to towns, which included edicts exempting them from certain tolls, brought him popularity and may have stimulated urban growth; however, it also weakened the traditionally strong position of the crown relative to the cities. Powerful baronial factions, the germ of the future Catalan and Latin factions, began to emerge, including elements favorable to an Angevin restoration. The situation was not helped by the continuing raids from Angevin Naples, or by Frederick's decision in 1322 to elevate his son Peter to the office of co-king, thereby trampling on the stipulation that the island would revert to the Angevins of Naples when he himself died. Between 1325 and 1327, the Angevins made further major attempts to invade Sicily; Frederick was thus unable to provide his kingdom with the peace the Sicilians craved.

When Frederick died in 1337, a succession of short reigns followed, during which the increasingly evident weakness of the crown was accentuated, in the face of the power of the Palizzi, the Chiaramonti, and other great noble dynasties.

French Language in Italy

Practical and cultural contacts—especially the continuous pilgrimages to Rome, the crusades, and the Cluniac and Cistercian foundations, as well as commerce and literature—contributed to the dissemination of a certain knowledge of French in medieval Italy.

In southern Italy, the influence of the French-speaking Normans was quite important, and knowledge of French was indispensable at their courts. Count Henry of Montescaglioso, for example, did not know French (*Francorum se linguam ignorare, quae maxime necessaria esset in curia*: "he doesn't know the French language, which is most necessary at the court") and for that reason refused the function of regent during the minority of William II the Good of Sicily (r. 1172-1189). Furthermore, the political-administrative influence of the Angevin regime (1266-1442) kept French language and culture alive in the kingdom of Naples for a long time.

Northern Italy was even more exposed to the influence of French. This was especially true in Piedmont, because of its geographic situation, providing two approaches to the three major passes in the western Alps (Great Saint Bernard, Little Saint Bernard, and Mont Cenis); because of its repeated military occupations; and because of its dynastic ties with Savoy—its counts held Susa as early as the eleventh century. The influence was particularly strong in Asti, which was held by the French until the sixteenth century. In the Aosta and Susa valleys, although a French dialect is still spoken there today, written documentation—in literary French—does not start until the sixteenth century. However, in northeastern Italy (Cremona, Verona, Vicenza, Padua, Venice) we find a peculiar phenomenon during the medieval period: the language called Franco Italian. In Franco-Italian literature, there are different degrees of hybridization of French texts with Italian dialects. *Chansons de geste*, such as the epic *Chanson de Roland*, offer striking examples. Here is an excerpt from the Franco-Italian version of *Chanson de Roland* (verses 1864-1867):

*Rollant à messo l'olinfant a sa boqe,
Inpinç il ben, per gran virtù lo toce;
Grand quindès leugue la vox contra responde,*

("Roland put the *olifant* [horn] to his mouth; he gave it a good blow; it sounds with great strength; the echo resounds fifteen miles around; Charles and all his companions hear it.") This artificial language is attested to in the poetry and prose of the region from the twelfth century to the fourteenth.

In the thirteenth century, we also find a mixture of Tuscan and French, which seems to have been limited to literature and was used specifically to ensure that a story would have a large audience. Worth mentioning in this context are *Livre dou tresor* (c. 1265) by Brunetto Latini; *Il milione* (1298) by Marco Polo, or rather Rustichello da Pisa; an adaptation of the *Roman de la Rose* entitled *Ilfiore* (after 1284), possibly by Dante; and *Intelligenza* (end of the thirteenth century), an anonymous allegorical treatise. Also important are the frequent commercial contacts, especially with Champagne, evidenced by several Florentine account books. The name of Saint Francis of Assisi—Francesco—and his knowledge of French, attested to by his biographers, reflect his father's commercial ties with France. In addition, one must consider the important relations with the papal court at Avignon in the fourteenth century, as well as the French fashions and customs at the court of Naples.

But there was also a reaction. Dante's diatribe against the presumed superiority of foreign languages in *Il convivio* (1.11) is well known. Dante's younger contemporary, the Siennese Cecco Angiolieri (c. 1260-1312), satirized the French fad in the sonnet *Quando Ner Picolin tornò di Francia*; and Franco Sacchetti (c. 1330-1400) wrote a *caccia* in which there is a character who speaks an affected, frenchified Italian. Benvenuto da Imola (d. 1388), in his *Comentum super Dantis Comoediam* (Book 2, p. 409), considers those who admire the French language stupid, *nam lingua gallica est bastarda linguae latinae* ("for the French language is a bastard of the Latin language"). Petrarch, when he was sent to the king of France in 1361, apologized for speaking Latin rather than French: *linguam gallicam nec scio nec facile possum scire* ("I don't know the French language, nor can I learn it easily").

Frescobaldi, Dino

Dino Frescobaldi lived between 1271 and 1316 and was, in the words of Giovanni Boccaccio, *in quegli tempi famosissimo dicitore per rima in Firenze*. "at that time a very famous composer of rhyme in Florence." Dino came from a family of poets. His brother Giovanni, his son Matteo, and his father, Lambertuccio, a prominent Florentine banker, also composed verse. In *Trattatello in laude di Dante*, Boccaccio credits Dino Frescobaldi with having recovered the first seven cantos of the *Inferno*, which Dante had left in Florence when he was exiled. That episode alone would guarantee Dino's place in Italian literary history,

but he is also considered a key figure in the evolution of the *dolce stil novo* in the aftermath of Cavalcanti's death and during the years of Dante's exile. Boccaccio's favorable opinion of Dino Frescobaldi's poetry was supported by Pietro Bembo in *Prose delta volgar lingua*.

Dino's known poetic output consists of twenty-one poems (five *canzoni* and sixteen sonnets) that have been handed down to us in ten manuscripts, the most important of which is a famous collection of *stilnovo* poetry, Vaticano Chigiano L.VIII.305. Love is the dominant theme of his poetry; like Dante, Dino is infatuated with a young and beautiful woman, whose identity is unknown, suggesting that she is perhaps a literary creation. Dino is, above all, a Cavalcantian poet who effectively represents his psychological struggle with love. His reverence for Dante and Cavalcanti is evidenced by the fact that he borrows their themes and their vocabulary. In comparison with the poetry of other *stilnovisti*, however, Dino's poetry tends to be descriptive rather than lyrical in its representations of love, as in the sonnet *No spero di trovar giarnmai pietate*. Brugnolo (1984) has pointed out that Dino's syntax is contracted and analytical compared with that of other *stilnovo* poets, who tend to write in longer, more fluid sentences. In another sonnet, *La foga di quell'arco, che s'aperse*, Dino emphasizes tension by using vibrant metaphors and by juxtaposing harsh-sounding words. Besides reminding us of Dante's *rime petrose*, the sonnet reveals that Dino is less concerned with abstract considerations of love than with representing his own internal emotional and intellectual conflict. Scholars have suggested that Dino Frescobaldi has much in common with Cino da Pistoia, who was reared on *stilnovo* poetry and belonged to the generation of younger poets that moved away from speaking abstractly about love and began to represent its tangible effects on the lover. Dino's poetry is not characterized by idealistic, transcendental fervor. Rather, it reflects a secular interest in the theme of love. Poets such as Cino da Pistoia and Dino Frescobaldi, while continuing the *stilnovo* tradition, paved the way for a new poetic sensibility that was epitomized in the poetry of Francesco Petrarca.

Frescobaldi Family

The Frescobaldi came to Florence from the Val di Pesa c. 1200. Like other rural nobles who migrated to the city, they were soon active in

commerce and politics. By 1240, they were represented in the three most important guilds in Florence: the Lana, Calimala, and Cambio. In 1252, Lamberto Frescobaldi was elected to the *anziani* (elders), and in 1285 Ghino Frescobaldi was chosen as one of the priors. Other members of the family served as ambassadors to various Italian city-states and to the papal court. Even after the Frescobaldi and other magnates were banned from major public offices under the Ordinances of Justice of 1293, the family remained active in Florentine politics. They were ubiquitous in the minor posts still open to them, especially the position of *podestà* in the subject towns of the Florentine *contado* (hinterland). More important, they exercised considerable informal influence through their wealth and through their commercial and marital ties to important families of the *popolani grassi* such as the Capponi and the Guadagni. Relatives and business partners of the Frescobaldi appear repeatedly in the lists of Florentine officials from the late thirteenth century onward.

The wealth, and therefore the power, of the Frescobaldi derived from their commercial success. Combining trade, especially in wool and cloth, with banking, the Frescobaldi were active in Naples, Padua, Ferrara, Avignon, London, Paris, Bruges, and the Tirol as well as Florence in the thirteenth and fourteenth centuries. At times there were a number of Frescobaldi companies operating simultaneously, often in competition with each other. In England, the company headed by Berto Frescobaldi but managed locally by his sons Amerigo and Bettino succeeded the Riccardi of Lucca as the chief bankers of Edward I and Edward II, supplying the crown with ready funds in return for control of the wool customs and other sources of royal revenue. With royal patronage, the family soon became very powerful, acquiring offices, lands, and ecclesiastical benefices. Like the Riccardi, the Frescobaldi eventually suffered financially as a result of their involvement with the English crown. When the Lords Ordainers seized power in 1310, Amerigo and his brothers were stripped of their offices and privileges, were imprisoned in the Tower of London, and were fortunate to escape with their lives. Some historians have assumed that bankruptcy must have been the inevitable result of the English debacle; but Donato Velluti, a relative by marriage of the Frescobaldi, records in his *Chronicle* that one branch of the family at least managed to survive

with much of its wealth intact.

There is some indication that the Frescobaldi, like other Florentine merchant bankers, placed part of their capital in safer investments such as land and the *monte* after 1350; however, they continued to be involved in international trade and banking until well into the sixteenth century. Likewise, the Frescobaldi appear again and again in Florence's internal conflicts from the thirteenth century until the fifteenth, either among the supporters of the government or among the opposition, and sometimes on both sides. Berto Frescobaldi was a bitter personal enemy of Giano Della Bella and opposed the institution of the popular regime of the 1290s. According to Dino Compagni, Berto was the leader of a group of magnates who plotted to overthrow the new government. In the violent struggle between the Blacks and Whites that divided Florence in the first decade of the fourteenth century, different branches of the Frescobaldi family took opposing sides.

When the expansionist policy of the Florentine republic threatened the commercial interests of the merchant bankers in 1340, the Frescobaldi and the Bardi attempted a coup aimed at putting the government in the hands of the great merchant banking families and redirecting the course of Florentine foreign policy. They were exiled after the coup failed, and they were not able to return to Florence until the regime of Walter of Brienne, duke of Athens, in 1342. Like some other magnate families, the Frescobaldi were able to profit from Walter's rise and then from his fall, skillfully trimming their sails to suit the prevailing wind. Berto Frescobaldi the younger served Walter as *podestà* and castellan and was chosen as one of the magistrates of the temporary government that followed after Walter was overthrown. In 1360, less than twenty years after their return from exile, the Frescobaldi participated in another abortive coup and again suffered temporary banishment. In the early fifteenth century, they were closely associated with a political faction led by the Albizzi that opposed Cosimo de' Medici.

Frescobaldi, Matteo

Little is known about the life and work of the Florentine poet Matteo Frescobaldi (c. 1297-1348). His father was the *stilnovista* Dino Frescobaldi and his grandfather, Lambertuccio Frescobaldi, composed sonnets in the style of Guittone d'Arezzo. Matteo was fined in 1334 for illegal possession of a weapon. In 1340, the Frescobaldi family took part in an attempt to oust the Florentine captain of the guard, Iacopo de' Gabrielli da Gubbio. When the coup failed, the Frescobaldi fled Florence. They returned in 1342 during an amnesty decreed by the duke of Athens, Walter (Gualtieri) di Brienne, who had come to power that year. On 28 September 1342, Matteo and several relatives signed a peace agreement with members of the Bostichi family, with whom they had been feuding for many years.

Scholars have expressed doubt concerning the authenticity of the poems attributed to Matteo Frescobaldi. The manuscripts containing these poems were copied long after his death, and in several instances the poems are anonymous or are included among works of little-known poets. Hence, according to Li Gotti (1947), Matteo's actual corpus is quite small: two *canzoni*, one *ballata*, and eight sonnets. Corsi (1969) also states his reservations about the textual tradition of the *rime*.

At the same time, however, Corsi emphasizes the originality of

Matteo's interpretation of love (p. 79). Whereas his father, Dino Frescobaldi, idealized young women, Matteo expresses his own preference for widows in the sonnets *Com piú riguardo l'onesta bellezza* and *La dolce donna che sotto tier' ombra*. Andreas Capellanus formulated a theory about the love of widows, and after Matteo Frescobaldi this theme became popular among several fourteenth-century poets: Giovanni Boccaccio, Antonio Pucci, Niccolò Soldanieri, and Giovanni Pigli (Corsi, pp. 79-80). Matteo also composed two political *canzoni*: *Cara Fiorenza mia, se l'alto Iddio* and *Molto m'allegro di Firenze or io*. The first is a veiled invective against the government of the tyrant Iacopo de Gabrielli and is marked by a forceful representation of competing emotions: anger, pity, shame, and love. The second demonstrates Matteo's talent for satire and irony.

Frezzi, Federico

The Dominican friar and theologian Federico Frezzi (c. 1346-1416) was born in Foligno (Perugia) and died while attending the Council of Constance in Germany. He lectured on theology at the universities of Florence, Pisa, and Bologna; became bishop of Foligno in 1404; and was a humanist at the court of Ugolini Trinci of Foligno. Frezzi is known for *II quadriregio del decorso della vita umana*, an allegorical and encyclopedic poem written between 1394 and 1403. In this work, which was modeled on Dante's *Divine Comedy*, Frezzi narrates a journey through four realms; those of Love, Satan, Vice, and Virtue. Like Dante, Frezzi uses the tercet as the strophic unit in the seventy-four cantos of *II quadriregio*.

In the first book, the poet-wayfarer is guided by Cupid through the kingdom of Love. There, he fails in love with Filena, a nymph who is transformed by the goddess Diana into an oak tree. The climax of the first book is a description of a banquet held in Diana's honor, at which the poet becomes infatuated with Lippea, a nymph in Juno's entourage. Minerva, however, exhorts him to suppress his passion, and in the second book Minerva guides him through the realm of Satan. With Minerva's help, the poet ascends to earth and wages battle with Satan, ultimately defeating him in a struggle that symbolizes the victory of humility over pride. After visiting the kingdom of the seven deadly sins, the poet arrives in the earthly paradise. From there, he is guided by the prophets Elia and Enoch through the kingdom of the cardinal virtues and theological virtues. In the last cantos of the poem, Charity explains the order of the universe to the poet and leads him to a vision of God.

II quadriregio and the *Divine Comedy* have several structural and thematic features in common. Most notably, Frezzi uses the poet-wayfarer as the protagonist of the quest for salvation; he also uses guides and describes a vision of hell, the earthly paradise, and the heavens. Aesthetically, however, Frezzi falls short of his model. *II*

quadriregio is laden with moral didacticism and abstract imagery. Indeed, Sapegno (1973, 130) describes it as a partly unconscious parody of the *Divine Comedy*. Whatever its shortcomings, though, *II quadriregio* is worthy of critical attention because it demonstrates the tension within a sensibility influenced both by secular humanism and by a profound affinity with Dante's worldview.

Fustians

Owing to a limited scale of cultivation, cotton cloth was a luxury in the ancient world. In the wake of the Arab conquests, however, the acreage devoted to cotton crops expanded exponentially across the old world. This was a direct result of the agrarian policies of Muslim rulers, which included laws favoring irrigation and land improvement. By the late Middle Ages, cotton cultivation had reached its maximum historical extension within a zone that stretched from China to Spain and from India to central Asia. The extraordinary expansion of cotton cultivation was paralleled by a proliferation of urban centers of cotton weaving and the widespread adoption of cotton fabrics by all classes of Muslim society.

The opening of new commercial routes in the Mediterranean in the late eleventh century facilitated the importation of Muslim cotton fabrics, which appealed to a growing class of urban consumers in western Europe. Knowledge of cotton weaving spread from Sicily to central Italy and Tuscany, where minor guilds of artisans used cotton, imported through Pisa and Ancona, in the production of sailcloth and specialized apparel such as veils. An even more rapid assimilation of advanced tools and techniques from the Islamic world took place in northern Italy. Merchant entrepreneurs from the populous towns of the Po Valley were the first to establish a large-scale, export-oriented cotton industry on European soil.

Unlike the decentralized Islamic industry that developed in the primary zones of cotton cultivation, the industry in northern Italy depended on distant sources of raw materials. The Italian merchants became the primary carriers in the medieval cotton trade. The ports of Venice and Genoa and the river system of the Po provided an efficient commercial network for the low-cost transport of bales of raw cotton. Cotton accounted for a substantial percentage of cargoes entering the ports of Venice and Genoa. Imports included the prime grades of Syria,

Palestine, Greece, and Lesser Armenia, as well as the lower-ranked varieties of western Anatolia, Calabria, Apulia, Sicily, Malta, North Africa, and southern Spain. The various grades of cotton were never mixed. Instead, they were utilized separately for the production of a sophisticated range of fabrics accessible to a broad spectrum of buyers.

The output of a large volume of low- to medium-priced fabrics destined for mass consumption was made possible through a standardization of products and implements and through a regional division of labor. Warp threads and yarn made in standard lengths and counts by peasant women in rural areas of Lombardy were distributed by specialized merchants to urban entrepreneurs who guided the processing of cloth through various stages from weaving to dyeing and pressing. These steps required a large and diversified labor force, which numbered several thousands in the prime industrial cities.

The adoption of common norms of production contributed to the commercial success of the industry. The growing demand for Italian fustians in regional and international trade was in part a response to aggressive marketing of a diversified line of recognized brands. Each type of cloth was identified by trademarks, affixed by guild and city inspectors, that guaranteed uniform quality and workmanship. The generic Italian term *fustagno* (derived from Arabic) referred to the entire range of pure cotton and mixed cotton fabrics produced by hand-loom weavers. Many Italian fabrics were made in imitation of Muslim prototypes such as buckram or muslin. To these, the producers added their own brand names and specialties. In European markets a variety of bleached, dyed, and patterned cotton fabrics, in standard weights and dimensions, competed with linens for use in apparel and household goods. Flannelettes provided an affordable alternative to medium- and low-priced woolens, as did quilted cottons, which were widely adopted for military tunics. Heavy cotton canvas was used for sailcloth on Mediterranean ships, while coarser grades were used for sacks and packing materials. Mixed fustians with warps of linen, hemp, wool, or silk extended the range of designs and options for discriminating customers.

Through the early fourteenth century, the principal markets for Italian producers were north of the Alps. However, Italian fustians also competed directly with Islamic cotton goods in Mediterranean trade.

Large quantities shipped to the North African ports of Tunis and Bougie were destined for the Saharan caravan trade. Italian-made cottons often functioned as currency in the Black Sea ports. Consignments of Italian fabrics were exported to territories held by the crusaders in the eastern Mediterranean, as well as to Greece, Sicily, and southern France.

The hegemony of the Italian cotton industry was challenged in the fourteenth century by new production centers that arose in southern Germany, including Ulm, Augsburg, and other, smaller towns. Initially, German *barchent* were deliberate imitations of Italian brands, marketed under names and trademarks copied from the originals. *Barchent* were woven in the surrounding country districts and finished and inspected in urban workshops. In many traditional outlets, ordinary Italian fustians lost ground to lower-priced German goods. Despite intense price competition, Italian producers retained a share of the market by virtue of superior dyeing and finishing techniques. However, in the course of the fifteenth century, the fulcrum of production was displaced from the towns to the Italian countryside (in Lombardy, the Piedmont, and the hinterland of Genoa), which offered the advantages of cheap labor and freedom from guild legislation. Following the decline of the northern Italian and southern German urban textile industries after 1550, the proto-industrial production of cotton goods persisted in rural Lombardy until the industrial revolution.

G

Gaddi, Agnolo

Agnolo Gaddi (c. 1350-1396) was the son of the Florentine painter Taddeo Gaddi and himself occupies an important place in the history of Florentine painting. Agnolo ran one of the largest workshops in Italy in the 1380s and 1390s and produced some of the best and most important works of the time. Although a number of artists working in Florence in the last quarter of the 1300s—such as Giovanni del Biondo, Antonio Veneziano, and Spinello Aretino—were pursuing similar lines, it was Agnolo who most forcefully redirected Florentine art away from the stiff, austere idiom of mid-century painters such as Andrea Cione (Orcagna) and his brothers. Agnolo's redirection led, on the one hand, to a more decorative, lyrical style in his large-scale narratives, paving the way for the elegant patterns and ornate richness of Lorenzo Monaco and Gentile da Fabriano in the next century. On the other hand, it led to a more naturalistic, monumental style in his panel paintings, pointing toward the heroic conceptions of Donatello and Masaccio in early Renaissance Florence. Agnolo's contemporaries may have been sensible of his revival of Giotto's monumentality after an interval of harsh, planar abstraction, for in *Il libro dell'arte* (late *Trecento*) his pupil Cennino Cennini pointedly declared Agnolo's direct descent, through his father, from the tradition of Giotto.

Little is known of Agnolo's artistic formation or his early career, although the influence of his father, Taddeo, on his style is unmistakable. Agnolo is first documented in 1369 among a group of pupils working under his brother Giovanni on decorations (now lost) for the Vatican Palace in Rome. His earliest documented work for Florence dates from as late as 1380, when his career must have been in full stride; this was an Annunciation (also lost) painted for the hospital of the Bigallo. Vasari (1568) attributed the choir frescoes of Santa Maria del Carmine to Agnolo, as an early work, but no documentary evidence

supports this ascription of the cycle (which, again, is now lost).

Much of Agnolo's subsequent documented activity in the 1380s and 1390s has to do with works designed but not executed by him and constitutes a perfect example of the diverse commissions a medieval workshop typically received, and of the collaborative nature of the art it produced. These works include drawings for a number of sculptural programs, such as a series of virtues for the Loggia de' Lanzi and apostles for the facade of the cathedral in Florence; plans for equestrian monuments to John Hawkwood and Pietro Farnese; and a series of stained-glass windows, again for the cathedral of Florence. Among the many commissions directly executed by Agnolo and his workshop, some of the more important are frescoes of the *Life of Saint John the Evangelist* in the Capella Castellani in Santa Croce (c. 1384) in Florence; a polyptych, the *Coronation of the Virgin* (early 1380s; the central portion is now in the National Gallery in London); the fresco cycle *Legend of the True Cross* in the choir of Santa Croce in Florence (1388-1393); frescoed decorations (done in collaboration with Niccolo di Pietro Gerini and Ber-tozzo di Bartolomeo, documented 1391) for the palace of the merchant Francesco di Marco Datini in Prato; frescoes of the *Story of Mary and Her Sacred Girdle* for the Cappella della Sacra Cintola in Prato Cathedral (documented 1392-1395); and an altarpiece for the chapel of Saint Minias in San Miniato al Monte in Florence (documented 1394-1396).

A panel painting such as the *Madonna and Child with Four Saints and Angels* (now in the National Gallery of Art in Washington, D.C.) shows Agnolo's renewed interest in Giottesque form. In color, compositional structure, and even content, this altarpiece reasserts the accessible, humane, believable godhead depicted during the early *Trecento*. Mary directly addresses the viewer with a warm gaze as she presents the Christ child. Her throne is firmly planted on the ground and projects forward into space, as in Giotto's *Ognissanti Madonna*. Agnolo's work is similar to the *Ognissanti Madonna* in another way as well: the worshipping angels kneel at each side of the throne so that a viewer kneeling before the altarpiece completes the circle of adoration. The saints and angels at the sides either return our gaze to or help focus our attention on the central characters. All the figures, with their ample proportions and broad folds of drapery, are carefully modeled to

emphasize their material presence; and although the horizontal band of carpeting is still patterned in the flat two-dimensional manner of paintings from the 1350s and 1360s, the upper part of this band is shaded as if receding into the distance, suggesting a breadth of space surrounding the four saints. In Agnolo's compositions, color is applied in large blocks, helping to convey the structure of the forms depicted; and soothing light-toned color harmonies of pink, yellow, and green—unlike the strident color relationships of many works by the Cione brothers—give Agnolo's paintings an airiness that is one of the hallmarks of his style.

Gaddi, Taddeo

Taddeo Gaddi (fl. mid-1320s, d. 1366) was the leading painter of the Florentine school after the death of Giotto in 1337, as early sources and documents confirm. In the general literature, Giotto continues to overshadow this very capable artist, but specialists have long recognized not only Taddeo's continuation of Giotto's monumental style but also his innovative, earthy wit; his subtle understanding of light and color; and his extensive and varied work in fresco, panel painting, and window design.

About 1330, Taddeo matriculated in the Arte dei Medici e Speziali. Between 1331 and 1337, the account books of the Bardi banking company (Ser Miniato di Ser Biagio Boccadibue, 1322-1343, Archivio di Stato, Notarile antecosimiano B 1951) note that Taddeo decorated Gualterotto di Jacopo de' Bardi's chapel of Saint Louis of Toulouse and Saint Louis of France at Santa Croce in Florence. Nothing of this project remains. The first documented extant painting by Taddeo is from 1334: a signed and dated beautiful small, portable triptych (now in Berlin, Gemaeldeg. 1079-1081). This work is in the tradition of Bernardo Daddi and suggests Taddeo's interest in the less monumental form that was then gaining popularity.

The major extant fresco cycle attributed to Taddeo from these early years is in the Baroncelli Chapel at Santa Croce. Its chronology is debated by scholars. The earlier suggested date, February 1328, is based on a tomb inscription in the chapel, for members of the Vanni and Baroncelli families. The later possible date, the 1330s, is based on a series of documents associated with the Augustinian friar Simone Fidati, believed by some scholars to have inspired the iconography of the cycle. These frescoes— which are devoted to the life of the Virgin— exemplify Taddeo's early style. Although Taddeo was influenced by Giotto's cycle in the Peruzzi Chapel in Santa Croce, he is more fascinated with pictorial space, lighting, and lively anecdotal episodes than Giotto, who favored greater psychological subtlety. As Ladis (1982) has noted, Taddeo's *Marriage of the Virgin* seems to refer considerably to the *mattinata*, the shivaree that satirized widowers' marriages and other unlikely marriages. The imagery is in the spirit of Boccaccio rather than the heavy morality of an Augustinian preacher. Taddeo's innovative use of light to convey miraculous revelation is exemplified in the *Annunciation to the Shepherds*, where natural light from a window is transformed into a divine light emitted by an angel and falling on the awakened shepherds.

An equally important commission in these earlier years was a collection of panels (now in the Accademia in Florence) devoted to the parallel lives of Christ and Saint Francis of Assisi. These panels were broken apart in 1810, and scholars have debated both their original configuration and their attribution. Taddeo is now the undisputed creator of the small quatrefoil images, probably dating from before the

frescoes in the Baron-celli Chapel; but their arrangement as part of a reliquary cabinet remains disputed. The saturated color of the sacristy panels in tempera, combined with the miraculous expressive light, represents an alternative to the monumental figures more typical of fresco as a medium and is an important element of Taddeo's powerful compositions.

In the period from Giotto's death (1337) until the onslaught of the black plague (1348), Taddeo and his shop had many commissions, although the evidence has been poorly preserved for the best-documented frescoes, done between 1341 and 1342 in the crypt of San Miniato al Monte in Florence. Taddeo's works for the Gambacorti family in Pisa and subsequently for the Strozzi in Florence do not survive, nor does the documenting letter itself, apparently the first written by an Italian artist to have been recorded.

Taddeo Gaddi (c. 1300-1366). *Tree of Life (Tree of the Cross)*. Side view. Santa Croce, Florence. Photo: © Scala/Art Resource, N.Y.

Following Meiss's groundbreaking study (1951) of the effect of the plague on the arts of central Italy, critics argued for a significant stylistic change among the new generation of artists, such as the Cione brothers, Andrea (known as Orcagna) and Nardo. For many critics, Taddeo's own reputation after 1348 is captured in *Il libro delle trecentonovelle* (c. 1390) of Franco Sacchetti. In the pertinent story, Orcagna asks a group of friends gathered at San Miniato al Monte to name the best painter after Giotto, but they cannot agree. Taddeo observes that art is in decline, a remark that stops the conversation until someone suggests that the cosmetics used by the women of Florence qualify them as the best artists. Taddeo's bleak view has, according to some scholars, obscured his own genuine accomplishment in coming to terms with the aesthetics of the new generation. Certainly, he continued to receive considerable commissions that allowed him to live comfortably in the Santa Croce quarter, as his tax records indicate.

The Florentines respected Taddeo's judgment, however somber, as is indicated by the fact that he served as an adviser to the Opera del Duomo (cathedral works) between 1355 and 1366. His presence, which is documented—and for which the documentation is augmented by accounts from Antonio Billi, the Anonimo Gaddiano, and Giorgio Vasari—led to the idea that Taddeo was also an architect and that in this capacity he finished Giotto's campanile, worked on Or San Michele, and created the model and design for the Ponte Vecchio after the flood of 1333. Architectural historians remain skeptical about this; but it is clear that in any case, as Ghiberti noted in *I commentarii*, Taddeo was very learned.

In 1348, Taddeo appeared on a list of painters who were being considered for the completion of Alesso di Andrea's unfinished polyptych of the Virgin and Child and Saints for San Giovanni Fuorcivitas in Pistoia. In 1353, he was paid for this work, portions of which remain in the church. On 3 April 1353, Taddeo returned ten florins and paid restitution for breaking his contract with the Commune of Florence by failing to paint the tribunal of the *mercanzia*, the high court of the merchants. That year he also signed a Virgin and Child for

Giovanni di Ser Segna for the church of San Lucchese, Poggibonsi (it was recorded as being there in seventeenth century but is now in the Uffizi in Florence).

In this last period Taddeo completed one of this most memorable fresco projects, for the refectory of Santa Croce. Vasari claimed that Giotto had created this fresco, but scholars now accept Taddeo as the artist. Although the date is still debated, it is increasingly thought to be c. 1360. This unusual composition includes the a Tree of Life, inspired by Saint Bonaventure's *Lignum vitae*, flanked by four pictorially framed scenes devoted to saints important to the Franciscan order. Beneath these paintings, spanning the entire width of the wall at the end of the refectory, Taddeo did a fresco of the Last Supper. He depicts a table that gives the illusion of projecting outward, at which sit Christ and the apostles, with Judas relegated to the side nearest the friars at their own tables in the refectory. This decidedly Franciscan iconography concluded Taddeo's long devotion to artistic projects for the priory and private quarters of the Franciscans in Florence, and it was one of the first of many depictions of the Last Supper in refectories of religious houses over the next two centuries. It also reflects Taddeo's lifelong commitment to—and success in handling—problems of pictorial illusionism.

In 1366, Taddeo Gaddi was recorded in the register of the Compagnia di San Luca, and that same year his wife was identified as a widow. Taddeo was buried, as Vasari notes, by his sons Angnolo and Giovanni at Santa Croce in the tomb he had made for his father, Gaddo.

Gaeta

Medieval Gaeta centered on the ancient castle that sits at the tip of the promontory at the southwestern corner of the Bay of Gaeta on the coast between Rome and Naples. The Normans rebuilt the castle, as well as the cathedral of Saint Erasmus, which contains some notable medieval artworks.

Gaeta remained under nominal Byzantine control after the Germanic invasions, and it did not succumb to the Lombards in the fifth century. The town coalesced around the castle in the mid-ninth century, when the bishop and civic officials sought its protective proximity after many Arab raids and finally the sack of the old town, Formia, across the bay. The Arabs' activities, however, also seem to have helped Gaeta establish its independence from the control of both Naples and the papacy. Their activities, and possibly even their outright support, may have helped Docibilis I replace the Neapolitan nominees, sometime before 867, as ruler of the town. His grandson Docibilis II was the first to claim the title *dux*. His family continued to rule until the coming of the Normans; after taking Capua as his princedom, Richard of Aversa seized the city in 1062. Thereafter, the duchy of Gaeta was part of the kingdom of Naples and Sicily, fought over by various claimants.

Gaeta had a role in Mediterranean commerce during the High Middle Ages. Compared with cities such as Genoa, Pisa, and Venice, Gaeta was only a second-rank commercial power. However, after Gaeta was incorporated into the Norman kingdom in the mid-twelfth century, the size of the city's fleet and its overall volume of commerce do not appear to have declined; in this regard Gaeta was unlike Amalfi. In the following centuries Gaetan ships carried Campanian olive oil, soap, and linen to places such as Sicily and also contracted to haul goods produced in other lands, such as Sicilian grain and cheese.

Gaiseric the Vandal

Gaiseric (Geisericus, r. 428-477, d. 25 January 477) succeeded his half-brother Gunderic as king of the Alans and Vandals. In May 429, Gaiseric transported his troops from southern Spain to Mauretania Tingitana (now Morocco). After several years of fighting, including an attack on the city of Hippo Regius, Gaiseric sought a peace treaty with the western emperor Valentinian III. Consequently, the Vandals became *foederati* and were permitted to settle around Hippo Regius. This was not enough to sate Gaiseric's ambitions in Africa; in 493, Gaiseric attacked Carthage, occupied the city, and declared his independence from Rome. After negotiations with Valentinian III in 442, the Vandals obtained proconsular Africa, Byzacena, and eastern Numidia. Gaiseric used his powerful fleet to control the western Mediterranean during his reign. In addition, he successfully defended himself against attacks from the eastern Roman empire in 431, 441, and 467. After his famous sack of Rome in June of 455, his troops occupied the city and plundered it for two weeks. Gaiseric was succeeded by his son Huneric.

Galla Placidia

Aelia Galla Placidia (Placidia, c. 388 or 390-27 November 450) was the daughter of Emperor Theodosius I (r. 379-395) and his second wife, Galla, and thus the half sister of emperors Honorius (r. 393-423) and Arcadius (r. 383-408). In the early 390s, Galla Placidia was granted her own household, which made her financially independent. In 394, she was summoned to Milan, and there she witnessed the death of her father in early 395. During her childhood she was called *nobilissima puella* ("most noble girl"). She seems to have been raised in the care of her cousin Serena, the wife of the western general Stilicho. She presumably received a classical education; she also knew how to weave and embroider.

When the Visigoths attacked Rome in 408, Galla Placidia remained in the city, where, for whatever reason, she concurred in the execution of Serena. By the time of the sack of Rome in 410, Galla Placidia seems already to have been in the hands of the Goths. She was carried off with them to Gaul, and in 412 she was married in a Roman ceremony to the Visigothic chieftain Athaulf at Narbonne. She may have been a factor in Athaulf's eventual pro-Roman outlook. She subsequently traveled with the Goths to Spain. She and Athaulf had a son, Theodosius, who died in infancy; his death precluded any opportunity for a rapprochement between the Romans and the Visigoths.

In 416, after Athaulf's death, Galla Placidia was finally restored to the Romans. In 417, rather against her will, she was married to the powerful Roman general Constantius; she and Constantius had two

children: Justa Grata Honoria and the future emperor Valentinian III. In 419, she and her husband became involved—on the losing side—in a controversy over the election of a new bishop of Rome. She personally summoned the African bishops to a synod in Italy, and three of the letters she wrote regarding this matter still survive. In 421, Constantius became coemperor in the west, and Galla Placidia was made *augusta* (empress); their elevation, however, was not recognized in the east. After Constantius's death, in the same year, she quarreled with her brother, and she and her children sought refuge in Constantinople with her nephew, the eastern emperor Theodosius II (r. 402-450).

After the defeat of the western usurper Johannes in 425, the eastern government belatedly recognized the claim of Galla Placidia's son Valentinian to the western throne, but only at the price of part of the western empire. Galla Placidia and Valentinian accompanied the eastern army to Italy, where Johannes was overthrown and Valentinian was proclaimed *augustus* of the west in 425.

Placidia served as Valentinian's regent for the first twelve years of the young emperor's reign. An early supporter of the new regime was the count of Africa, Boniface, who had not recognized Johannes. A rival for influence was Aetius, who had the support of the Huns. Galla Placidia's initial choice for supreme general was a certain Felix, who, however, was murdered in 430 on the orders of Aetius: according to one report, Galla Placidia had instructed Felix to kill Aetius. In Africa, Galla Placidia's erstwhile ally Boniface had meanwhile declared his independence, and after she sent an army against him, Boniface was said to have responded by inviting the Vandals to come to his assistance. The threat posed by the Vandals became so great, though, that a reconciliation between Boniface and Galla Placidia was reached. In 432, Boniface returned to Italy and defeated his rival, Aëtius, but was killed in the process. After a brief period of exile, Aëtius was restored to favor and became patrician and master of soldiers. The rise of Aëtius, coupled with Valentinian's eventual majority, had the effect of reducing Galla Placidia's direct authority, although she remained in a position of influence until her death.

Mausoleum of Galla Placidia, Ravenna. Photograph courtesy of Christopher Kleinhenz.

Galla Placidia was a devout Christian and a patroness of religion. She was involved in the building and restoration of several churches. In Rome she assisted in the restoration of the Basilica of Saint Paul Outside the Walls and contributed to embellishments of the church of Holy Cross in Jerusalem. In Ravenna, she built the churches of the Holy Cross and of Saint John the Divine. The latter was the result of a vow she had made in 423 when she and her children were caught in a storm on the Adriatic Sea: the dedicatory inscription reads: "Galla Placidia, along with her son Placidus Valentinian Augustus and her daughter Justa Grata Honoria Augusta, fulfilled their vow for their liberation from the danger of the sea." Placidia also favored the church of Ravenna in other ways, seeing to its elevation to the status of archbishopric. She also built a church of Saint Stephen at Rimini.

Galla Placidia died in Rome. Her burial place is unknown: there remains much doubt as to whether the so-called Mausoleum of Galla Placidia in Ravenna is actually her tomb. It is reasonably certain that either she or her son was responsible for its construction, but the building probably was initially intended as a chapel of Saint Laurence, not as a tomb. Galla Placidia exemplifies the strong-willed imperial women—Pulcheria, the sister of Theodosius II, is another example—who exercised great influence in the fifth century in default of effective male

leadership. For Placidia's extant correspondence, see Guenther (1895).

Galletto Pisano

Gallo (diminutive, Galletto; died c. 1301) is well documented in the 1270s and 1280s as an ambassador, city counselor (in Pisa), and *podestà* (in Volterra). He is also mentioned by Dante in *De vulgari eloquentia* (l.xiii.l) as having used the local language rather than the courtly vernacular, the *volgare illustre*, in his poems. Gallo is a good example of a Tuscan poet of the *Duecento* whose verses reflect the transition between the influence of courtly lyric motifs (advanced by Bonagiunta da Lucca) and Guittone d'Arezzo's studied formalism.

Gallo's two surviving *canzoni* are contained in three manuscripts: Laurenziano Redi 9, Vatican Latino 3793, and Florence B.N. Banco Rari 217 (II only). The first poem, *In alta donna*, is marked by mnemonic devices (strophic linkage through repetition, *coblas capfinidas*) and the courtly and uniquely Occitanized lexicon of the Sicilians (*amadori*, *leansa*). The second poem, *Credeam*, imitates the equivocal rhymes, labored forms, and metrical structure of Guittone's popular *Tuttor, s'eo veglio* and concludes with a rhyming play on Gallo's own name: *Di bella donna gallo,/ch'amo; ben dico Gallo*.

Galvano Flamma

Galvano Flamma (born c. 1283) came from a family of notaries in Milan. He joined the Dominican monastery of Saint Eustorgio at an early age. After a brief period in Pavia teaching theology, he returned to Milan, where he lectured on various subjects, including moral philosophy, ethics, and economics. Galvano is remembered chiefly as a

historian and a supporter of the Visconti family. His most important work, called *Chronica maior*, was a history of the Dominican order from its founding to c. 1344. Although it is no longer extant as such, much of it survives in his earlier *Chronica parva*. His many volumes dedicated to Milan contain invaluable information regarding the city's medieval history.

Garigliano, Battle of

Several strongholds in central Italy, established by Arab raiders in the ninth century, became concentration points for marauders (some Christian) who destabilized the area. Official attempts to evict these raiders failed, but a spontaneous resistance movement expelled the Arabs from the Roman area in the spring of 915. The Arabs retreated to their main base, at the mouth of the Garigliano River, which runs into the Gulf of Gaeta. There Pope John X gathered Roman and Spoletan forces, which were soon joined by troops from most of the southern Italian states. Gaeta's adherence to this unusual coalition of Italian powers, envisioned by Pope John VIII in the ninth century, was

achieved only with major territorial concessions. A Byzantine fleet under an able *strategos* proved crucial in isolating the Arabs from their reinforcements. After a two-month siege, an Arab sortie was annihilated in August 915.

Pope John X, who, like many tenth-century clerics, boasted of his fighting, gained prestige from the battle of Garigliano, as did Alberic of Spoleto (who was thus introduced into Roman society). The battle did indeed rid central Italy of Arab raiders (their focus moved northward); but it was the Byzantines who best exploited the victory, bringing most southern Italian states into allegiance with them soon afterward.

Gelasius, Pope

Gelasius I (saint, d. 29 November 496) became pope in 492, during a time of growing friction between east and west. Constantinople had been trying to move the center of secular and religious power eastward, away from the increasingly Germanic west. Furthermore, the eastern portion of the empire was troubled by the Monophysite controversy. Emperor Zeno (474–491) and his patriarch, Acacius, had tried to effect a religious compromise between Monophysites and Chalcedonians without consulting the papacy, which seemed distant in the Ostrogothic kingdom then ruling Rome. Gelasius's predecessor, Pope Felix III, had reacted to the escalating problems in the east by excommunicating Patriarch Acacius of Constantinople in 484. When Gelasius took office, he inherited the Acacian schism, which had to do as much with power as with orthodoxy.

These difficult issues made Gelasius's four-year papacy influential despite its brevity. Gelasius wrote more than 100 letters and tracts, including works against heretics—Pelagians and Manichaeans as well as Monophysites. However, he is best-known for his articulation of the primacy of Rome and his vision of the relationship between church and state. His theory of the political hierarchy grew out of his correspondence with Emperor Anastasius I (who had Monophysite inclinations). Gelasius argued that there were two powers by which the world was governed: the consecrated authority (*auctoritas*) of bishops and the power (*potestas*) of rulers. Of these, episcopal authority was the higher, since bishops were responsible for the spiritual well-being of their flock, and rulers were of that flock. Gelasius further claimed, in a famous formula, that the role of the emperor was to learn religion, not teach it. Finally, Gelasius asserted that of the bishops, the pope was preeminent as the "vicar of Christ," a phrase first used in Gelasius's papacy. Subsequent popes looked back to Gelasius's hierarchic theory as they worked to build the powerful medieval papacy.

Genoa

Genoa is a maritime amphitheater, formed rather like a Greek theater: the Apennines, branching from the Alps, dramatically frame the natural semicircular harbor. The city and its harbor are in the center of Liguria, one of the most picturesque regions of Italy. Rugged mountain passes isolated Genoa and its smaller coastal dependencies from the rich Po River valley of Lombardy to the north; this isolation impelled settlements toward the sea to become ports, and the sea was the source of their wealth and fame. The Bisagno and Polcevera valleys slice into Genoa on the east and west, only partially relieving the dense, restricted, vertical thrust from the harbor to the mountains above. Narrow coastal plains and harbor enclaves also interrupt the mountainous cascade into the sea. This rough terrain is punctuated by medieval family castles and religious sanctuaries that once divided the landscape into local fiefs (*feudi*) and were later overlaid by Renaissance and Baroque terraced villas, gardens, and farms, all facing the sea. The aristocratic residences towered over small fishing villages and maritime trading centers that, lacking sufficient agricultural production,

depended on imports from other parts of Italy and the Mediterranean to support the population. The result was a social, political, economic, and cultural emporium influenced by diverse elements from northern Europe and the Mediterranean.

Genoa always faced the sea. Its origins are shrouded from us, since the archaeological and literary evidence is fragmentary, but ancient Genua probably originated in the sixth century B.C. as a Ligurian settlement of warriors, fishermen, and shepherds, based on bronze age technology. In the first century after Christ, Strabo (*Geography*, 4, 6) mentioned "Genua, the emporium of the Ligures" as the center of the Ingauni and Intemelii tribes who settled the Ligurian coast. These coastal hill-town centers were already controlled by the Romans during the second Punic war against Hannibal in northern Italy c. 218 B.C. (Livy, *History of Rome*, 21, 32); they were connected to Rome and the republic (later the empire) by an extension of Via Aurelia up the west coast of Italy through Pisa and Genoa to Massilia and the western provinces. During the third Punic war (148 B.C.), Via Postumia linked Genoa inland to Lombardy and Emilia, piercing the mountain passes for military and commercial trade with the northern and northeastern provinces. This military-commercial network eventually became the basis for Genoa's role as strategic port of entry into northern Italy, with strong cultural ties to Lombardy. Genoa became a junction between sea and land.

Genoa's early development from a Ligurian fortified agrarian hill town to a Roman trading and entry port of secondary importance can be traced in the urban plan. In the southeastern part of the medieval city, above a small finger of land protecting the old harbor front (*ripa*), the twelfth-century church of Santa Maria di Castello stands at the center of the ovoid acropolis of the Ligurian *castrum*, which outlines the original system of streets and defensive walls. This inward-oriented fortress culture was opened up by the Roman grid plan of the *civitas*, a colony laid out to the north beneath the acropolis during the second century B.C., directly on the waterfront. Despite conquests and sacks by Lombards, Franks, and Saracens in the seventh and eighth centuries, the Ligurian *castrum* and Roman *civitas* were expanded by the linear-radial pattern of the medieval *burgus* and by trading suburbs (*faubourgs*) extending northward along the coast, from the tenth

century through the early fourteenth century. Lopez (1976) called this process the "commercial revolution" of the Middle Ages. These three divisions—*castrum*, *civitas*, and *burgus*—were united within the successive city walls of the eleventh, twelfth, and thirteenth centuries and were linked by arcades, streets, and marketplaces to the harbor and sea, which in effect became the *piazza* of the medieval city.

History and Municipal Institutions

Classical Genoa was a modest Roman provincial town situated at the head of the gulf of Liguria and on the great Via Julia Augusta, the coastal road connecting Italy and the western provinces. With the collapse of the empire in the western Mediterranean region in the fifth century, Genoa became part of the Ostrogothic kingdom. From 537 on, the Byzantines ruled the city and probably established its maritime tradition. The subsequent periods of Lombard rule (641 or 642-774) and Carolingian rule (774-ninth century) are the most obscure in Genoa's history. In 934-935, Muslim raiders from North Africa sacked Genoa. No local records survived this attack, and the city may have been abandoned for a few years.

A document from 958 reveals a refounded town eager to reassert

local laws and property rights. Local nobles, the bishop, and the townspeople struggled for power; and Genoa's theoretical overlords—the kings of Italy and the Obertenghi and Mala spina lords of Liguria—were usually occupied elsewhere. By 1016, Genoa had recovered its naval strength and joined with Pisa in attacking the Muslims on nearby Sardinia. A charter of 1056 reveals that the Genoese enjoyed a generous measure of self-rule, but the city's actual governing institutions remain unknown until the emergence of the medieval commune in 1099. In that year, the historian Caffaro informs us, a *compagna*, or sworn association of citizens, was established, and six consuls from the neighborhoods constituted its executive. Probably, a formal town government had existed throughout the late eleventh century. Genoa's extensive preparations for the large fleets that headed to the Holy Land to join the First Crusade in 1097 and 1100 explain the need to place the government on a sound footing when thousands of citizens would be absent. This crusade helped the Genoese gain valuable trading privileges and possessions in the newly established Latin states.

In the twelfth century, the Genoese continued to administer their city through a board of consuls, usually consisting of both nobles and prosperous merchants. The consuls' job was to foster Genoese trade overseas by securing commercial privileges and occasionally by fighting Pisa, which was Genoa's main rival during this period. Locally, the consuls extended the commune's authority over the nobles and over smaller towns such as Savona, Ventimiglia, and Portofino in Liguria. The consuls also presided over the system of taxes, which provided revenue needed to defend Genoa's interests; and over the judicial system, which was necessary to resolve commercial disputes and keep the peace among an increasingly unruly merchant elite, headed by the della Volta clan. By 1130, the city controlled the Ligurian coast from San Remo in the west to Portovenere in the east, as well as the mountain passes to the north. In 1133, the papacy raised Genoa to an archbishopric. By mid-century, the ambitions of Emperor Frederick I Barbarossa in Italy threatened Genoa's independence; the citizens therefore built the first great circle of walls around the city in 1158 and gained virtual independence from the empire in a charter of 1162. The rest of the century witnessed increased civil strife among clans, and wars with Pisa over supremacy in Corsica and Sardinia. In 1190—again

in conjunction with a naval effort overseas, this time the Third Crusade—the Genoese abolished the old commune and established a regime of a *podestà*, a professional city manager. The *podestà* was invariably a foreigner whose impartial rule was supposed to dampen local feuds and ensure justice.

Genoa settled down under rule by a *podestà* in the early thirteenth century, and the *podestà* also became responsible for commanding the city's land forces. Genoa's increasing prosperity from trade drew it into more intense rivalry with the Venetians in the eastern Mediterranean and the Catalans and Provençals in the west. In Italy, Genoa became involved in the wars between the Ghibellines, who supported Emperor Frederick II; and the Guelfs, who opposed him and were allies of the papacy. Genoa became a Guelf town because its own ambitions in southern Italy and its fears of Frederick's territorial aims in the north made it a natural ally of the popes; also, a Genoan, the canonist Sinibaldo Fieschi, became Pope Innocent IV in 1243. However, a Ghibelline party did exist in Genoa and in the subject towns of Liguria.

The death of Frederick II in 1250 brought victory to Genoa's side, but economic problems after the wars and inept leadership in a trade war with Venice in the east fostered a popular revolt in 1257. The *popolo*, middling merchants and master artisans who had been largely excluded from political life, established a regime under Guglielmo Boccanegra, who ruled as captain of the people until 1262. His regime pursued policies favored by the *popolo*, established advantageous ties with the Byzantines, reformed the public debt and taxes, and began building a secular administrative center, the present Palazzo San Giorgio. When Guglielmo Boccanegra was overthrown by the nobles and some of the *popolo*, Genoa reverted, uneasily, to rule by a *podesta*. Genoa opposed domination by Charles of Anjou and the Guelfs in Italy, largely because domination by the French to the west of Liguria and in Naples and Sicily threatened its security and trade. Also, continued trouble with Pisa over Sardinia provoked war. These external challenges caused a change in government in 1270, when the nobles Oberto Spinola and Oberto Doria, representing the leading Ghibelline families, became captains of the people and de facto rulers of Genoa. A Guelf party, under the Grimaldi and Fieschi families, remained in the city, but the opponents of the Angevins dominated the city until 1317. These years

witnessed famous victories over Genoa's rivals: the Pisans were crushed at Meloria in 1284, and the Venetians at Curzola in 1298. Pisa never again threatened Genoa, but Venice was still a powerful rival.

Continued rivalry between Guelfs and Ghibelline nobles, in which the restive *popolo* usually sided with the latter, produced periods of anarchy in 1296 and disorders that continued into the fourteenth century. The political leaders tried to cure domestic ills by submitting to foreign rule in 1311, handing the city and its possessions over to Emperor Henry VII. This experiment ended with Henry's death in 1313. From 1314 to 1331, the city was nominally Guelf, but it experienced a protracted and costly civil war that damaged both overseas commerce and the Ligurian countryside. From 1318 to 1335, another invited foreigner, Robert, king of Naples, ruled the Guelf capital. In 1331, the weary Genoese ended the civil war, allowed Robert to remain the nominal ruler, divided governmental offices equally between Guelfs and Ghibellines, and consolidated the huge debts of both sides into a great new funded debt. In 1335, civil strife resurfaced, Robert of Naples resigned, and two noble captains ruled the city. In 1339, the Ghibelline *popolo* rose against the nobles, and Simon (Simone) Boccanegra, a grandnephew of Guglielmo, became doge for life. This new system of government, partly inspired by the Venetian model, established a strong executive doge who presided over a bureaucracy and advisory bodies and was expected to serve for life. The regime favored the merchants and people, and it set about reducing the crushing burden of debt, pacifying Liguria, and fostering trade. Although a revolt turned Simon Boccanegra out in 1344, he was replaced by another doge and returned to office himself in 1356. From 1339 to 1528, Genoa alternated between self-rule under its "perpetual" doges (the term is a misnomer, since the doges were almost invariably overthrown), short-lived republics, and foreign rule.

The plague of 1348 devastated Genoa and greatly reduced its military forces, which were never again able to defeat Venice. After a disastrous defeat at Chioggia in 1380, Genoa became a second-rate naval power. Continued civil strife and incompetent rule—largely under Antoniotto Adorno, who was elected doge for life four times between 1378 and 1394—led Genoa to submit itself again to foreign rule, this time under Charles VI of France, from 1396 to 1409. Such periods of external rule

seldom brought peace to Genoa, because its local institutions continued to function poorly and a royal governor substituted for the weak doge. The phase of French rule in 1396-1409 did supply one effective governor, Jean Le Meingre, marshal of France, called Boucicaut, who ruled sternly for eight years. His lasting accomplishments were a new, comprehensive code of law and the founding in 1406 of Casa San Giorgio. This institution, originally intended to consolidate Genoa's vast public debt, became in the course of the fifteenth century the city's most important body, as it controlled public credit and functioned as a state bank and the chief tax collector. Machiavelli called Casa San Giorgio "the state within the state" because of its extensive political and economic powers.

In 1409, a revolt ended French rule; and during much of the fifteenth century and into the sixteenth there was a bewildering series of revolts and dogeships by the rival Fregoso and Adorno families. Again Genoa resorted to long periods of foreign rule, now by the dukes of Milan (1421-1435, 1464-1478, 1487-1499) and the kings of France (1458–1461, 1499–1507). Genoa's own interests were subordinated to the ambitions of the Milanese or the French, and Genoa increasingly became a pawn in the rivalry between France and Spain for control over Italy. After a disastrous sack in 1522 by Spanish forces, and the defeat of the French in 1525, Andrea Doria's coup of 1528 established Genoa as an aristocratic client state of Spain.

Economic Life

Genoa and its region, Liguria, include approximately 200 miles (331 kilometers) of coast from just west of Ventimiglia to around Portovenere. The medieval city also eventually controlled the mountainous region that circumscribes this rocky coast, and part of the hilly land to the north, on the fringe of the Po Valley. Genoa's economy, however, did not thrive on local agriculture, because Liguria has little flat land and few areas of good soil. Having almost no minerals and few natural resources other than beech and chestnut forests, the hardy Genoese people turned to the sea. But no sizable rivers enter the sea along Genoa's stretch of coast, and the fishing was poor because the

seabed dropped quickly, producing deep and relatively barren waters. Genoa's main natural advantage was its good harbor, the northernmost harbor along this coast. The harbor, and the shorter but still arduous passes through the mountains, made Genoa the port of the upper Po Valley.

The earliest phase of the medieval Genoese economy, known to us mostly as it existed in the tenth and eleventh centuries, marked the first efforts to establish maritime trade. Local agriculture produced wine, olive oil, and other bulky commodities that were moved more easily by sea than by land, and the local forests yielded a good mix of timber for building ships. This early trading phase probably involved short trips in small galleys that hugged the coast; these vessels also brought back grain, salt, and cloth to the refounded small town. Genoa also faced rivals— the Muslims, who were still a naval power in the western Mediterranean during the early eleventh century; and the nearby Pisans, who were interested in the same markets and commodities as the Genoese. Local merchants probably doubled as pirates, and the origins of Genoese capitalism have often been associated with combative, lucrative preying on Muslim shipping. By the mid-eleventh century, however, the Genoese were trading with the Muslims in Sicily, Spain, North Africa, and Egypt, so retaliatory piracy would have been risky to Genoese merchants trading peacefully overseas.

By the First Crusade (1100), Genoa was one of the main sea powers in the Mediterranean, and its merchant galleys, always armed and carrying a crew of about 120 men, were its main economic resource. A burst of information now becomes available from legal documents and especially from a precious source—the notarial cartulary of Giovanni Scriba and its hundreds of commercial documents from the years 1154 to 1164. These documents reveal a sophisticated economy. Overseas trade, Genoa's economic backbone, relied on three types of contracts:

the *commenda*, the *societas*, and the sea loan. In a *commenda* contract, a traveling partner took an investor's capital on an overseas trading venture; on that partner's safe return, the investor received back the capital and three-quarters of the profit while the traveling partner received one-quarter. A *societas*, or bilateral *commenda*, required both partners to contribute capital, typically two-thirds from the investor and one-third from the traveling partner, who received half the profit for his efforts. In a sea loan, a merchant borrowed a sum from a creditor, who received back the capital and a premium on the safe return of the borrower. These contracts involved various degrees of risk and reward but in general enabled retired merchants to live by wise investments and gave young men with little or no capital a chance to begin a trading career. Disputes over contracts were resolved by a sophisticated body of merchant law and a system of arbiters, and the commune protected its merchants by securing privileged trade through treaties.

Giovanni Scriba's cartulary reveals that Genoese trade centered on the eastern Mediterranean. Trade with Egypt and Latin Syria was the most lucrative and involved the fabled eastern luxuries—spices like pepper and cinnamon from distant east Asia, and local products like silk, cotton, sugar, and gold. The Byzantine empire was a secondary but important supplier of similar luxury goods. In the central Mediterranean, trade with the islands, mainly Sicily, predominated. In the west, Genoa's trade focused on North Africa and its gold. The slave trade was already well established, and slaves were procured everywhere, but in this period they were especially Muslims. In the late twelfth century, the Genoese exported luxury goods over the mountains to the upper Po Valley and the fairs of Champagne, where the goods were sold or exchanged for woolen cloth and silver, at a vast profit. Genoa had several advantages in this trade. Its fast galleys were ideally suited for transporting lightweight, valuable products, and it controlled access to two valuable markets—Lombardy and northeastern France. Its potential rivals in the west, Marseilles and Barcelona, were not yet in a position to challenge it; and although its Italian rivals, Pisa and Venice, competed in the east, they had their own local markets.

Genoa thrived as a nexus between the eastern Mediterranean and northwestern Europe. It needed commercial privileges in Latin Syria

and obtained these by aiding the crusades; it also needed treaties with the Byzantines, who still controlled access to the Black Sea. Trade with Egypt was the prize, but there the Genoese found established markets and highly skilled traders who dominated the spice trade. Elsewhere, commerce with Sicily involved the Genoese in disputes between the Norman kings and the German emperors. Genoese artisans supplied good ships and the sails, oars, barrels, biscuits, armor, rope, and other products that sustained the fleets. Genoa was not a manufacturing town, except for ships and some local services. It produced no valuable trade goods other than gold thread made by its skilled women, and so it depended on things made elsewhere, to be shipped wherever they yielded a profit. The galleys employed thousands of free rowers and gave both nobles and self-made men a chance to make—or lose—a fortune at sea. Women had property rights, secured in law, that allowed them to invest in commerce, and thousands of women labored in the maritime artisan trades.

Early in 1252, Genoa introduced the first regular gold coinage in the west, narrowly edging out Florence. By then Genoa dominated trade in the Greek lands and rivaled Pisa and Venice in the crusader states, and Egypt remained the heart of the eastern trade. During years of expensive warfare Genoa had been on the winning side, that of the Guelfs; and soon the city again opened trade with Sicily and southern Italy. In the west, the Catalans and Provençals were now its trading rivals, and its struggles with Pisa over supremacy in Sardinia and Corsica were reaching a climax. By the 1270s, regular galley service from Genoa to Bruges began to open up markets in England, northern France, and the Low Countries. Genoa's galleys, unlike those of Venice, remained completely private ventures. Because of vast war debts, the popular regime under Guglielmo Boccanegra had to reorganize the commune's finances, which relied heavily on excise taxes, a modest tariff, and borrowing during wartime. Revenues had been routinely mortgaged years in advance, and the common people paid most of the taxes. In 1259, Guglielmo restructured the public debt into a great *compera*, or fund, divided into 100-*lire* shares that paid 8 percent interest. A precocious market in public securities developed as new laws allowed creditors to sell shares. Public finance, needed for wars against the Pisans and Venetians, increasingly consumed Genoese

capital, but these investments were not as lucrative as overseas trade, which by the 1290s had reached nearly 3 million *lire* a year.

The civil wars of the early fourteenth century devastated Genoa's trade as rival fleets fought and created new debts. The revolution of 1339 destroyed the records of public debt and the customs house. The new doge honored the old debts, whose interest was paid from excise taxes dedicated to specific debts. In the east, Genoa's largely self-governing possessions, principally Pera near Constantinople and Caffa in the Crimea, were vital to trade, now that Latin Syria was lost and trade with Mamluk Egypt became more problematic. A privately funded fleet in the eastern Mediterranean seized the island of Chios and the alum mines at nearby Phocaea in 1346. The government, which was too poor to reimburse the participants in this venture, agreed in 1347 to recognize the shipowners as a company, the Mahona of Chios, which received the right to administer and profit from the island for twenty years; after that time, the state had the option to buy out the shares in the Mahona. Genoa never had the money to buy the shares, and a series of deals with the Mahona and its successor represent an early experiment in colonizing and exploiting a region through a private company. The experiment benefited some Genoese investors but burdened taxpayers with the island's defense.

The Genoese economy, weakened by war and debt, suffered in the aftermath of the plague of 1348. The city's population fell from perhaps 70,000 to 40,000; and its labor-intensive shipping paid the price. A switch from galleys to the cog, a laborsaving great sailing ship, helped preserve Genoa's trade. Cogs carried eastern luxuries to Europe, which now had more capital per person and an appetite for finer things. The customs records of 1376 show that trade had recovered considerably, amounting to nearly 2 million *lire*. Imports from Flanders (mainly cloth) and Egypt still constituted the bulk of trade. Genoa's industrial base remained weak, and its niche in the European economy seemed increasingly fragile and contested.

Disputes with Venice over control of the eastern trade led to defeats, and to new debt and taxes. The period of French rule from 1396 to 1409 witnessed the rise of the city's famous financial institution, Casa San Giorgio. This *compera*, another restructuring of the public debt, absorbed nearly 3 million *lire* of debt to pay the shareholders 7 percent,

instead of the higher return promised during wartime. Casa San Giorgio acquired all the taxes pledged to make the interest payments, thus becoming a separate arm of the state, run by the creditors. Its shares became the foundation of the Genoese securities market. In 1408, Casa San Giorgio began a banking business, lending money to its shareholders and providing services such as bills of exchange. By 1437, the bank also managed the mint. Continued state borrowing and undercapitalization brought the bank down in 1444, but Casa San Giorgio continued to function until 1807. It was one of the most durable financial institutions in European history and was worthy of Machiavelli's respect.

Genoa's trade slumped between the 1420s and the 1490s as the Venetians dominated Mediterranean commerce. Genoa now competed with Spain, Portugal, England, and France as well. The advance of the Ottomans also hurt Genoa, which lost its eastern possessions, notably Pera (1453) and Caffa (1475); only Chios remained Genoese, until 1566. During the fifteenth century, Genoa became an increasingly industrial town, engaged in some old manufacturing businesses such as wool and in relatively new ones such as silk, cotton, and paper. These new industries, especially silk, employed many people and brought some prosperity to Genoa. Genoa had only a small market in Liguria; therefore, success in manufactures required active overseas commerce, at a time when its fleets were dwindling in size.

The Genoese economy rebounded in the 1490s, only to suffer again in the early sixteenth century as wars and the sack of 1522 destroyed its resources. During this period, the state was a pensioner of Casa San Giorgio, which collected all its revenues and paid out the lion's share to the creditors. By 1509, the debt had reached 20 million *lire*, a considerable sum. Under the guidance of Andrea Doria, Genoa assumed the status of a loyal junior client state of Spain; as a result, it shared in Spain's prosperity during the early and middle sixteenth century. But Genoa served Spain primarily as a banker, not as a trading center, and much of its new prosperity vanished during the Spanish bankruptcies later in the sixteenth century.

Art and Architecture

After visiting Genoa in 1352, Petrarch (*Le familiari*, 14.5, 23– 25) wrote an important early humanist encomium to city life. He stressed Genoa's close relationship to nature and described the landscape in an idealized Virgilian pastoral-arcadian mode:

[Genoa] seemed to me not an earthly place, but a celestial abode which the poets place in the Elysian Fields, as the peaks of the hills [rise] with their amenable paths [above] the fertile little valleys and in these valleys [live] happy people. Who would not have gazed with amazement from high [on the surrounding hills] at the towers and palaces, nature vanquished by man, the rough hills covered by citrons, vineyards, and olive groves, the buildings of marble at the foot of the hills, second to no one in royalty and enviable to any city?

The art and architecture of medieval Genoa had a major role in this idealized classical image of the city, reminiscent of the golden age. It was, to quote Henri Pirenne, a rebirth of Mediterranean trading cities, in a symbiotic relationship with its natural harbor, a maritime theater of art representing the particular interests of business, family, religious, and communal patrons. Three themes are central to Genoese medieval art and architecture: appropriation, spoliation, and transformation.

From its Lombard background and its ascent in the Mediterranean, Genoa appropriated diverse cultures, representing its feudal and commercial development; and spoliation became a defining element of its artistic landscape and its historical narrative. From the First Crusade of 1097-1104 through the Fourth Crusade and the Latin occupation of Constantinople in 1204-1262, Genoa competed fiercely with Pisa and Venice for the despoliation of Byzantine and Muslim sacred sites, the "translation" of Mediterranean power to the west. This process transformed Genoa (as it transformed Pisa and Venice) "from a city of austere stone and wood to one of marble," to paraphrase Suetonius on Augustan Rome.

French, Lombard, Byzantine, and Islamic influences merged in the cathedral of San Lorenzo, the major civic-ecclesiastical commission of the medieval period. The cathedral was rebuilt from the early twelfth century through the early sixteenth; and its Lombard Romanesque, Gothic, and early Renaissance styles embodied its cultural ties to northern Italy. In particular, the cathedral reflects Genoa's links to

Milan, to the stone quarries of Lake Como, and to the Certosa di Pavia—from which Lombard stonemasons, sculptors, painters, and master builders came to Genoa. These artists and artisans eventually dominated the local culture, forming their own guilds of *maestri antelami* (analogous to the less prominent *arti genovesi*) and supervising and strongly influencing the cathedral works and other Ligurian commissions. The black and white marble that decorated the cathedral—and highlighted the massive religious center above the dense medieval port—was quarried in Promontorio (Val Polcevera) and Carrara; it is an example of this Lombard-Comasque tradition.

Petrarch and other travelers praised the distinctive black-and-white marble facades of the Genoese palaces and churches. Towering over the harbor enclosure, this urban scenography rivaled Venice's sumptuous palaces and churches: classical spoils defining public spaces in a Byzantine orientation. In contrast to San Marco in Venice, with its luminous Byzantine baldachin style and the theatrical sequence of triumphal arches forming its entry, Genoa's San Lorenzo faces west. San Lorenzo is a Lombard Romanesque-Gothic longitudinal church of northern Italy, competing in size and grandeur with other Italian and European cities and trumpeting Genoa's rise to an archbishopric in 1123; it was a proper place for sacred relics stolen by crusaders—relics that became the ceremonial focus of communal development.

Within the high Romanesque black-and-white nave sanctuary, gold and silver chalices, censers, emerald plates, ivory figurines, jewel-studded crosses, precious reliquaries, and sumptuous vestments and fabrics—of Byzantine, Muslim, and Asian origin—served as liturgical implements and even as objects of worship: these treasures were both the booty of the Mediterranean conquest and signs of divine favor. Miracle-working icons, such as the Volto Santo, the cloisonné image of Veronica's veil of Christ, framed in gold relief and housed in the Convent of San Bartolomeo degli Armeni, were examples of Byzantine "sacred art" for Genoese and Lombard artists. They also became sacred objects in communal pageants and processions during feast days, crises, and victories, as described in Caffaro's annals.

Within San Lorenzo, the relics of Saint John the Baptist, taken by crusaders from Mira in 1097, gave Genoa an additional new patron saint, of water, rivaling Florence. John the Baptist joined Saint

Lawrence (a remnant of Genoa's early ties to Rome and Ambrosian Milan), the Virgin Mary, and the bellicose Saint George as a spiritual protector of and an intercessor for this unruly crusading port. Carved and painted images of the patron saints, in particular Saint George, appeared throughout Genoa in lively Byzantine, Lombard, and international Gothic styles over portals and within chapels, presumably sanctifying the alliance of church, family, and commune with military crusades and commerce in the east. The saints were ubiquitous in urban life. Even today, the relics of John the Baptist, in their late Gothic reliquary, are taken from their chapel in the cathedral on the feast day of his nativity (24 June) and carried by the archbishop and the communal government to the harbor front for a mass and a ceremonial blessing of the sea, Genoa's version of Venice's *sposalizio al mare*. Art and architecture shaped the public and private life of medieval Genoa.

As one approaches the triumphal entrance facade of San Lorenzo, with its deeply splayed portals and spiral colonnette clusters from the early thirteenth century, one sees the first example of the French Gothic style in Italy. However, the facade is also studded with colored glass, stones, and decorative patterns, characteristic of Byzantine and Muslim Mediterranean influences. Genoa's *spolia*—Roman and Byzantine—including columns and sculptural reliefs, were mounted on the facades of the church and within the sanctuary, to celebrate the city's ancient foundations and its competition with Venice for dominance in the Mediterranean. This "sacred city" was announced on the central portal by flanking rampant lions and by the Tree of Jesse and pilaster reliefs of the incarnation, which support the solemn tympanum figure of Christ and a Last Judgment above a Martyrdom of Saint Lawrence. All this prefigures the salvation represented by the high altar; artistically, it reflects diverse stylistic influences and religious-political ties, from the Tree of Life on the medieval papal church of Orvieto to the Last Judgment tympanum reliefs of the lie de France, Chartres, and Notre Dame.

Under a communal regulation, black-and-white marble facades were reserved for major churches, such as the cathedral and the late thirteenth-century mendicant churches of San Francesco di Castelletto and San Domenico (both destroyed during urban expansion in the 1860s); and for the rival old noble families, such as the Fieschi and

Grimaldi (who were Guelfs) and the Doria and Spinola (who were Ghibellines). These families rebuilt their urban neighborhoods (*alberghi*) and country retreats (*ifeudi*) during the thirteenth and fourteenth centuries, a period of conflict for control of the weak communal government and the unstable coastal regions. In Genoa, as in Venice, displays of marble, *spolia*, and commemorative inscriptions became a distinctive element of power—ecclesiastical, civic, and noble. Through such displays, the Genoese celebrated their crusades and their naval victories over Pisa and Venice.

The short-lived government of Guglielmo Boccanegra built the first communal palace (later Palazzo San Giorgio) in 1260, thirty years before the communal palace and *piazza* of Florence. Genoa's communal palace was erected directly on the harbor front, the *piazza* of the medieval city. Designed by the cleric-architect Frate Oliverio, who is identified by inscription and date on the entrance portal, the Lombard-Gothic block form set the style for Genoese palaces, inspired by the communal palaces of northern Italy (e.g., Como). Crenellations with the cross of Saint George, Gothic arcades, and hard stone and brick facades with black-and-white marble fenestration defined the polychrome style of the communal government in competition with noble patrons. According to a contemporary continuator of Caffaro, the Byzantine emperor Michael Paleologus gave the Genoese a "large and ample palace" in Constantinople "in the form of a castle that the *Veneti* occupied in that city," in gratitude for their support against Venice in lifting the Latin occupation in 1262; and "the Genoese, amid the clamor of trumpets, bugles and horns, tore down that palace to the foundations, and they transported certain stones to Genoa in their ships, of which several were placed in the *casa del Comune* built on the harbor front." Art and architecture, through ceremony, blended with military and church history in creating new civic narratives.

The Boccanegra palace was converted to the *dogana* (customs house) in 1291 and to the Banco di San Giorgio in 1407, during the French reforms of Jean Le Meingre, marechal de Boucicaut. In 1290, during the period of feudal conflict among the old nobles, a new Palazzo Ducale was constructed inland, amid the narrow protected streets near the cathedral of San Lorenzo; it is in a rusticated fortress style with a campanile and is contemporary with other communal town halls in

central Italy. The Palazzo Ducale and the family *alberghi* neighborhoods of Genoa became the locus of patronage for the so-called perpetual doges and the foreign rulers, and for the old noble families, who controlled the city through their military, economic, and political power. Entire districts, such as the thirteenth-century church and neighborhood of the Doria family at Piazza San Matteo, preserve the private character of medieval art and architecture in Genoa. That art and architecture anticipated the comprehensive, balanced, symmetrical Renaissance urban planning of Leon Battista Alberti, a Florentine who had been born and raised in Genoa.

Geography and Cartography

The legacy of geographical knowledge from the classical world was accepted only selectively in the Middle Ages, as the needs of Christian societies warranted. These needs were related to the cosmographical and historical teachings of the newly established church, the finding of pilgrimage routes, local land and water management, the crusades, and mercantile navigation in the Mediterranean and Black seas. Such knowledge was usually gathered and used on a specific local and timely basis, with no need for complex mathematical structures, such as global coordinate systems, in which to compile the information. Broadly speaking, textual media for the representation of geographical facts and ideas were deemed sufficient and were commonly joined by graphic representations only later in the Middle Ages, as the subject matter became more complex.

Scholars in the Italian peninsula generally took an active part in these geographical activities, sometimes assuming an undisputed position of leadership, as with the development of Mediterranean sea charts in the thirteenth and fourteenth centuries. In other types of geographical scholarship at other times, such as the compilation of encyclopedic geography and theoretical cosmography during the early Middle Ages, Spain and northern Europe were in the vanguard.

Pilgrimages and Itineraries

The *itineraria picta* or *scripta*, illustrated (either as maps or with paintings—the interpretation varies) or written itineraries, were an important legacy of the Roman empire. Examples of written itineraries from the late Roman empire include the Antonine itinerary (late third century) and the Bordeaux itinerary (surviving as a ninth-century manuscript based on a fourth-century archetype). The oral or written (rather than drawn) itinerary became the primary means of communicating directions in the early Middle Ages. It was adapted to describe pilgrimage routes after Christianity became officially recognized. Such itineraries have also been shown to have been used as sources of place-names for later geographical compilations or world maps. *Tabula Peutingeriana*, originally of the mid-fourth century (but perhaps relying on first- or second-century sources for some sections),

survives in an eleventh- or twelfth-century manuscript on vellum in eleven sheets designed to be fitted together to form a map 21 feet long and 1 foot wide (about 6 meters by 33 centimeters). It, or something very like it, was also used as a source for the early cosmographies, particularly the one known as the *Ravenna Cosmography*.

Books of sailing directions, or *itineraria maritima*, were the seaman's version of the land itineraries and were used for navigating in the Mediterranean. The classical Roman and Greek versions (the latter were called *periploi*) had parallels in the Middle Ages (for example, *Lo compasso da navigare*, thirteenth century) and must have provided at least some of the data for the portolan charts beginning in the thirteenth century.

Worldview: Encyclopedias, Cosmographies, and World Maps

The worldviews adopted for cosmographical purposes were thus simple, diagrammatic, and schematic. They followed basically two types of schema: the zonal climata stemming from Aristotle's *De caelo*, consisting of frigid, temperate, and torrid latitudinal zones; and the tripartite world—traceable back to Sallust's *De bello Jugurthino*—in which the world was divided among the three primary continents: Asia, Africa, and Europe. When it was adapted to Christian cosmography, this system developed into the familiar T-in-O maps, representing the world as divided among Noah's descendants.

Geographical encyclopedias and cosmographies of the patristic period were more likely to follow Pliny, Pomponius Mela, Solinus, iMartianus Capella, Macrobius, and Orosius rather than the *Geography* of Claudius Ptolemy and the Greek tradition. Early examples include the *Cosmographia* of Julius Honorius (c. a.d. 376), an erratic compilation of settlements, tribes, and rivers, all under the rubric "towns." In the beginning of the sixth century there appeared a tract by Julius Aethicus containing a detailed account of the tradition of Julius Caesar's measurement of the earth; the rest of the "cosmography" is practically identical with Honorius's work. Aethicus writes as a patriotic Italian, emphasizing the glories of Rome; his work, like that of

Honorius, is, however, made up largely of lists of place-names.

This tract of Julius Aethicus is often confused with a very different and probably later treatise, the cosmography of Aethicus of Istria (perhaps from the seventh century at the earliest). Aethicus of Istria's work appears as a narrative of an "exploration" by him translated from the Greek by a priest masquerading as Jerome (a favorite traditional authority of geographical thinking). It is one of the longest and liveliest early Christian geographical documents and was quoted by much later writers, including Roger Bacon and even Walter Raleigh. The author was clearly a copyist of bishop Isidore of Seville (c. 560–636) and of other encyclopedists.

In the early eighth century in Ravenna, then the Italian center of the Byzantine world, a cleric now known as the Ravennate ("Ravenna geographer") compiled an elaborate description of the world from varied sources, including Ptolemy, Orosius, Isidore, and possibly something like *Tabula Peutingeriana*, in addition to a number of otherwise unknown Greek, Roman, and Gothic works. The main importance of this *Ravenna Cosmography* is that it demonstrates the breadth of written and graphic geographical sources available at the time. In several passages, the author is apparently referring to a map, or even constructing one to go along with the text. The general structure of the work seems to follow twelve radiating zones, broadly conforming to the position of the sun during the day and night, and it is possible that a map following this "sundial" pattern was also compiled, as several authors have reconstructed. The *Ravenna Cosmography* seems to have been the major source for an encyclopedia by a certain Guido of Pisa in a twelfth-century manuscript, which also contains a world map and a sectional map of Italy.

In Italy, unlike in the rest of Europe, there appear to be few references to large mural world maps made for clerical or secular purposes before the fourteenth century, and we assume that the paucity of the record is not deceiving us. The map known as the Vercelli world map, now dated to the late thirteenth century, was probably not made in Italy, although its link to the English geographical culture of the thirteenth century has also been cast into doubt. There are, however, written references to public mural maps in the fourteenth century that have since been destroyed: In Siena, Ambrogio Lorenzetti painted a

large rotating planisphere in 1344 for the Palazzo Pubblico; in Venice, a *map-pamundi* decorated the public loggia at the Rialto market in the fourteenth century and wall maps of the world were made for the ducal audience chamber under Doge Francesco Dandolo (1329-1339).

Cosmographies and geographical works from the twelfth, thirteenth, and fourteenth centuries include Godfrey of Viterbo's topographical poem *Denumeratio regnorum imperio sub- jectorum* (mid-twelfth century), Ristoro d'Arezzo's *La composi- zione del mondo* (1282), Riccobaldo da Ferrara's *De origine urbium Italic et ipsius Italic prirno incolatu* and *De locis orbis et insularum et marium*, and the anonymous *Mirabilia urbis Romae*, a booklet on the topography and monuments of Rome,

The importance of Ristoro d'Arezzo's *La composizione del mondo* derives from its identification of some basic processes in physical geography and geology, such as erosion, deposition, and earthquakes, as well as a recognition of the varying resistance to erosion among shales, clays, sandstones, and conglomerates of the gullied landscapes of the Tuscan Apennines. Many of these natural phenomena had been recognized by classical authors, particularly Pliny in *Historia naturalis*.

The extraordinary *cartes moralisées* by the Pavian cleric Opi-cino de Canistris (1330s) are in a category by themselves. In a sort of spiritual diary, Opicino appended several maps that are based on the accurate outlines of the Mediterranean in portolan charts of the time, but he stylized the coastal shapes into profiles of figures in a kind of geographical graphic pun, to comment on spiritual and political issues.

Geography at the Courts of Roger II and Frederick II

Although their influence on the geographical activities of the court of Roger II of Sicily (1097-1154) was not felt in Christian Europe until they were translated from Arabic, the maps and books of al-Sharif al-Idrisi deserve mention here. Idrisi was born in Ceuta, Morocco, in 1100 and was invited to Roger's court in Palermo c. 1138. Idrisi had rich experience in North Africa and western Europe, and Roger asked him to compile a world map engraved on silver and a geographical compendium, *Nuzhat al-mushtaq* (the *Book of Roger*), containing a

small circular world map and seventy sectional maps (ten maps for each of the seven climatic zones). Although the silver map, which was probably intended as some form of master, is no longer extant, the contents of the book survive in at least six fourteenth-century manuscripts and several more dated later.

Frederick II (1194-1250), grandson of Roger II, inherited Roger's interest in scholarship and developed a penchant for natural history. He invited Michael Scot (d. 1236), who had studied in Spain, to become his court astrologer, to whom he posed questions on physical geography, particularly on volcanic activity and the hydrological cycle.

Italian Geographical Interest in Asia in the Thirteenth and Fourteenth Centuries

The series of attacks by the Mongols on eastern Europe in the first half of the thirteenth century prompted a series of diplomatic, missionary, and mercantile expeditions. The reports of these travels provided varying amounts of valuable geographical information, and the efforts by Italians were in the vanguard. Following the Council of Lyon in 1245, two diplomatic missions to the east were organized. One of them, the pioneering expedition of Giovanni de Piano de Carpine, a Franciscan of a house near Perugia, succeeded in reaching the Mongol capital of Karakorum (1245-1247). Giovanni de Piano gives a clear description of the customs of the Mongols, but the geographical and topographical value of his work is overshadowed by the accounts of his successors, William of Rubruck (whose account found its way into the *Opus maius* of Roger Bacon), Niccolo Maffei, and Marco Polo (1298). The impact of the amazing geographical information in Marco Polo's *Book of Marvels* was curiously delayed: the *Catalan Atlas* of the later fourteenth century and Fra Mauro's map of c. 1459 stand out as two of the very few cartographic expressions of his narratives before the printed editions in the Renaissance had their full effect. Other travelers included John of Monte Corvino, a Franciscan (c. 1247-1328) whose strictly religious mission, dispatched in 1278, provided valuable accounts of India and China; Odorico da Pordenone (c. 1265—1331), whose journal *Descriptio Orientalium Partium* was dictated in 1330 in

Udine; and Johannes Marignola (Marignolli), a member of the Santa Croce monastery in Florence, whose travel notes in his *Cronica Boemorum* (*Annals of Bohemia*) provided a detailed account of the rivers of paradise and an identification of Sri Lanka with the site of the garden of Eden.

Crusades

Land routes were used in the First Crusade (1096-1099), but the value of maritime routes was learned during the Second Crusade, and Venice above all was in an attractive position to benefit from the carrying trade. The geographical and mercantile basis of the crusades was expressed most articulately by Marino Sanuto the Elder, of Torcello, whose *Liber secretorum fidelium Cruris super Terrae Sanctae*, begun in 1306 and presented to Pope John XXII in September 1321, laid out, in text and maps, how Christian Europe could obtain the exotic goods it needed without trading with Egypt. The plan relied on a conquest of Egypt, full use of the northern trade routes through Persia, and the establishment of Christian hegemony in the Indian Ocean. Along with the text, four detailed maps of the world, the eastern Mediterranean, Egypt, and the Holy Land compiled by Pietro Vesconte were included.

Among the members of the commission chosen by John XXII to examine the *Liber secretorum* was Paolino Minorita (Fra Paolino Veneto), whose own geographical writings stressed the importance of using both written and graphic evidence. Paraphrasing his *De mapa mundi*: "Without a world map, it is impossible for the mind to grasp what is said about nations and regions in divine and human writings." His own manuscripts include a world map, a map of the coasts of the eastern Mediterranean and Mesopotamia with a detail of the Holy Land, Palestine (similar to the inset on the coastal map), large-scale maps of the Italian peninsula (one- and two-page versions), and maps of Lombardy and Ferrara, all from the early fourteenth century.

Another source of geographical information is Francesco Balducci Pegolotti's *Libro di divisamenti di paesi*, usually known as *Pratica della mercatura* (*Merchant's Handbook*, c. 1340). It was of considerable value to commercial traders and travelers during the fourteenth century, as it

described trading customs and chief trade routes.

Land Management

Along with the legacy of itineraries from the Roman empire, medieval Italy also inherited from the Roman *agrimensores* a tradition of large-scale mapping (or centuriation) of landholdings. The primary source of information about this form of geographical description is *Corpus agrimensorum*, of which the earliest illustrated manuscript can be traced back only to the fifth or sixth century, even though it clearly contains treatises composed as early as the first century after Christ describing a practice that started as early as the fourth century B.C. Although the early medieval period yields manuscripts of this tradition, this form of land division was not continued anywhere in Italy after the fall of the Roman empire, except as fossilized in a checkerboard landscape. Apart from diagrammatic plans of Rome and Jerusalem, the earliest large-scale territorial map of which we have a record is one of the Monferrato in a manuscript of 1292. It is unlikely that later large-scale medieval maps were related to those of the *agrimensores*; it is more likely that the earlier tradition of republican Rome died out and was replaced by one responding to different needs. It is difficult to estimate the extent to which the paucity of the record is biasing the picture; Harvey (1987) has characterized medieval Europe as a society that knew little of maps. Yet the existence of isolated examples of maps, such as that of the Monferrato, and a reference to a "professional surveyor" of Milan known as Hellia Magadizzo, responsible for a plan of Venice from the fourteenth century, suggest that other evidence may still await discovery.

Sea Charts

Venice, Pisa, Genoa, and Amalfi—independent maritime republics—are recognized as early leaders in the commercial maritime trade in the Italian peninsula during the eleventh to the fourteenth centuries. Genoese mariners spearheaded the earliest marine exploration outside

the Mediterranean. In 1291, the brothers Ugolino and Vadino Vivaldi planned a voyage down the coast of eastern Africa in search of a sea route to Asia, but they were lost in the Atlantic. Two of the Canary Islands—Lanzarote and Gomera—were reached in 1336 by an expedition led by Lanzarotto Malocello in the service of Portugal, and these appear on the Dulcert portolan chart of 1339. In 1341, Nicoloso da Recco and the Florentine Angelino del Tegghia sighted all the islands in the archipelago. Later in the fourteenth century, Italian navigators pushed further into the Atlantic, naming Madeira "Legname" and reaching the Azores during the tenure of Lanzarote Pessagno as admiral of the Portuguese navy (1365-1385).

An improvement in navigational skills and instruments went hand in hand with this expansion. Sea charts, now known as portolan charts, survive from the late thirteenth century and are celebrated for their astounding accuracy, the origin of which has been a subject of much speculation. Most of the fourteenth-century examples are either Genoese or Catalan in origin. Despite its name, *Carte pisane*, bestowed originally because of its supposed provenance from a Pisan family, the oldest extant example in the Bibliothèque Nationale in Paris is often considered to be of Genoese workmanship and is usually dated to the last quarter of the thirteenth century. A chart in the Biblioteca Comunale in Cortona (the "Cortona chart") may be the second oldest in terms of compilation, if not drafting, for its sketchy representation of France and Belgium is similar to that in the *Carte pisane*, it has an unusual and clear representation of the Danube River and would definitely repay further study.

Pietro Vesconte also declared himself to be Genoese, but he was working in Venice on the two occasions when his work mentions the place of manufacture; he is responsible for one chart of the eastern Mediterranean (dated 1311) and seven atlases dating from between 1313 and c. 1325, some of which are associated with the *Liber secretorum* of Sanuto; Vesconte was the first chart maker we know of who routinely dated and signed his work.

A chart signed by "Giovanni the priest, rector of Saint Mark's in the port of Genoa," associated with Giovanni da Carignano, was missing and presumed destroyed in Florence in 1943. It is often put forward as the earliest signed chart and assigned an early date of 1300 or 1310, but

the evidence of geographical content points to a more likely compilation date in the late 1320s, toward the end of Giovanni's life.

Italian charts seem to be the earliest to show town views as small vignettes with a modicum of verisimilitude. The atlas of the brothers Domenico and Francesco Pizigano (1367) contains an unmistakable Campanile in its vignette of Venice; the atlas signed by Francesco alone six years later may represent the first attempt to depict Genoa in a portolan atlas.

Other chart makers or charts do not fit as clearly within the scope of this essay. There is, for example, controversy over the Italian origins of Angelino da Dalorto, whose chart of 1325-1330 is in the Catalan style. And the so-called Medici map, usually dated 1351 from a date found on a calendar in the atlas, has now been dated to the first half of the fifteenth century on the basis of toponymic evidence.

The tradition that the magnetic compass was invented in Amalfi by Flavio Gioja at the beginning of the twelfth century rests on scant foundations; but allusions by several commentators—including Alexander Neckham, a professor at Paris (c. 1180-1190); Guyot de Provins, a satirist of Languedoc (c. 1203-1208); and Jacques de Vitry (1218)—to the uses of magnetism for navigation are good evidence that there was some, if not common, use of this device. The development of the device just before the appearance of the portolan charts, as well as a general easterly twist in the orientation of these charts, has led many scholars to postulate a direct causal relationship between the two. Some evidence for this is compelling, but it should also be recognized that the use of the compass was by no means as widespread as is sometimes claimed, nor was its precision as great as has sometimes been supposed.

Literature and Geography

The geographical allusions in the great Italian literature of the fourteenth century have not been the subject of a general work, although many books and articles on specific subjects have appeared. Dante, whose combination of poetry and an understanding of natural science has probably never been equaled, nevertheless preferred the literary and scholarly tradition represented by his teacher Brunetto

Latini and Ristoro d'Arezzo, rather than the empirical tradition represented by the activities described above. Even in his strict treatment of a scientific question, whose authorship is disputed, on the relationship between water and land—*De situ et figura, sive forma, duorum elementium, aque videlicet et terre*—he was not particularly original; he selected and propounded the most attractive theories of the time and, on the weight of his reputation, encouraged their persistence. Like Dante, Boccaccio was also more indebted to the learned tradition than to the reports of travelers, merchants, and missionaries of the thirteenth and fourteenth centuries.

Geography: Physical

The medieval period saw the transformation of the Italian landscape from Roman to modern. The factors involved in this changing geography were not specifically medieval, nor was the pace or direction of change peculiar to the medieval period. Rather, the postmedieval landscape emerged from a convergence of physical and cultural tendencies that had already been present in classical times. The result was a landscape which by the end of the Middle Ages had more in common with that of today than with that of the Roman or early medieval period.

Some of the most remarkable changes that took place throughout the

medieval period concerned the physical geography of Italy. By the end of the fourteenth century, much of the coastline and many valleys would already have been unfamiliar to a Roman. Coastal indentations were being smoothed out, valleys were being filled in, and rivers were swinging into new courses. Sand, silt, and marshes were fast accumulating at the heads of bays and in lagoons while rivers prograded their deltas, filling the estuaries. Travelers would already have been using roads that crossed these former estuaries and ran along now unbroken shorelines. Lagoons once sailed by Roman and early medieval craft bound for inland ports were stagnant and marshy, their channels blocked, their fish stocks reduced, and the ports vanished or in decline. The situation was similar inland. Shoals of silt and sand choked river channels. Floods receded, leaving new courses. Marsh encroached on cultivation. At Salpi (Roman Sa-lapia) in Apulia, vineyards that had surrounded the city since Roman times were engulfed by marsh vegetation. Today, they are discernible only on air photographs or from documentary records.

None of this was new. The late Roman period had already suffered the inconvenience of encroaching marsh and advancing deltaic silts. Estuarine ports lost first trade, then inhabitants, and by the seventh century were in a decline from which some, like Luni (in Liguria), never recovered. Even where urban life did redevelop, in the ninth and tenth centuries, the environmental problems remained. Toward the end of the ninth century a canal was cut at Ferrara (Emilia) to divert stagnant water from marshy areas around the town toward the Po. By the eleventh century, vast tracts of those northern lowlands were being drained, diked, and reclaimed for agriculture. At Mantua, leases bound tenants to keep the banks protecting their land from flood in good repair.

Up to a point, the adversity was natural. Physical factors were working against human endeavor. The general (eustatic) level of the sea is thought to have reached a high point roughly between the years 1000 and 1200. This alone would have increased the risk of flood and siltation. But in addition, in some districts, the land itself tended to sink for tectonic reasons. And from c. 800 to the 1300s, Italy's climate, like that of Europe in general, seems to have "improved," shifting toward slightly higher average annual temperatures and total rainfall.

The latter change was a double-edged advantage. The moist warmth brought some immediate benefits. New crops (sugar, cotton, rice, silk, melons, the date palm, the pistachio tree) were introduced into Sicily, where they were largely dependent on irrigation or took their place in intensive *huerta* agriculture. Other consequences of this unusual proximity of Saharan warmth were fortunately rare, such as the plague of locusts that devastated Apulia in 1231 and led Frederick II to offer a reward for every basketful of the insects gathered. At the same time, these benign conditions, together with the upward swing of the demographic curve in the twelfth and thirteenth centuries, encouraged expansion of settlement up into the hills and mountains. The *agri deserti*—abandoned fields—that had characterized the landscape of the lowlands since the fifth and sixth centuries were coming under the plow again as the demand for arable land intensified. However, clearance of scrub and forest for cultivation exposed the soil to erosion. Erosion led to siltation. Human activity was exacerbating the physical adversities to which the environment of so much of Italy is prone. For instance, the new forms of land use tended to leave the ground without plant cover during the wet winter months, even where the mountain slopes were replanted with sweet chestnut (the staple food of the poor), as in the Apennines, or with hazel, as in Campania; or where entire hillsides were terraced, as in Emilia. In upper Italy by the thirteenth century, exploitation of the great riverine forests of the Arno, Serchio, and Po led to complaints of shortages of timber, fuel (especially industrial fuel), and other forest resources. By the time the late fourteenth century brought a return to cooler, wetter, and stormier weather, the ecological tendency had set hard. Rain fell mercilessly on freshly created arable and newly planted, but often clean-tilled, fields and deciduous chestnut woods alike, washing the fine soil into the streams.

There were additional problems in much of the Apennines, where *frane* (landslips) let sandy strata literally slide off the underlying clay beds. In a country where three-quarters of the land is officially classed as hill or mountain, and thus at risk of erosion, the medieval intensification of settlement patterns and associated land use almost inevitably brought further instability. It is possible that as much silt was deposited along the valleys and coasts of Italy in the sixteenth century

alone as in the whole of the medieval period, but there can be little doubt that human activity throughout the preceding medieval centuries was a major factor in these changes.

Other aspects of the physical landscape of medieval Italy were different from those today. During much of the Middle Ages, the main rivers seem to have been much fuller, for instance. In Apulia, boats reached Civitate (ancient Teanum Appulum), some 5 leagues (about 9 miles, or 15 kilometers) up the Fortore, and a similar distance up the Ofanto. In Sicily, the Erminio and San Leonardo rivers were navigable. A five-span bridge was built in 1113 in Palermo over the Oreto where one span would suffice today. And in Liguria as late as 1384, a shipping company was established at Sarzana, 6 miles (10 kilometers) up the Magra.

In addition to contrasts in the physical landscape, within regions and from region to region, the human geography of medieval Italy was also diverse. This diversity was chronological as well as spatial. Changes in social structure, land tenure, and land use tended to occur at different times throughout the country or even within a single region. The contrast between northern and southern Tuscany in the twelfth century, for instance, or between west and east in the Po lowland (Lombardy and the Veneto, respectively), could be as fundamental as the contrast between upper Italy on the one hand and Lazio, the south, and the islands on the other. Detailed information is uneven, either because data are lacking or because studies are, for the moment, inadequate. Broadly speaking, however, the geographical individuality of Italy in the Middle Ages is conveyed in the contrast between intensive and extensive land use. This regional diversity was above all a function of demography.

From c. 1100 to 1350, the population in Italy grew. One estimate suggests that the increase was from some 5 million people to 7 million or 8 million. Despite the black death and other plagues of the middle and late fourteenth century, which in fact left many districts little affected, some regions—such as parts of Tuscany around Pistoia and San Gimignano—seem to have achieved rural population densities not surpassed until the nineteenth or twentieth century. Whether consequent on or independent of the demographic trend (it is not always clear), changes in agrarian management initiated in the tenth

century had by the thirteenth century transformed rural life and the rural landscape in three fundamental respects: the old feudal system was all but eliminated; agricultural production had been vastly increased and diversified; and what was to be the settlement pattern of modern times was already being established.

Italy was precocious with respect to the disappearance of the manorial system in upper Italy even before its real establishment in the south under the Normans. By the fourteenth century, a new agrarian system had replaced the old feudal one. Personal services had given way to fixed (money) rents or to commercial (share or *mezzadria*) tenancies. Direct farming of demesne land was replaced by indirect farming through family-size tenant farms (*poderi*) that often drifted into peasant proprietorship. Such changes in the structure of society had their counterparts in the landscape as the nature and pattern of rural settlement were altered. Unfortified *ville*, like the fortified *castelli* that had sprung up in response to the threat of foreign invasion and internal disorder in the ninth century, were abandoned. The *castelli* were left as places of refuge or were used by farmers as stables or barns. While smallholders remained in the villages, so that these nucleations remained reserves of laborers and artisans, farmers went to live on their fields. The new farmsteads that were built on these *poderi* underlie much of the modern pattern of rural settlement. Tracks linking the hilltop *castelli* were abandoned for valley routes. In regions of intensive farming, such as northern Tuscany and much of the Po plain, especially in Lombardy and Emilia, farmers enclosed their land, using vines and to a lesser extent olive trees as hedges. They practiced *coltura promiscua* (mixed land use). Viticulture was encouraged by many landlords in the fourteenth century, as was, though to a lesser extent, the growing of olives. After the fourteenth century, northern Italy took over from the south and Sicily as the center of silk production. Mulberry trees as well as dye plants began to be grown in Lombardy around Milan, and in Tuscany around Lucca. On arable land within the closes, or between the olive and mulberry trees, wheat, barley, sorghum, and millet were grown. On irrigated land, several grass crops a year could be taken, and flax and other industrial plants were produced for the urban centers. In Lombardy and elsewhere in the Po plain, where canals for navigation had continued to be built since the

twelfth century and where the upper plain is watered by *fontanili* (springs), there was plenty of water for irrigation. Irrigation ensured an abundant supply of fodder, which in turn supported an increase in livestock in response to a growing demand from the relatively affluent towns for meat, leather, and above all wool.

Little of this agricultural innovation and dynamism characterized southern Italy after the early part of the period. Here, the agrarian structure remained dominated by feudal estates (*lati-fondi*) or by common field farming with fragmented holdings farmed from centrally located, and often very populous, unfortified villages (*castelli*). This situation was reflected in the landscape. Each village was surrounded by a zone of intensively cultivated enclosed plots containing vineyards and orchards as well as arable land. Beyond that zone stretched a seemingly endless expanse of hedgeless, dry-farmed cereal land. A three- to five-year fallow period was the rule; in drier areas, five years were typical. Like stubble after the harvest, a fallow field was systematically grazed and thereby manured. Yet despite the manure, cereal yields in the south seem to have been low. Average returns would have been four- or fivefold rather than the tenfold or even higher yields anticipated by some contemporary optimists. The ability of the granary districts of the south, such as interior Sicily or the Apulian Tavoliere, to produce regular grain surpluses is explained less by any inherent fertility than by the fact that these regions had a relatively low urban (i.e., non-food-producing) population.

Under the Hohenstaufen and the Angevins, farming in the kingdom of Naples was rigidly organized. The royal demesne was administered on a provincial basis. The *masseria* (estate centers) were managed, as in Lombard times, by an overseer who often had to work to written instructions sent from the court. After exceptionally good harvests, surplus grain from all communities was bought up by the crown to be sold at inflated prices in times of need. The hard wheats of Apulia were favored because they stored well (up to fifteen years); they were kept in underground silos like those at Foggia and Cerignola in Apulia. It was the crown, too, that from the thirteenth century onward promoted the large-scale institutionalized pastoralism of the south, which led to interregional transhumance and which by the late fourteenth century was threatening village land use and even the villages themselves.

However, the decline and desertion of settlements was as characteristic of upper Italy as of the south. Desertion of settlements was not an exclusively medieval phenomenon: many of the older Roman settlements had already declined by the time of the invasions that saw the collapse of the Roman empire, or during those invasions. The new economic opportunities of the fourteenth and fifteenth centuries, however, provided yet another set of circumstances in which some settlements prospered at the expense of others. A significant factor was the conversion of land use as grain prices slumped relative to rising wool prices. The grain market was stagnant as a result of the falloff in total population and was disadvantaged by the increasing demand from the relatively prosperous urban sector for meat and other livestock products. At the same time, in Italy as in Europe in general, the wool industry was expanding. From north to south, all categories of livestock were on the increase; no one group, however, increased more than the ovi-caprines (sheep and goats).

The greatest frequency of desertion of villages was correlated with regions of surviving feudalism, or those dominated by a grazier economy with its large-scale transhumance; and this correlation is too close to have been a mere coincidence. For instance, about 10 percent of Tuscan villages disappeared during the fourteenth and fifteenth centuries; however, farther south the proportion rises to 25 percent in Lazio and 50 percent in Sardinia, Sicily, and the Tavoliere of Apulia. Even within a region the frequency of desertion seems to have varied, presumably in relation to the same factors. Thus the figure rises for some parts of Tuscany to 20 percent for villages and nearly 70 percent for hamlets or isolated homesteads. For similar reasons, the desertion of settlements had a greater effect on lowlands and plains than on mountain regions, where, among other things, estates tended to be more fragmented.

Italy was also precocious in western Europe with regard to the emergence of its towns. In large measure, the urban infrastructure was inherited from Roman times. For some Roman towns, especially in the south, their decline during the late empire or the early medieval period proved final. Ports like Ostia (which served Rome, Luni, and Cosa) and inland towns like Ortona, Saepinum, Alba Fucens, and Veii failed to recover even with the improved economic and political circumstances

of the tenth and eleventh centuries. Elsewhere, though, especially in the north and center, where perhaps three-quarters of the Roman towns have survived to the present day, medieval town life regenerated within the carcass of the Roman site.

The growth of urban economies, with their increased purchasing power, was a critical factor in the social and economic dynamism that characterized Italy from the eleventh century to the early fourteenth. The towns of Byzantine and papal Italy—Ravenna and Rome, Bari and Amalfi—were first to gain in importance, as early as the tenth century. Ports in general prospered, in the north as in the south. Gradually, as trade routes were redefined, inland towns too were able to take advantage of the economic upsurge. New towns were created on new sites. Some, like Manfredonia in Apulia (founded in 1253, about 2 miles, or 3 kilometers, north of Roman Sipontum) were laid out as much to replace an earthquake-shattered settlement as to secure trading and political advantage through the prestige of a new royal endowment. Some, like Ferrara, where new quarters had been created toward the end of the ninth century, derived additional prestige from systematic planning: the *Addizione Ercolea* of 1498 at Ferrara represents the earliest attempt at urban planning in the Renaissance. In the Venetian lagoon, former villages like Torcello had been endowed in the tenth and eleventh centuries with a basilica and other major monuments. Other towns gained at the expense of decayed and derelict Roman centers: the end of Roman Luni (in Liguria) was finally signaled by the removal of its bishopric in 1204 to the small town of Sarzana.

By 1300, a three-tiered urban hierarchy existed. At the head, outstanding for their size in the whole of Europe, were the four "great cities": Milan, Venice, Genoa, and Florence, each with a total population approaching 100,000. Next in rank came a group of towns varying from 20,000 to 50,000 inhabitants: most of these (including places such as Pisa, Siena, Lucca, Bologna, Padua, Pavia, Verona, Mantua, and Perugia) were in the north; only three (Palermo, Naples, and Messina) were in the south. At the base of the pyramid were the small towns, with populations between 5,000 and 20,000; these small towns were almost exclusively in the north. The great cities depended on trade for their survival, since they could not possibly provide sufficient food from their own territory for their populations. Florence, for example, had

enough from local supplies for no more than five months a year. Likewise, for places like Venice and Genoa with agriculturally disadvantaged hinterlands, the securing of trade monopolies also ensured economic as well as political survival. The vast majority of urban centers could depend directly on their own territory for food and other supplies, but even in these cases the policy was to establish an urban hegemony over the entire commune as a means of economic as well as political gain.

Urban authorities fixed the prices of rural produce and might also fix the agricultural calendar itself. The earliest date for the *vendemmia* (wine harvest) and the minimum number of plowings before sowing was permitted (four at Bologna and Reggio, three at Parma and Modena) were matters to be decided by the town council. Some councils insisted on a minimum annual acreage of certain crops (hemp, flax, and sorghum at Modena, for instance). In part, the close link between town and country was a function of the way the urban centers had developed since the thirteenth century, when their governments could still include landlords who owned serfs. Gradually, not only the rights of these feudal lay and ecclesiastical lords but also their lands were taken over by the commune. But gradually too, the functional dichotomy grew more pronounced—the *contadini* producing and the townsfolk manufacturing and consuming. As far as possible, industrial raw materials—wool, hemp, flax, leather, dyes, pitch, domestic and industrial fuel, building timber, brick earths, quarry goods, and metals—as well as foodstuffs came from the local territory. It was this sort of intense exploitation of forest, field, and mountain that contributed so much to the changes in the landscape of medieval Italy.

George of Antioch

The multilingual George of Antioch (d. 1151) was a leading figure in Norman Sicily during the formative years of the kingdom. Antioch, in northern Syria, was then an ethnically diverse city; it had been under Islamic rule from late 1084 until its capture by crusaders in 1098 and was from 1099 on the capital of a Frankish principality founded by a southern Italian Norman, Bohemond of Taranto. According to later Arab accounts, George, a Greek Christian, began his career in Syria as a financial administrator and later entered the service of the Zirid rulers of Mahdia in present-day Tunisia, where he became the chief fiscal officer. Sometime between 1108 and 1114 he moved on to Sicily, which was ruled by the Normans but was still largely Arabic-speaking. Here he served Count Roger II in administrative, diplomatic, and military capacities, achieving the rank of *amiratus* (emir), a title of Arabic origin now usually translated as "admiral" but at the time by no means restricted to purely naval competencies. On the death or retirement of Admiral Christodulus, usually placed in or shortly after 1126, George was the court's most powerful official. By 1133, he had added to the Greek form of his title (*amerâs*) the phrase *árchon tôn archón-ton* (archon of archons, or magnate of magnates), signifying chief minister. Contemporary and later Arab sources refer to him correctly as Roger's vizier.

With the creation of the kingdom in 1130 George became more widely known abroad as an executor of his sovereign's policies. He

commanded the fleet in the subjugation of Amalfi in 1131 (the land forces were commanded by another admiral, John). George also led naval expeditions against Pisa in 1134 and 1135, as well as a series of campaigns in North Africa during the 1130s and 1140s that ended in the conquest first of Tripoli (1146) and then of Mahdia and adjacent areas (1148). It was probably George who directed the campaign against the eastern Roman (Byzantine) empire in 1147-1148 that involved the occupation of Corfu, the invasion of Boeotia, the sack of Thebes (and the abduction to Sicily of some of its silk workers), the sack of Corinth, and later raids on Athens and Euboea. In a second campaign in 1149 George raided the outskirts and harbor of Constantinople, shooting flaming arrows into the Blachernae palace, and won a battle off the Peloponnese that released the crusading French king Louis VII from the custody of the eastern Roman navy. In a subsequent engagement, several Sicilian ships were taken by elements of the emperor Manuel's fleet while Louis escaped toward Italy. George did not always sweep the seas for Sicily.

We are poorly informed about George's domestic administrative activities. He was almost certainly responsible for a major reform of the *duana*, a fiscal office whose structure and precise functions remain controversial; and he presided over the transformation of the central government from a comital staff to a bureaucracy capable of handling the affairs of a kingdom. His role in the building of the Admiral's Bridge at Palermo, a masterpiece of Arab-Norman stone construction, is often referred to as fact but cannot be confirmed from the surviving records. The bridge is not precisely dated, and there were other admirals after whom it could have been named. George's undisputed monument in Palermo is his church of Saint Mary of the Admiral, now also known as the Martorana. This church was established shortly before 1143 as a Greek-rite foundation and was originally designed in the form of a Greek cross within a square; it has since been much rebuilt. Among its famous mosaics are a widely reproduced depiction of Christ crowning *Rogérios Réx* ("Roger, King," a Greek phrase consisting of Latin loanwords) and a dedicatory portrait of George, prostrate at the feet of the Virgin.

Gerardo Pateg

Gerardo Pateg, a Lombard poet from Cremona, lived in the first half of the thirteenth century. His given name is also spelled Gherardo, and Pateg is pronounced *Patèc*; its Tuscanized form, once widely used, is *Patècchio*.

Two works of Gerardo's have survived: *Splanamento de li proberbii*

de Salomone (*Explanation of the Proverbs of Solomon*) and the so-called *Frotula noie moralis* (*Poem on Troublesome Things*). The first, *Splanamento*, is a didactic poem consisting of 606 alexandrines in rhymed couplets, preserved in a thirteenth-century manuscript of Venetian origin and hence, linguistically, not very reliable: Berlin, Staatsbibliothek, 390 (Saibante Hamilton), cc. 86-96. In this work Pateg "explains"—i.e., freely translates into his Lombard vernacular—the maxims contained in two books of the Bible (*Proverbs* and *Ecclesiastes*), taking the liberty to insert here and there popular sayings drawn from different sources. The content is arranged thematically. After a short introduction in the name of the Lord (verses 1–20), the following subjects are treated: (1) how to use and restrain one's tongue (verses 21-112); (2) the vices of pride and wrath versus the virtue of humility (113-190); (3) the shameful behavior of *mati* ("foolish") worldly men (191-264); (4) how to deal with women (265-334); (5) friends and friendship (335-404); (6) wealth and poverty (405-478); (7) miscellany (479-596). At the end (597–606) Gerardo enumerates the crucial topics he has just covered and invokes God's assistance, thereby resuming the prayerful cadence of the prologue.

Frotula noie moralis is shorter and much lighter in tone. It was apparently appreciated and recopied over a longer period of time. As a result, we must read it in a late-fifteenth-century notebook (Milan, Brera or Braidense Library, AD XVI 20) penned by the Milanese humanist Bartolomeo Sachella; not only is this inconvenient, but Sachella's knowledge of medieval Lombard was far from sure. The title *Frotula noie moralis* was introduced by Sachella, who was himself a *frotulista*. Friar Salimbene da Parma (1221–c. 1290), who wrote a Latin chronicle in which he repeatedly mentions Pateg (as Girardus Pateccclus), called the poem *Liber Tedium* or *De Tediis*. It is, in fact, a Lombard *noia*, whose Provençal model was provided by the four *Enueg* of the Monk of Montaudon (twelfth century). As a genre, the *enueg* (also *enoi*) could be considered a comic counterpart of the *plazer*, a lyric mode that, at the beginning of the fourteenth century, was to find a remarkable poet in Folgòre da San Gimi-gnano. In the *plazer* most pleasurable things and situations, according to a refined aristocratic taste, are dreamed of in a nostalgic and lyrical vein; by contrast, the *enueg* assembles lists of annoying and irritating items, and

the outlook we may perceive behind such fastidiousness, at least in the Lombard production, is mainly bourgeois and at times even Goliardic (as in "the fussy whore," "the old lecher," etc.). This is not to deny, of course, that by the beginning of the thirteenth century wealthy bourgeois could have acquired or affected aristocratic manners and penchants. Pateg's *noia* (verse 84), called by its author *canzone* (80) or *canzoneta* (81), is addressed to a fellow citizen of Cremona, Ugo di Perso or Persico (82). It consists of eight stanzas (plus envoi), whose rhyme pattern is invariably abababccc, and so on (envoi: zzzz). The verse, which seems to contain nine or ten syllables, probably derives from Montaudon's masculine (or oxyton) octosyllables. In Sachella's notebook the poem is followed by two "replies in kind" (*nsposte per le rime*-, verses 70 and 84) composed by Ugo di Persico. All three poems were once attributed to Pateg and at one time were even read as texts reflecting the heretical opinions of Lombard Catharism (Pataria); they are usually referred to as *le noie cremonesi*. With regard to this genre, it is worth mentioning that in 1259 Salimbene himself wrote a *Librum Tedium ad similitudinem Pateccli* in his chronicle.

Gherardello Da Firenze

Gherardello (*Ser Ghirardellus*, Niccoló de Francesco; 1320s-c. 1362 or 1363) was a member of the middle generation of Florentine *Trecento* composers. Like many of these composers, he became a cleric, first in the service of the cathedral of Florence; he was ordained in 1345. In 1351, he entered the Vallombroian order, taking the name Gherardeilo. Later he became prior at the Florentine church of San Remigio. We know that he had a son, Giovanni, and a brother, Jacopo, who were both also composers, but of their reported music nothing has survived.

Gherardello himself was highly esteemed in his day, especially for his sacred works. Of the sacred works, only two movements for the mass have survived; these suggest familiarity with French *ars nova* styles of the period of Machaut. However, a small and important body of Gherardello's secular pieces is preserved in the famous Squarcialupi Codex, which also contains a portrait that is apparently his. These pieces consist of five monophonic *ballate*, ten two-voice madrigals, and a single three-voice *caccia*, one of the most famous of its type. Stylistically, Gherardello followed a conservative tradition, particularly as identified with the work of Giovanni da Cascia. Gherardello somewhat extends the part-writing techniques, though he limits florid passages in the monophonic pieces; his madrigals mix contrasting passages of syllabic simplicity with melismatic flourishes.

Ghibelline

The term "Ghibelline" emerged in the mid-thirteenth century to designate the Italian partisans of Emperor Frederick II Hohenstaufen (r. 1220-1250). Their anti-imperial opponents, known as Guelfs, often collaborated with the papacy against the emperor and his allies. Neither

term necessarily indicated a direct or firm attachment to either the empire or the papacy. Rather, these terms served as convenient labels for parties to the fierce political and social struggles that afflicted northern and central Italy before, during, and after the struggle between Frederick II and the church. Feudal magnates, communes, and urban factions readily adopted the Ghibelline-Guelf nomenclature in their brutal and relentless competition for power, status, and resources. Control of Italian city-states frequently oscillated from one party to the other according to the prevalence of one or another internal faction or in response to external factors. The many permutations of Ghibelline and Guelf, whatever their provenance or specific applications, reflected the increasing economic complexity and chronic political instability of the Italian communes in the thirteenth and fourteenth centuries.

The words Ghibelline and Guelf are italianate versions of German battle cries used during the dynastic wars of the mid-twelfth century between the Hohenstaufen emperors and the Welf dukes of Bavaria and Saxony. "Waiblingen," a Hohenstaufen fortress in Franconia, became "Ghibelline" in Italy; "Welf" became "Guelf." These terms apparently migrated to Italy during or perhaps just after the imperial expeditions of Frederick I Barbarossa (r. 1152-1190). The intrusion of the emperor into Italian politics had a strong polarizing effect, especially on the communes. Pro-imperial and anti-imperial coalitions and parties emerged throughout Italy. Anti-imperial magnates and communes made common cause with the papacy to thwart the ambitions of Barbarossa. So, too, popes Gregory IX (r. 1227-1241) and Innocent IV (r. 1243-1254) coordinated their efforts to destroy Frederick II and the Hohenstaufen with those of anti-imperialists in Liguria, Piedmont, Lombardy, the Romagna, and Tuscany.

Ghibelline and Guelf were first used as partisan designations in Florence during the 1240s. These labels quickly spread throughout Tuscany and beyond. By 1250, Ghibelline and Guelf factions, parties, and diplomatic alliances were present and active in every part of northern and central Italy. Although the papacy was deeply involved in the struggle against the Hohenstaufen, allegiance to the papacy was seldom a major factor in the partisan antagonism that surfaced or in the political coalitions that were formed. In practical terms, the popes were much like the other Italian magnates who fomented strife and

constructed alliances to cope with imperial power. In those cases where the terms Ghibelline and Guelf signaled broader political loyalties, they indicated support for or opposition to the claims and policies of the Hohenstaufen until Charles I of Anjou defeated Manfred and Conradin (in 1265-1268). After 1268, the main external issue became support for or opposition to the political axis of the Angevins and the papacy. More commonly the labels designated the parties to local or regional political conflicts.

The participants in many specific struggles, especially those in Tuscany, adopted the terms Ghibelline and Guelf as party labels; but the ever-shifting political landscape of thirteenth- and fourteenth-century Italy complicates any effort to characterize the actual parties, even within the relatively straightforward context of the conflict between the papacy and the Hohenstaufen. Feudal magnates seem to have been more willing than communes to align themselves with or against the Hohenstaufen or, after 1268, with the alliance between the Angevins and the popes. Those magnates who wished to exploit imperial power or the idea of empire to solidify or extend their lordships adopted the Ghibelline label. Thus many Ghibelline parties were essentially aristocratic factions. In some cases, as during the siege of Parma in 1248, major urban factions refused to become actively involved in what they considered a dispute among magnates.

Several Ghibelline magnates established local or regional lordships, or *signorie*, in Tuscany, the Romagna, Piedmont, and Lombardy. During the last years of the Hohenstaufen, these lords included Ezzelino da Romano (in the Veneto) and Uberto Pelavicini (in eastern Lombardy). During the first three decades of the fourteenth century, they included Guido da Montefeltro (in the Romagna), Matteo Visconti (in Milan), Cangrande della Scala (in Verona), Tommaso di Savoia and Guglielmo da Monferrat (in Piedmont), Ugucione della Faggiuola (in Pisa), and Castruccio Castracani (in Lucca).

The great age of Ghibelline communes corresponded to the reign of Manfred of Sicily (1258-1266). Manfred was particularly strong in Tuscany and eastern Lombardy. Staunchly Ghibelline communes included Arezzo, Pisa, Faenza, and Mantua. The high point of the Ghibelline cause in Tuscany, and of the Ghibelline communes generally, was the battle of Montaperti in 1260: the Tuscan Ghibellines crushed

the Guelf forces, seized control of Florence, and exiled the Guelf leaders. However, the Guelfs regained Florence in 1266 and initiated another round of exiles. The final victory of Charles I of Anjou over the Hohenstaufen in 1268 accelerated the destruction of other Ghibelline communal regimes. Siena, Lucca, Pistoia, and Forlì fell to the Guelfs by 1280. Many politically divided communes—such as Bergamo, Brescia, Cremona, Ferrara, Genoa, Padua, Pavia, Rimini, and Vicenza—fell to Guelf parties in the late thirteenth or early fourteenth century. By 1300, the term Ghibelline usually identified either opposition to the papacy and the Angevin kings or membership in a local or exiled faction of that name. Only occasionally did the two identities overlap.

In the first half of the fourteenth century, Ghibelline factions took control of a handful of communes, but by then the traditional party labels seldom had more than local significance. The Italian expeditions of emperors Henry VII (1310-1313) and Lewis the Bavarian (1327-1330) and King John of Bohemia (1330-1332) lent confidence to Ghibelline exiles and offered support to several northern Italian Ghibelline *signorie* that were established between 1310 and 1328. The expedition of Henry VII may have inspired Dante to write *Monarchia*, his treatise on universal government. Marsilius of Padua wrote *Defensor pads* in support of the imperial claims of Lewis of Bavaria. Imperial intervention in Italy produced limited and temporary effects. Throughout the 1320s, the forces of Pope John XXII (r. 1316-1334) and his Angevin and Guelf allies warred relentlessly against the Ghibelline lords of northern Italy. The pope also used the accusation of heresy to undermine Ghibelline *signori*, especially the Visconti of Milan. Neither the emperors' nor the popes' efforts to take hold of Italian politics succeeded. Savage local and regional rivalries continued to dominate the scene.

Within the city of Rome, the terms Ghibelline and Guelf meant little. Baronial or communal factions sometimes adopted a pro-imperial stance, but usually in opposition to the papacy or another local faction. The Colonna family led a peace party that more or less doubled as the pro-imperial party in Rome, but they were mainly concerned with containing their enemies— the Annibaldi, the Orsini, and the Caetani. Partisan labels carried greater meaning in the papal state than in Rome itself. Urban factions engaged in violent conflicts with the feudal

magnates of the Romagna and within the larger cities, such as Bologna. The papacy briefly abandoned its partisan support for the Angevins and Guelf communes during the pontificate of Gregory X (1271-1276), who attempted to reconcile the factions of Tuscany, and that of Nicholas III (1277-1280), who negotiated a truce between Guelf Bologna and the Ghibelline magnates. These attempts to make peace failed almost immediately. Pope Martin IV (r. 1281-1285), a Frenchman, returned the papacy to more familiar ground. He strengthened it with the Angevins and launched an offensive against Ghibelline *signori* up and down Via Emilia. In the mid-fourteenth century, Cardinal *Albornoz* enjoyed modest success against the stubborn Ghibelline lords of the Romagna. He achieved this with a combination of force and inducements meant to defeat the *signori*, reconcile them to papal government, or both.

In all Italian communes, the victory of one party resulted in the exile of leaders of the defeated party, confiscation of their property, and loss of their political rights. As Guelf parties progressively established their predominance in communal Italy, accusations of Ghibelline sympathies often served to settle local grudges and justify profitable confiscations. Political exiles routinely negotiated their return to their cities, but they usually had to pay large fines and accept the loss of property and rights. Some parties in exile, especially in Tuscany, were able to retain their corporate identity—complete with captains, councillors, and treasury—as they struggled to regain power in their cities. More commonly, individual exiles negotiated the terms of their return, joined like-minded forces in other communes, or became mercenary soldiers. Even though the imperial connection lent a certain glamour and dignity to Ghibelline exiles, many of them could find work only in the armies of Manfred or the Ghibelline lords.

Political conflicts divided Italian communes well before Frederick II entered the picture, and they continued to do so long after the Angevins and the papacy had exterminated the Hohenstaufen. Family and party allegiances existed independently of imperial, royal, or papal considerations. However, the presence of the Hohenstaufen in Italy magnified local conflicts, as lords, communes, and factions attempted to exploit or to block imperial power. The formation of distinct Ghibelline and Guelf parties contributed substantially to the factional strife and political instability that chronically vexed northern and central Italian

communes in the thirteenth and fourteenth centuries.

Endemic factionalism encouraged division, indecision, and weakness in communal government, which left many cities unable to generate adequate revenues, maintain public order, or meet external threats. In the thirteenth century, powerful lords began to fish in these troubled waters; they offered the communes a firm hand on the rudder in turbulent seas. By the second half of the thirteenth century, would-be *signori* were collaborating with interested communal factions to secure *signorie*. As a *podestà*, captain-general, or captain of the people (*capitano del popolo*), a feudal magnate or warlord (*condottiere*) exercised substantial executive power within a commune, although usually through existing republican forms. The durability of individual lordships varied from place to place, but by the mid-fourteenth century they had become the norm. The intrusion of imperial power into Italian politics, and the subsequent emergence of deeply antagonistic Ghibelline and Guelf parties, greatly accelerated the establishment of *signorie* in communal Italy.

Giacomino Da Verona

Giacomino da Verona (thirteenth century) was a notable figure in both Lombard (northern Italian) and Franciscan literature. He is known for two vernacular poems: one about paradise (in 1,108 verses) and the other about hell (in 1,348 verses). The verse form is caesured

alexandrine (7 + 7 syllables), arranged in a sequence of monorhymed quatrains; however, the presence of shorter hemistichs often brings the lines near the epic decasyllable of the jongleurs. There are four manuscripts. The one in Venice (V, Marciana Library) and the one in Seville (S, Co-lombina Library) are closely related and provide the best reading of the poems. They also feature, before each poem, a long title (Latin in V and vernacular in S) in which paradise is called a "heavenly Jerusalem" (*De Jerusalem celesti*) and hell a "hellish Babylon" (*De Babilonia infernali*). The other two manuscripts are found in Udine (U, Arcivescovile Library) and Oxford (O, Bodleian); the latter, O, contains only the first poem (*Jerusalem*). The two poems were initially published only from V by Ozanam (1850) and, more competently, by Mussafia (1864) but were finally edited from the four extant manuscripts (with critical apparatus) by Barana (1921) and again by May (1930). May's edition includes an ample commentary on Giacomino's culture and sources. The text established by Contini (1960) and R. Brogginì was the first edition based on a genealogical presentation of the manuscripts and is therefore, strictly speaking, the only critical edition available as of the present writing.

In *De Babilonia infernali* (335), the poet clearly identifies himself as "Iacomino da Verona—de l'Orden de Minori." This poem and *De Jerusalem celesti* are followed, in V and S, by five other religious poems. Mussafia was inclined to attribute these five to Giacomino as well, on the basis of linguistic (Old Veronese) and cultural (Franciscan), though not metrical, affinities. The most relevant of these poems is the one titled *Delia caducità delta vita umana*, "On the transience of human life" (Contini 1960, Vol. 1, 653–666). The question whether the selection was made to include works of the same author or simply of the same genre cannot be decided.

There has been much speculation about Giacomino's life, but little is known for sure. He was a Franciscan friar from Verona who lived in the Veneto, in a city other than his own (possibly Venice) during the mid-thirteenth century. Judging from the musical expertise he shows in *Jerusalem*, he might have been a *magister cantus* in his convent.

Giacomino represents heaven and hell as two cities; this was a quite common view during the Middle Ages, and it also turns up in the topography of Dante's *Inferno* (the city of Dis) and, at least figuratively

(as metaphors and similes), in his *Paradiso*. In this instance, however, the reference may well be to imperial Rome rather than to Jerusalem. Drawing mainly on biblical sources, Franciscan visions, and the repertoire of preachers, Giacomino produces a vivid, if naive, picture of the Christian afterlife; he also resorts to fictitious examples and comparisons in order to evoke a sense of marvel in his readers (*Jerusalem*, 165–168; *Babilonia*, 35–36). *Jerusalem* is, as one might expect, more descriptive; *Babilonia* tends to be more dramatic. In *Jerusalem*, crystal, silver, gold, and precious stones are combined with the vernal delights of the *locus amoenus* (pleasant place) in order to build up the heavenly city, from which all earthly miseries and dangers are banned. The angels and the blessed, in splendid attire, gather around the throne of God (unpretentiously visualized as Jesus Christ) and sing his praise in the most melodious way, while being directed by Jesus himself (170). At the end of the poem, particular attention is given to the glory of Mary: in a courtly vein, she is introduced as a dignified *chatelaine* surrounded by her champion knights, to whom she graciously offers fragrant wreaths, dazzling palfreys, and well-deserved coats of arms (285–316).

As an urban landscape, Giacomino's hell in *Babilonia* is the terrifying opposite of his paradise. Bronze, iron, and steel are the metals that make up its walls and even its sky. The fire is blazing, the stench unbearable. The watchmen perched on the main gate do not let any inmate escape but are eager to lay hands on newcomers. The reader discovers many of these horrors through the experience of a newly arrived sinner, and both reader and sinner are bound to be appalled by the rigor of divine justice. Swarms of hyperactive, sadistic, raving devils torture the damned with great inventiveness while making sarcastic comments about the futile laments of their victims. Two unforgettable highlights are a sinner roasted on a spit by chef Balzabu and then presented in spicy sauce to the king of hell, who predictably finds the meat only half-cooked and sends it back to the fire (117–136); and a shocking debate between a father and son who fiercely blame each other for their damnation.

Giacomino Pugliese

Nothing is known for certain about the thirteenth-century poet Giacomino Pugliese. His name appears three times as Giacomino in the Vatican Codex (Vat. Lat. 3793), but the many attempts to identify him remain unconvincing. The most persistent claim (Monti 1924) is

that our poet is identical with Iacobus de Morra, mentioned by Rolandino in his *Cronica delta Marca trevigiana*. Iacobus de Morra belonged to one of the highest-ranking families in Sicily, where his father, Enrico, was viceroy and *capitano generate* and later *gran giustiziere*; Iacobus himself served as *podestà* of Treviso in 1239, as *capitano generate* of Spoleto in 1240, and as *vicario generate* of the March of Ancona in 1245. Suspected of participation in a conspiracy against the emperor in 1246, Iacobus sought refuge with Pope Innocent IV. But although this identification was received enthusiastically by Torraca (1902) and Lazzeri (1942), among others, it has been convincingly refuted in more recent scholarship. Certain elements undermine the theory that Giacomino belonged to the highest level of the Sicilian society, notably the consistent use of the diminutive form of his name with no title such as *ser* or *messere*. Furthermore, the passage *solea avere sollazzo e gioco e riso più che null'altro cavalier che sia*—"I used to have solace and joy and merriment more than any knight in the world" (in *Morte perché*, verses 11-12)—may not necessarily be autobiographical or even imply that he was a knight. Giacomino's predilection for the light *canzonetta* genre has led some scholars to theorize that he may have been a humble *giullare* (minstrel); but this, too, is far from certain, since high-ranking *magna curia* poets such as the notary Giacomo da Lentini and Rinaldo d'Aquino did not refrain from using popular genres.

Giacomino's poetic legacy consists of eight poems, the most famous of which is *Morte perché m'hai fatta sì gran guerra*, a lament over the death of the poet's lady. Though it has been praised for its popularizing vein, this poem also reveals great technical virtuosity. Its autobiographical value is probably nil, and attempts by scholars to unravel the story of Giacomino's own amorous experience from his poems by arranging them in a certain sequence are unconvincing. Of his eight compositions, one—*Donna di voi mi lamento*—is in dialogue form. In another poem, *Quando veggio rinverdire*, Giacomino sets the poet's suffering against the backdrop of spring, a traditional troubadour inspired motif. This poem contains a series of moral reflections, ending with a concrete note, the image of the lady who gives the poet a lock of her golden hair. *La dolce cera piagente* is a song of separation. *Donna per vostro amore* is a *discordo*, showing some affinity with Giacomo da

Lentini's *Dal core mi vene*. Giacomino calls the poem a *caribo*, a mysterious word that has not been fully elucidated.

Dante makes no mention of Giacomino, and Giacomino's lyrics were slighted by early editors; not until 1875 did a complete edition of his works appear, in the D'Ancona-Comparetti anthology. Nineteenth-century critics tended to bestow excessive praise on Giacomino's poetry because of its popular characteristics and its supposed portrayal of sincere emotions.

Giacomo D'arena

The thirteenth-century jurist Giacomo d'Arena taught at Padua beginning in 1261. He also taught at Siena, Bologna, and Reggio before returning to Padua c. 1286. Next, he taught in Naples c. 1296—this is the last recorded date in his career. Giacomo wrote annotations on the *Digest* and the *Code*, as well as several legal tracts that were still in circulation late in the sixteenth century. Cino da Pistoia made use of Giacomo's glosses in his commentary on the *Code*.

Giacomo Da Lentini

Little is known about the life of the thirteenth-century poet Giacomo da Lentini. His fame as one of the most important notaries at the court of Frederick II was so firmly established that Dante refers to him simply as the *Notaro*, and in the codices Giacomo's name is usually preceded by this title; but there are surprisingly few documents testifying to his professional career. The year of his birth is unknown; but there is no room for doubt about his birthplace, since in two or three of his poems he describes himself as having been born in Lentino (*nato da Lentino*), a small locality on the eastern coast of Sicily. The documents bearing witness to his juridical activities date from 1233 and 1240. In 1233, two privileges were drawn up by the hand of Giacomo da Lentini—*per*

manus Iacobi de Lentino (or *Lintin*)—the first one in March at Policoro on the Basilicata coast, and the second in June in Catania. The formula *per manus Iacobi notarii* is encountered in a document from Palermo and in a letter from Castrogiovanni (modern-day Enna) that same year; thus we have enough evidence to show that the *Notaro* must have accompanied the emperor on a journey in March–August 1233 from Policoro via Messina and Catania to Palermo. A document issued in Messina on 5 May 1240 bears the signature *Iacobus de Lentino domini Imperatoris notarius* (Giacomo da Lentini, notary of the emperor). Nothing else is known of the biography of the founder and most famous poet of the Sicilian school, and his end is veiled in mystery.

Internal evidence is of little help in establishing a chronology for Giacomo's life. In the canzone *Ben m'è venuto prima al cor doglienza*, he compares his lady's arrogance to the pride of Milan over its *carroccio* and makes a brief reference to a feud between Florence and Pisa. Sanesi (1899) and Gaspary (1882) assumed that Giacomo must have written this passage before the battle of Cortenuova in 1237, a battle at which the Milanese suffered a humiliating defeat. Torraca (1902), however, opted for 1246–1248 as the period when these lines were composed. In 1246, the Guelf Florentines voiced their dissatisfaction with the *podestà* appointed by the emperor, and in 1248 they were defeated by the Ghibellines. Zenatti (1896) dated the war between Florence and Pisa to 1233 and Santangelo (1959) suggested the summer of 1234, but Langley (1915) considered these references too vague to be of much use in dating the poem. A reference in *La 'namoranza disiosa* to a naval encounter near Syracuse, tentatively dated to 1205 by Cesareo (1924), offers no proof of the composition date, and it remains highly unlikely that this poem could have been written during the decade 1200–1210. The period of Giacomo's most intense poetic activity probably coincided with the years of his documented professional duties at the imperial court. The episode involving Bonagiunta da Lucca in Canto 24 of Dante's *Purgatorio* (verses 55–57) confirms Giacomo's role as the chief representative of the Sicilian school, and Dante praises the poem *Madonna dir vi voglio*, though without mentioning the poet by name. Giacomo's prestige may also be inferred from the poem *Di penne di paone e d'altre assai*, in which Chiaro Davanzati accuses Bonagiunta of plagiarizing the *Notaro*. In the Vatican Codex (Vat. Lat. 3793), Giacomo

is given more prominence than any of his contemporaries: his poems are listed first in each genre section; and with some forty pieces definitively attributed to him, he far outdistances all other Sicilian poets in sheer numbers.

We have little reason to doubt that Giacomo was instrumental in choosing an Italian dialect for poetry composed in the Provençal mode in Sicily. He may also have played a decisive role in imposing a very narrow thematic orientation on the school, and he is usually credited with being the inventor of the sonnet form. Except for a single sonnet on friendship, Giacomo wrote solely on amorous themes. Most of his *canzoni* are conventional in theme and style; and his sonnets, twenty-one in all, with four more of uncertain attribution, show the same adherence to the Provençal mode. Even at this early stage in its evolution, however, the sonnet tends to become more philosophically oriented, serving as a forum for discussions of the nature and power of love. In the poem *Amor non vole ch'io clami*, Giacomo ridicules the abuse of lovers' laments, but this satirical approach is itself purely conventional and does not reveal any beginnings of disenchantment with a stereotyped motif. This poem, therefore, is not to be considered a literary manifesto. Giacomo wrote many *canzoni* or *canzonette* of great technical simplicity, but other poems of his testify to his mastery of some of the most complex metrical schemes inherited from the troubadours.

Gianni Degli Alfani

Gianni was a thirteenth-century Florentine poet of the *dolce stil nuovo*, whose poems are included in the Chigiano manuscript (L.VIII.305), one of the most prestigious collections of early Italian poetry. The poet has been identified with Gianni di Forese Alfani, who was born between 1272 and 1283 and was *gonfaloniere della giustizia* (standard-bearer of justice) in 1311. This identification would make Gianni one of the youngest poets of the *stilnuovo*. However, if the poet was the person of that name who matriculated in the silk guild in 1243 and died before 1310, he would have been considerably older than his fellow *stilnovisti*. In any case, we learn from his poetry that he traveled abroad as far as

the Danube River and that he was a political exile.

Seven poems of Gianni's have been transmitted in the Chi-giano Codex and reveal his poetic affinities with Guido Cavalcanti. In the graceful composition *Ballatetta dolente* ("Sad ballad"), Gianni speaks of Guido with great admiration: *perché egli è sol colui che vede Amor* ("because he is the only one who understands Love," verse 19). He also wrote a humorous sonnet to Cavalcanti, *Guido, quel Gianni ch' a te fu l'altrieri* ("Guido, that Gianni who greeted you yesterday"), seeking the poet's advice on love. Cavalcanti responded with a motet, *Gianni, quel Guido salute* ("Gianni, that Guido whom you greeted").

In Gianni's poetry, as in Cavalcanti's, death and fear are prominent themes, although Gianni's outlook is more optimistic. In *Ballatetta dolente*, for example, the exiled poet sends his composition to his lover in Florence; at the same time, he requests that the poem be read by Cavalcanti in the hope that it will inspire pity in him. Unlike his more renowned counterparts, Gianni does not wish to examine the origin and meaning of love, yet his stylized representations of the emotions are meant to inspire a sense of community among poets who are capable of finer feeling. That Gianni was more interested in the phenomenology of love than in its allegorical meaning can be seen in the *ballata Quanto più mi disdegni, più mi piaci* ("The more you scorn me, the more you please me"), in which the poet revels in his mistress's reluctance to reciprocate his love. Although the speaker's heart is gripped by fear, the reader senses that the speaker rejoices in, or thrills to, his lover's disdain: *una paura nel cor mi discende/cbe dentro un pianto di morte v'accende* ("a fear comes into my heart and kindles a weeping akin to death," verses 3-4). In another *ballata*, *Donne, la donna mia ha d'un disdegno* ("Lady, my lady has with her disdain"), the poet expresses sympathy for a friend who is suffering the pain of unrequited love. For Gianni Alfani, poetry was, above all, an experience binding people emotionally rather than intellectually.

Gidino Da Sommacampagna

The Veronese poet *Gidino da Sommacampagna* (fl. late fourteenth century), like his father, *Manfredo*, was in the service of the *Delia Scala* (Scaliger) family of Verona. *Gidino* was the author of an important treatise on vernacular poetry, *De li rithimi volgari* (1384), dedicated to *Antonio Scaligero*. This treatise, a popularization of *Antonio da Tempo's Summa artis rithimici vulgaris dictaminis* (1330), has come down to us in only one manuscript, the fourteenth-century codex *CCCCXLIV* of the *Biblioteca Capitolare* of Verona. Although *Scipione Maffei* in the eighteenth century and *Giulio Perticari* in the nineteenth century discussed the manuscript and the attribution to *Gidino* (whose name appears in the colophon and in an acrostic poem), the treatise was not published until 1870.

Following his model closely, *Gidino* describes seven principal genres and their numerous variations: the sonnet (which has eighteen variations); the *ballata* (*grande*, *mezzana*, *minore*, *co-mune*, *minore*, *piccola*, *minima*)-, the *canzone distesa* (of which there is only one form); the *rotondello* (of which there are at least four types); the madrigal (five forms); the *sirventese* (of which there are seven types, including one in three languages); and the *moto confetto*, which is modeled on the *frottola* but which deals with a serious theme. This first part is followed by a brief explanation of the rules governing the composition of the poetic forms. The author then gives a description of other kinds of sonnets that are based on sophisticated wordplay. He

concludes his treatise with a discussion of the *contrasto*. With the exception of one verse borrowed from Dante, Gidino draws his examples from his own poetry. His treatise, therefore, is also the primary source of his poems.

The word *rithimi* in Gidino's title is a synonym for "poem." Rarely does he discuss what modern readers would consider rhythm, that is, the visual and auditory effect created by meter and syntax. He is primarily interested in the structural features of a poem. Giuliani (1870) found in the treatise a wealth of knowledge about linguistic features of the Veneto region and about comparative philology. Modern readers should pay attention to Gidino's detailed descriptions. Besides revealing the range of poetic types, Gidino's taxonomical exposition may be interpreted as an attempt to codify poetry as an elite and artistic form of communication. As a popularization of Antonio da Tempo's Latin treatise, *De li rithimi volgari* was perhaps intended as an instructional guide to be readily shared with others. Yet it may not have circulated as widely as its form would suggest, given that it has come down to us in only one manuscript.

Giles of Rome

Giles of Rome (Egidio Romano, Aegidius Romanus, Egidio Colonna; c. 1245-1316) was an Augustinian friar and a prominent scholasdc

philosopher and theologian. He was born in Rome to a family of small landowners, but they were probably not the Colonna as is often supposed. Against his family's wishes, he entered the new mendicant order of the Hermits of Saint Augustine (founded 1256), which c. 1260 sent him to study at the University of Paris, where he became the order's first bachelor of arts (1266), doctor of theology (1285), and official theologian (1287). He probably studied under Thomas Aquinas, who certainly influenced him more than any thinker except Aristotle; and although Giles often criticized and diverged from Aquinas's teachings, he did so with marked respect. In 1277, the bishop of Paris, Etienne Tempier, condemned some of Giles's doctrines as heretical; as a result, Giles had to abandon his university career until a retraction was effected through the intervention of the pope (1285). In the interim he wrote a treatise, *On the Education of Princes*, for the future king of France, Philip IV the Fair, whose tutor he may have been. During the same period he was frequently in Italy, where he performed responsible administrative functions for his order. Eventually, in 1292, he was elected head of the order and had to resign his professorship in Paris, although he continued to live there. Then, in 1295, he was appointed archbishop of Bourges by his friend Pope Boniface VIII (r. 1294-1303), who also made him a cardinal in 1302. During Boniface's papacy, Giles spent much of his time at the papal court, where he wrote his treatise *On Ecclesiastical Power* (1302), asserting the subordination of temporal rulers to the authority of the pope. Giles's influence waned when his old rival, the archbishop of Bordeaux, became Pope Clement V (1305); he spent his later years mostly at Bourges, always writing and occasionally giving expert opinions, e.g., against the Templars and Peter John Olivi. He chose to be buried in the Augustinian convent at Paris, his spiritual home, to which he bequeathed his library.

[illegible]

Augustine, his order's eponymous patron. Giles is not quite of the first rank among scholastic thinkers, but his works have nonetheless been extensively studied (although there is as yet no complete edition of them). His career indicates the extraordinary prestige he enjoyed in his own generation as an accomplished, Paris-educated theologian.

Giotto

Giotto is the nickname of a Florentine painter or the second half of the fourteenth century. The name was first applied in the late fifteenth century to a painter, Giotto di Maestro Stefano, who has been a subject of continuing controversy concerning identification and attribution. Giotto di Maestro Stefano is documented only twice: in 1368 he was inscribed in the guild register of Florentine painters, and in 1369 he appears as one of a team of assistants, alongside Giovanni da Milano and Agnolo Gaddi, working under Giovanni Gaddi on fresco decorations (now lost) for the Vatican Palace. The profession of his father, Stefano, is unknown, though some modern scholars have

(conjecturally) associated this Stefano with Stefano Fiorentino, a pupil of Giotto who was also, according to the seventeenth-century historian Filippo Baldinucci, Giotto's grandson. If these assumptions are correct, Giotto would have been Giotto's great-grandson.

Early chroniclers, including Villani and Ghiberti, mention followers of Giotto such as Stefano and Maso di Banco but, troublesomely, make no reference to Giotto. Antonio Billi, in his *Libro*, compiled between 1481 and 1530, provided the earliest list of works attributed to Giotto. The Anonimo Maglia becchiano (c. 1540) was the first to identify Giotto as the son of Maestro Stefano. Giovanni Battista Gelli's unfinished biographies of artists (c. 1550) first conflated Giotto with Maso di Banco; Vasari (1568) finally codified the process of entanglement by writing a biography of Tommaso di Stefano, called Giotto, and attributing to him works now known to be by Maso di Banco. Here, three distinct personalities—Maso di Banco, Maestro Stefano, and Giotto himself—were melded into one; and to make matters worse, another painter of the late *Trecento* named Tommaso di Stefano may have been involved.

Today, only two works are attributed to Giotto with any unanimity. One, *Madonna and Child and Saints*, is a detached fresco, possibly from the 1350s, from a tabernacle on Via del Leone in Florence, which had probably already been removed in the eighteenth century from a tabernacle in Piazza Santo Spirito (and is now stored in the Florentine Galleries). The second, *Lamentation Over the Dead Christ*, is a panel, perhaps from the 1360s, formerly from San Remigio in Florence (and now at the Uffizi in Florence).

The problem of Giotto and his confusion with other artists would matter little were it not that these two works are of the highest quality and point to a distinct personality of great importance. The *Lamentation* shows a distinctly Florentine, Giottesque monumentality in the bulky forms arranged across the panel. However, as more recent scholarship has emphasized, attention is also given to surface naturalism and detail—as in the carefully traced windings of the Magdalene's hair, or the superb foreshortening and modeling of John the Evangelist's complex turn of posture—that seem more northern Italian in origin and were perhaps influenced by the presence in Florence of the Lombard painter Giovanni da Milano in the 1340s and

1360s. The *Lamentation* conveys a reverential, meditative stillness that may reflect the pietistic turn of the arts after the black death. Unlike the detached, iconic imagery of Orcagna, however, this panel evokes a profoundly felt pathos that goes to the core of Giotto's approach as well.

Giotto Di Bondone

Giotto (Giotto di Bondone, c. 1266-1337), a Florentine painter from Colle di Vespignano, near Florence, was the single most important figure in the redirection of the arts away from medieval stylization to Renaissance naturalism. During his lifetime, Giotto received a level of

acclaim accorded to no other medieval artist. The revolutionary aspect of his accomplishment was already understood by his contemporaries. By 1316, Dante proclaimed Giotto the most famous painter of the day in a passage (*Purgatorio*, 11.94–96) decrying the folly of pride:

*Credette Cimabue ne la pittura
tener lo campo, e ora ha Giotto il grido,
sì che la fama di colui è scura.*

(Once, Cimabue thought to hold the field/in painting; Giotto's all the rage today; / The other's fame lies in the dust concealed.") Boccaccio, in the *Decameron* (c. 1350), credited Giotto with bringing back to light a true, intellectual art, which had lain in neglect for centuries. Giotto's work continued to serve as a model for Florentine artists from the *Quattrocento* to the high Renaissance, when the young Michelangelo copied motifs from the Peruzzi Chapel in Santa Croce in Florence.

Administrative, legal, and literary documents attest to Giotto's long, prolific, and far-ranging career. Despite this, little is certainly known or agreed on about the artistic career of this master. Only a select core of work is today ascribed to Giotto with any consensus. Among these works, the Arena Chapel in Padua, decorated with frescoes as a family chapel or oratory for Enrico Scrovegni between 1302 and 1306, serves as the most secure anchor for an understanding of Giotto's style. The interior of the Arena Chapel is covered from floor to vault with an epic cycle of frescoes illustrating the redemption of humankind, leading from the lives of Joachim and Anna, Mary, and Christ to an enormous Last Judgment covering the west entrance wall.

The other major series of undisputed works are the fresco cycles for two adjacent chapels—those of the Bardi and the Peruzzi—in the Franciscan church of Santa Croce in Florence. The Bardi Chapel, immediately to the right of the high altar, features seven scenes from the life of Saint Francis; the Peruzzi Chapel, painted in *fresco secco* and now in poor condition, depicts three scenes each of the lives of saints John the Evangelist and John the Baptist, themes probably suggested by the patron's name, Giovanni Peruzzi. These two cycles are key works in any reconstruction of Giotto's career, but both lack any documentation whatsoever. The only certainty is that they postdate the cycle in the Arena Chapel and give us our best indication of Giotto's later activity.

Most of Giotto's documented works— such as his frescoes for the Lateran Palace in Rome, painted for the jubilee year of 1300; and the Navicella mosaic for the facade of old Saint Peter's in Rome (possibly 1310), Giotto's most celebrated composition in his own day—survive only in much altered fragments. His signed works, such as the Baroncelli Altarpiece (in Santa Croce, Florence; possibly 1328) and the Bologna Polyptych (in the Pinacoteca, Bologna; possibly 1332), are manifestly not products of his own hand but rather workshop assemblages probably following his designs.

Giotto's great success and fortune in his day is attested to by numerous known circumstances: the large workshop under his training, including such subsequently successful artists as Bernardo Daddi, Maso di Banco, and Taddeo Gaddi; his numerous land purchases and business transactions, recorded in various archives, including guarantees of loans and the lease of a loom for a considerable sum; and his extensive sojourns in the Italian peninsula and beyond. He went to Rome, Rimini, Padua, Naples (from 1328 to 1334; there, he was made first painter to King Robert of Anjou), Milan (where he was sent by the commune of Florence to work in the service of Duke Azzone Sforza in 1336), and possibly Avignon. Late in life Giotto was honored with appointments as head of works at Santa Reparata, the cathedral of Florence; and as chief engineer to the city of Florence, in which capacity he designed the campanile, or bell tower, of the cathedral.

Giotto di Bondone (1266-1336), *Madonna Enthroned with Child, Angels, and Saints* (Ognissanti Madonna), 1306-1310. Uffizi, Florence. Photo: © Scala/Art Resource, N.Y.

The magnitude of Giotto's accomplishment is still breathtaking. His works have a physical and psychological naturalism that seems thoroughly removed from medieval conventions of stylization and abstraction. When one compares Cimabue's Santa Croce Crucifix (1280s, Museo dell'Opera di Santa Croce, Florence), which was already quite innovative for the suppleness of its forms, with Giotto's Santa

Maria Novella Cross (1301 — . 1302, Santa Maria Novella, Florence), executed only some twenty years later, a vast gulf seems to separate the two. Cimabue's gracefully abstracted symbolic presence of Christ on the cross contrasts with the corpse depicted by Giotto—the body extended forward in space, the legs buckled under its weight, the head hanging down, and the face in a death grimace. Giotto's brutal rendering is, in fact, the first thoroughly realistic portrayal of Christ crucified in the history of Christian imagery. His *Madonna and Child Enthroned*, painted for the church of the Ognis santi in Florence (1306-1310; now in the Uffizi, Florence), advances this insistent realism even further. Through sheer volume, the Madonna conveys a commanding physical presence. Great pleats of cloth clearly articulate the massive form of the body beneath the drapery, and the angels and saints overlap one another in space as they attentively turn their gaze on the mother and child. No longer a miniature adult as in Cimabue's Santa Trinita Maestà (c. 1280, Uffizi, Florence), Giotto's Christ child has the chubby constitution of a real infant. Perhaps most compelling for the viewer's sense of communion with the divine, especially in comparison with the slightly earlier maestàs of Cimabue or Duccio, the throne in Giotto's *Madonna and Child Enthroned* truly seems to surround and sustain the great bulk of the Madonna, and to project forward believably into space. A series of steps leads logically up to the Madonna and child; the viewer is given the impression of implicit accessibility to the divine by this clear path of approach. In fact, the Ognissanti *Madonna and Child Enthroned* is ingeniously designed as a participatory work of art, for the Christ child's blessing is actuated only when viewers stand before the altarpiece, completing the circle of adoration that has been left open in order to include them. No earlier *maestà* had made the presence of the divine so persuasive, and subsequent treatments such as Duccio's great *Maestà* (1309-1311) for the high altar of the cathedral in Siena were perhaps influenced by Giotto's spatially convincing design.

Besides his volumetric and spatial constructions, Giotto manifested a genius for narrative drama; his scenes of the *Life of the Virgin and Christ* in the Arena Chapel or the *Life of Saint Francis* in the Bardi Chapel in Santa Croce display some of the canniest understanding of human nature ever set down in paint. This physical and psychological

realism is perfectly congruent with the evangelical designs of a contemporary movement: the mendicant orders, such as the Dominicans and above all the Franciscans, that earnestly sought to educate the public in the message of the faith through empathic meditation on the lives of the central protagonists of the Christian saga of salvation, especially Mary and Christ. Giotto's sponsorship chiefly by Franciscan patronage throughout his career was certainly no coincidence, for his lifelike rendering of biblical narratives was precisely the kind of physical cue the Franciscans sought to effect a union between layman and creed.

One of the most intractable problems in art history has been unraveling the mystery of Giotto's beginnings. To develop his revolution, Giotto clearly had to draw on extant sources and ideas. Most obvious is his debt to the sculptors Arnolfo di Cambio, Nicola Pisano, and Nicola's son Giovanni Pisano, whose works of the later *Duecento* are infused with a similar pursuit of monumentality, a natural outcome in the medium of sculpture. But the works of Nicola Pisano and, especially, Giovanni Pisano also indicate an interest in narrative legibility, dramatic focus, and distinct psychological states that presage Giotto's narrative studies. Certain painters of the Roman school, particularly Pietro Cavallini, point toward the volumetric buildup of forms in Giotto's painting. In addition, Giotto was influenced by artists who had previously absorbed his lessons. The complex architectural skyline that serves as the backdrop for the *Raising of Drusiana* in the Peruzzi Chapel, for example, is preceded by the intricate cityscape of the *Entry into Jerusalem* from the rear of Duccio's *Maesta*. The legend of Giotto's tutelage under Cimabue, first set down in a late *Trecento* commentary on the *Divine Comedy* and picked up by Lorenzo Ghiberti (*Commentarii*, c. 1450), is difficult to comprehend as a logical stylistic progression. Especially controversial is Giotto's presumed authorship as a young master of a great portion of the frescoes in the nave of the upper basilica at Assisi, particularly two well-preserved Old Testament scenes—*Isaac Blessing Jacob* and *Isaac Rejecting Esau*—and the bulk of *Scenes of the Life of Saints Francis*, probably painted in the 1280s-1290s. Through the nineteenth century, these frescoes were considered Giotto's, virtually without question; but later a growing coterie of scholars, including Richard Offner and Millard Meiss, found it difficult

to see them as congruent with the body of Giotto's work—although it should be noted that other scholars (such as Cesare Gnudi and Luciano Bellosi) believe that no comprehension of Giotto's style is possible without them. The frescoes in Assisi serve as a fascinating test case for paradigms of artistic formation and development, since different attributions and chronologies lead naturally to wholly different conclusions about the artist.

Giotto's style was so persuasive that, once it had been introduced, it spread like wildfire in any center which was exposed to his idiom. Thus Padua, Rimini, Rome, Naples, and especially Florence had successive generations of Giottesque painters. Despite the popularity of his approach, however, only a few artists, including Maso di Banco and the Lorenzetti brothers, understood the profound implications of his spatial narratives. Partly as a result of a change in outlook and patronage brought about by the black death, it took the greater part of a century for another artist to appear who comprehended the real potential of Giotto's vision. It was Masaccio, in the 1420s in Florence, who effected a return once and for all to the grave and monumental sobriety of Giotto's approach in painting.

Giovanni Balbi Da Genova

Giovanni Balbi (Johannes Balbus, d. 1298) was born in Genoa and seems to have spent much if not all of his life there. Sometime before 1272, when he was already of an advanced age, he entered the Dominican order. His name is listed in a Dominican document dated 12 October 1277. His major work, the *Catholicon*, was completed in March

Much of what we know of Giovanni Balbi's life derives from the *Catholicon*, although there are not enough biographical references to reconstruct it in detail. In this text he also makes reference, under the entry *Ianua* ("Entrance") to two earlier writings: *Dialogus de quaestionibus animae ad spiritum*, a *summa* in nine books that relies heavily on Thomas Aquinas; and *Opus paschale*, which provides a set of tables for determining the date of Easter. *Dialogus*, completed in 1272, was discovered by M. Grabmann in a manuscript at the Vatican Library. *Opus paschale* seems to have been lost, but it may have been added to the end of the *Catholicon* by the author himself. Powitz (1988) has found three manuscripts of the *Catholicon* that contain the table, which calculates the date for Easter over a cycle of 532 years, from 1286 to 1817. Balbi may also be the author of a commentary on the four gospels, a manuscript copy of which is located in the library of the Dominican convent in Genoa. The fact that this work is not mentioned under the entry *Ianua* suggests that it may have been composed later than the *Catholicon*. The attribution of *Postilla super Iohannem* and of *Tractatus de omnipotentia Dei* to Balbi appears to be entirely arbitrary.

Balbi's most important work is without doubt *Catholicon seu Summa prosodiae* (also known as *Summa quae vocatur Catholicon*), a vast treatise devoted to the arts of the trivium, on which he worked for many years and completed at the convent. It is divided into five parts: the first treats orthography; the second, placement of accent; the third, etymology, derivations, and syntax; the fourth, improprieties in discourse and rhetorical figures; and the fifth, prosody. The fifth and last part, which is much longer than the first four combined, takes as its subject not only prosody but also orthography, etymology, and semantics; and it includes an extremely useful glossary, arranged in alphabetical order. This work alone places Giovanni Balbi among the leading lexicographers of the Middle Ages, together with Papia and Uguccone of Pisa. The original manuscript appears to have contained two additional items in the form of an appendix, separate from the volume, both now missing from most of the manuscripts. The first concerns *Ciclus Paschalis*, and the second refers to *Rubricae quintae partis*.

For the composition of his treatise, Giovanni Balm made use of

ancient grammars (those of Donatus and Priscian) and the work of medieval grammarians (Isidore of Seville, Papia, Ugucione, *Grecismus*, *Doctrinale*, *Aurora*, Pietro da Isolella, and Bene da Firenze) as well as excerpts from patristic writings (in particular Jerome, Augustine, Ambrose, and Gregory the Great) and theologians (Rabanus Maurus, Bernard of Clairvaux, Albert the Great, and Thomas Aquinas). Occasional references to classical literature (chiefly Horace and Ovid) may be found, they but are infrequent, as one would expect.

With 670,000 words, the *Catholicon* is, among medieval lexicons, the largest and most complete. That fact explains the extraordinary esteem in which it was held in ecclesiastical institutions, as numerous Italian, French, and German codices and incunabula attest; humanists like Petrarch and Boccaccio also made use of it. It was, in fact, one of the first works to be printed, in 1460, perhaps by Gutenberg himself.

Giovanni Da Cascia

Giovanni da Cascia (Giovanni da Firenze, first half of the fourteenth century) was a member of the first generation of Italian *Trecento* musicians. There is little firm information about his life, but his surname suggests that he came from the town of Cascia near Florence (not in Umbria, as has sometimes been assumed). There are references that might possibly connect him to activities at Santa Trinita and the cathedral in Florence, but it would seem that he never became a priest. He is thought to have spent some time at the Visconti court in Milan, and there is a firm report by Giovanni Villani of his presence at the court of Mastino II della Scala (d. 1351) in Verona, where he was said to have competed in composition with his younger contemporary, the great Jacopo da Bologna; Maestro Piero may also have been involved in these encounters. Giovanni's music circulated widely, and he is reputed to have been the first of the Italian *Trecento* composers to win broad recognition.

Only nineteen compositions by Giovanni da Cascia survive. They are in a number of manuscript sources, most notably in the great Squarcialupi Codex, in which he is the earliest composer represented and, apparently, his portrait is included. None of his reported monophonic *ballate* have come down to us, but there are three three-voice *cacce* and sixteen madrigals. Giovanni was particularly important in defining madrigal settings as a musical form. To that form he brought carefully controlled elements of imitative part-writing, but his vocal style also balanced declamation with much-admired melodic felicity. All this served to win his music great praise in its day and guarantee it continued vitality in our own time.

Giovanni Da Faenza

Giovanni da Faenza (Johannes Faventinus, d. 1187) taught canon law in Bologna during the second half of the twelfth century. Favoring a cause unpopular in the city, he was proimperial. Local resistance to the power of Frederick I Barbarossa led Giovanni to give up teaching and instead occupy a canon's stall in his home city, Faenza, until his death. Giovanni once was confused with the bishop Giovanni of Faenza who died in 1191. Giovanni wrote a *Summa* on the *Decretum* of Gratian, summarizing the teachings of Stephan of Tournai and Rufinus of Aquileia. Bernardo da Pavia was among his students.

Giovanni Da Legnano

Giovanni da Legnano (d. 1383), a Milanese, studied in Bologna with Paulus de Liazariis. He was promoted to doctor of both canon and civil law, c. 1350; and until his death he usually taught at the University of Bologna. Giovanni had powerful friends among the clergy, and his support of the policies of Gregory XI led to his becoming papal vicar for temporal affairs in Bologna in 1377. His legal opinions on the origins of the Great Schism supported the legitimacy of Urban VI, drawing responses from the partisans of Clement VII. Giovanni's commentaries and treatises included a work on the law of war; he has therefore been regarded by some scholars as a precursor of international law. He studied medicine and astrology in his youth, and he wrote on theological and astronomical topics. Giovanni's leading student, Francesco Zabarella, thought that his master studied too many things at once, thereby depriving his legal writings of the necessary depth.

Giovanni Da Milano

The fourteenth-century painter Giovanni da Milano came from a village in the region near Como. The earliest record of Giovanni is a Florentine archival document of October 1346; presumably he was an apprentice or assistant at the time. There is no mention of him from 1346 until sometime between 1358 and 1363, when he joined the painters' guild in Florence. A signed polyptych in the museum at Prato, painted for the Ospedale della Misericordia there, was probably completed by 1363, when its commissioner died. In May 1365, Giovanni was granted an extension until November to complete his frescoes in the Guidalotti (now Rinuccini) Chapel in Santa Croce in Florence. A signed Pietà in the Accademia at Florence is dated 1365. Giovanni became a citizen of Florence in April 1366. In 1369 he was in the Vatican Palace, working on the decoration, now lost, of two chapels commissioned by Pope Urban V. It is assumed that Giovanni died soon afterward, as his name appears in no subsequent documents.

Giovanni's most important surviving works, in addition to those mentioned above, are an *ancona* (altarpiece, now in the National Gallery in Rome); a Pietà or Vesperbild (formerly in the Le Roy collection in Paris and now in the du Luart collection there); a dismembered polyptych, the central panel of the Madonna and Child recently discovered at San Bartolo in Tuto at Scandicci near Florence, and two saints (one in the Louvre and the other in the Kress Collection in Williamstown, Massachusetts); panels in the London National Gallery, the Brera in Milan (formerly Contini-Bonacossi collection, Florence), the Pinacoteca Sabauda in Turin, and the Bacri collection in Paris (formerly belonging to the duke of Sutherland), which, according to one hypothesis, come from the same polyptych; and five compartments of a dismembered polyptych (now in the Uffizi),

probably once on the high altar of the church of the Ognissanti in Florence. Although none of these works or the few additional surviving ones by Giovanni is signed or documented, scholars are virtually unanimous in attributing them to him. There is far less consensus on their dating, which must be done by comparative stylistic analysis. The *ancona* in Rome is generally considered the artist's earliest surviving work and is dated to the early to mid-1350s. The others fall approximately in the order in which they have been listed above.

It is not known to what extent Giovanni da Milano's style had been determined by the time of his arrival in Florence. The principal styles that formed his art—those of Giotto and Simone Martini—had appeared in Lombardy during the first half of the century. Their manifestations were at that time quite provincial, however, and were not able to dominate local styles. Not until the 1360s did an advanced, fundamentally Tuscan manner govern fresco painting in and around Milan, and the artists, whose names are unknown today, were influenced by Giovanni da Milano—not the other way around. Severe archival losses and what we must presume to be the disappearance of a substantial number of panel paintings make it difficult to do much more than speculate concerning Giovanni's Lombard origins. Similarly, although Giovanni clearly influenced Lombard fresco painting in the 1360s and later, and although he had a profound impact on the important school of manuscript illumination in the region during the last quarter of the century, it is unknown precisely how or when the influence was transmitted. It is often supposed that he returned to Lombardy sometime during the long period between 1346 and the next mention of him in Florence.

The identity of Giovanni's master has been a subject of much speculation. Perhaps Giovanni was trained in Florence in the workshop of Bernardo Daddi, about the same time as Giusto de' Menabuoi, a Florentine painter who worked in Milan in the third quarter of the century and affected its artistic development. Daddi's style, like Giovanni's, was compounded of Giottesque and Siennese sources, and Giovanni's early works bear a general resemblance to Daddi's. At the same time, it is apparent that Giovanni was influenced directly by the art of Siena; this is perhaps most noticeable in the *du Luart Pietà* or *Vesperbild*, which is *Simonesque* in style and probably Siennese in

iconographic origin.

Also characteristic of Giovanni's style is an anatomic naturalism highly developed for its time, seen particularly in his numerous renditions of the dead Christ. His anatomic realism, softly graduated modeling of flesh tones, and close observation of nature in general may be attributed to his northern origins but go far beyond the work of his Lombard predecessors.

Giovanni da Milano (fl. 1346–1369), *Pietà*, 1365. Oil on panel, 43 1/4 by 18 1/8 inches. Accademia, Florence. Photo: © Scala/Art Resource, N.Y.

Giovanni is sometimes treated as an exponent of an essentially anti-Giottesque tendency in Florentine painting during the third quarter of the fourteenth century, which interrupted the progression from Giotto

to Masaccio and the early Renaissance. In fact, though, Giovanni da Milano adhered to Giottesque principles more closely than any other painter active in Florence at the time. This is evident above all from the frescoes of the story of the Virgin and her parents and the life of Christ in the Rinuccini Chapel. They express a profound human dignity, achieved in part by the monumental scale of the figures. The concentrated selection and the perfection and idealization of natural appearance also demonstrate a deep understanding of Giotto's fundamental accomplishment.

Despite being arguably the outstanding painter of his generation working in Florence, Giovanni had little influence on Florentine art. This was surely because painting in Florence had drifted too far from the norm of Giotto. Giovanni's influence was greatest in his native Lombardy, and it helped to nurture the international Gothic style, which in turn reinvigorated Italian painting in the opening years of the fifteenth century.

Giovanni De Matociis

Giovanni de Matociis (Mansionario, last quarter of the thirteenth century-December 1337) was born in Verona, the son of Costantino de Matociis. Giovanni was a canon of the cathedral in Verona and also an imperial notary, like his contemporary Benzo d'Alessandria. Giovanni's role in the cathedral chapter— master of song—gave him the title Mansionario, by which he is most frequently known. His great good fortune was to have at his disposal the bountiful treasures of the capitular library of Verona, with its trove of Carolingian manuscripts. Again like Benzo, Giovanni made liberal use of these manuscripts in the studies he pursued in the wake of Vincent of Beauvais, the thirteenth-century French Dominican encyclopedist.

American classicists are familiar with one of Giovanni's achievements, the disentangling of the personalities and works of Pliny the Elder and Pliny the Younger (Merrill 1910). There is currently no edition of Giovanni's major work, *Historia imperialis* (*Imperial History*), a biographical history of Roman emperors from Caesar to Louis the Pious. There are three manuscripts of this work, one in the same capitular library where Giovanni labored and two in Rome (one in the Vallicelliana, the other in the Chigi collection of the Vatican): i.e., Verona, Biblioteca Capitolare, Cod. 204; Rome, Biblioteca Vaticelliana, Cod. D 13; and Rome, Biblioteca Vaticana, Cod. Chigi I VII 259.

Giovanni Del Biondo

The painter Giovanni del Biondo (c. 1330s-c. 1398 or 1399) was a native of the Casentino and worked for most of his adult life in Florence. Giovanni appears to have been extremely popular between 1360 and 1385. He received commissions from the most important institutions in the city and produced an extensive and eclectic group of devotional pictures.

Giovanni del Biondo (fl. 1356-1399), *Presentation in the Temple*. Accademia, Florence. Photo: © Scala/Art Resource, N.Y.

Although we know nothing of his origins, archival evidence allows us to reconstruct Giovanni's activity from 1356 until his death sometime before 1399. After a six-month stay in Florence, Giovanni petitioned the government for citizenship. Evidently, this request was granted, for tax records indicate that he lived in the quarter of Santa Croce from 1359 to 1375. He moved to the Vaio district of San Giovanni in 1376, where he remained for the rest of his life. Two entries in the *Prestanze* indicate that he had died by May 1399, and perhaps as early as October 1398.

Giovanni seems to have worked initially in the circle of Nardo di Cione. Giovanni's hand may be seen in the frescoes of the church fathers, probably executed between 1356 and 1357, in the vault at the entrance to the Strozzi Chapel in Santa Maria Novella. This period coincides with Giovanni's arrival in Florence and suggests that he joined Nardo's workshop c. 1356.

Giovanni's work in the Strozzi Chapel marked the beginning of a successful career. In 1360 he painted and signed a polyptych (now lost) for the church of San Francesco in Castelfiorentino. In 1363 he produced for the Camaldoli order at Santa Maria degli Angeli an altarpiece containing lateral images of the church fathers (today it stands atop the high altar of Santa Croce). In the following year he painted a second altarpiece for the Angeli, a small triptych of the Presentation (currently in the Florentine Accademia). Sometime during the early 1370s he completed a dossal panel representing John the Baptist. He signed another picture of the Madonna in 1377. In 1379 he executed the altarpiece for the Rinuccini chapel in the sacristy of Santa Croce. In 1385 he was selected by the Dominicans to paint an Annunciation of the Virgin for the sacristy of Santa Maria Novella. In 1392 he completed a panel for the monastery of San Francesco in Figline, and in 1396 he painted miniatures in antiphonaries made by the monks in Santa Maria degli Angeli. He also executed works for the church of Or San Michele, the Duomo of Florence, and (probably) the Badia. Few painters of his day managed to place so many works in such a diverse group of ecclesiastical institutions.

Despite his popularity, few modern critics have included Giovanni del Biondo among the great masters of the Florentine *Trecento*. His style is largely derivative, and in most of his work his debt to the Cione

brothers is clearly evident. Indeed, Ghiberti and Vasari considered his contributions negligible enough to be omitted from their critical histories of Italian art. Giovanni seems to have been pushed to the margins of art history by 1450, and his reputation has not been rehabilitated by modern historians.

Although he has never received much acclaim, there can be no question that Giovanni del Biondo was extremely popular with his contemporaries. He was in constant demand throughout his career, and his works were installed in the most important spaces in Florence. Modern viewers may not see in his work the same qualities that were appreciated by his peers, but his popularity serves as an indicator of both the taste of *Trecento* Florence and his own ability to satisfy his customers.

Giovanni Del Virgilio

Giovanni del Virgilio (fourteenth century) became famous as a professor of classical poetry at Bologna in the 1320s. His life and career were connected with those of two of his contemporaries, the Paduan protohumanist Albertino Mussato (1261-1329) and the Florentine poet Dante Alighieri (1265-1321). Giovanni was given the name Virgilio in reference to his pedagogical and scholarly devotion to the Roman poet Virgil. He was formally hired by the University of Bologna in 1321 to lecture on Virgil, Statius, Ovid, and Lucan, but he had already been teaching there in some capacity before that date. He appears to have spent the years 1324-1325 in Cesena, where he probably composed an eclogue to Mussato. After 1327 we lose all record of him.

Giovanni's fame rests primarily on his correspondence in Latin hexameters with Dante in 1319-1320 and the epitaph he composed for Dante's tomb that was recorded by Boccaccio in his life of Dante. The correspondence has come down to us in the Laurentian Library manuscript 29.8, which was owned and possibly copied by Boccaccio. This manuscript also contains the longer eclogue to Mussato, two other verse epistles, and part of an epic poem about a besieged city and the conquered queen's pleas for mercy. This last fragment reflects Giovanni's proto-humanist Virgilian mind-set, which rather pedantically deemed great literature the eloquent account in Latin hexameters of a contemporary political or military event. This is the source of Giovanni's dismay at Dante's choice of argument and vernacular expression—a dismay that prompted Giovanni to initiate the Latin correspondence. In the first epistle, Giovanni suggests worthy matter from contemporary Italian history for a proper Latin opus: the tragic drama of the late Holy Roman emperor Henry VII in his struggles in Italy; the recent aggression by Uguccione della Faggiuola in Tuscany; the victories of the imperial vicar Cangrande della Scala (Dante's esteemed patron and the dedicatee of *Paradiso*, and Mussato's nemesis) against Padua. Giovanni chastises Dante for wasting his talent by trying to bring serious themes to the vulgar herd (*seria vulgo*). Ever the professor, Giovanni begs of Dante something worthy of academic study. He offers to place the coveted laurel crown, the ancient sign of literary glory, on Dante's brow in triumphant celebration amid the scholars of Bologna.

Dante satisfies his request, though not without some degree of ironic

—perhaps even affectionately mocking—play. Dante had already been resident for some years in Ravenna at the court of Guido Novello da Polenta when he received the missive from Bologna. He takes up Giovanni's classical challenge by reviving the highly stylized conventions of the eclogue or pastoral poem, usually a dialogue among shepherds in a prelapsarian fantasy land. Virgil had written ten. Thus Dante casts himself as Tityrus, his friend and fellow exile Dino Parini as Meliboeus, and Giovanni as Mopsus. Within this elaborate code, Dante explains that he should defer the poetic coronation until he has completed *Paradiso* and hopes even then to be celebrated in his native Florence. Hoping to improve Giovanni's opinion of his vernacular verse, Dante announces that he will send along "ten bottles" (*decern vascula*) of milk from a segregated, much-loved sheep of his flock (*ovis gratissima*), as yet un milked and on the verge of bursting (*ubera vix quae ferre potest, tarn lactis abundans*). Some critics take this as a reference to ten cantos of *Paradiso*, a significant confirmation that the poem was circulating in part before its completion.

In response, Giovanni delights in taking up the pastoral fiction and returns a work strongly dependent on Virgil's second eclogue, in which the shepherd Corydon sings his love for the beautiful young boy Alexis. At the end of Virgil's poem, Corydon threatens to find himself "another Alexis" (*alienum Alexim*) should his affections continue to be scorned. Giovanni's eclogue professes his admiration and love for Dante, sympathizes with Dante's desire to be celebrated in Florence, but implores him nonetheless to visit Bologna, where an alluring pastoral idyll awaits ("Alexis shall spread wild thyme to be thy couch ..."). Finally, Giovanni warns that should Dante scorn him, he will "quench his thirst at the Phrygian Musone," a reference to Padua's river and to Mussato, Dante's poetic rival. Curiously (for us), Giovanni appears to have considered Mussato the greater poet: Mussato had, after all, composed his epic *Ecerinis* on the cruel tyranny of Ezzelino in Padua and had accordingly been crowned poet laureate in 1315, a distinction which neither Dante nor Giovanni had achieved and which inspired awe in Giovanni at least.

The response from Dante apparently reached Giovanni in Bologna only after Dante's death. In this enigmatic final eclogue, Dante relates that he would visit Bologna were it not for his fear of a certain

"Polyphemus," whose precise identity remains a mystery. In his (never inscribed) epitaph for Dante's tomb, Giovanni lauds him as theologian, philosopher, and "glory of the muses, most-loved author of the common people" (*gloria musarum, vulgo gratissimus auctor*), who wrote in both Latin and the vernacular (*laicis rhetoricisque modis*). Of Dante's works, Giovanni singles out for mention the *Comedy*, *Monarchia*, and, appropriately, the series of eclogues interrupted by his death.

Giovanni was also the author of a verse epistle known as *Diaffonus* and several pedagogical works: commentaries on Virgil's *Georgica* and Ovid and a brief *ars dictaminis*.

Giovanni Di Piano Carpini

Giovanni (c. 1180-1252) was born at Pian di Carpini (Piano della Magione) in Umbria and was a first-generation Franciscan, from c. 1220. He served as a provincial official in Germany, Spain, and possibly Barbary. His fame, however, rests on his mission to the court of the Mongol khan.

Pope Innocent IV chose Giovanni and two other friars to act as emissaries to protest against the Mongols' expansion into Christian Europe, perhaps to gain aid against militant Islam, and to observe the Mongols closely. The party departed from Lyon in April 1245 and arrived at Karakorum on 22 July 1246. The new khan, Kuyuk (enthroned on 24 August) promised nothing and made no concessions, dismissing the envoys in November. After a hard winter's journey they arrived in Kiev in June 1247, and they were with the pope in Lyon seventeen months later. The pope made Giovanni bishop of Antivari (Dalmatia) in 1248; but after a dispute over the see Giovanni returned to Italy, where he died, near Perugia, on 1 August 1252.

Giovanni's *Historia Mongolorum* (*Mongol History*), or *Liber Tatarorum* (*Book of the Tartars*), constitutes his official report on the mission. It is a generally reliable discussion of the territories traversed and the peoples encountered. Although it was not published in full until the nineteenth century, it circulated in Europe and was used by, among others, Vincent of Beauvais (*Speculum Historiale*, c. 1260) and Roger Bacon (*Opus maius*, c. 1266).

Giovanni Gualberto, Saint

Giovanni (c. 995-7 December 1073) was a monastic, a church reformer, and the founder of the Vallombrosian order. He was perhaps born into the noble Visdomini family of Florence. He turned to the religious life after a dramatic confrontation with a kinsman's killer. It was Good Friday, a traditional day of reconciliation, and the man rushed up to beg forgiveness. Suddenly overwhelmed by the futility of vengeance and violence, Giovanni not only pardoned the killer but decided to become a Benedictine monk. He professed at the nearby monastery of San Miniato, but he soon began to criticize its lax observance of the Benedictine rule and the simoniacal appointment of its abbot. Sometime before 1027, he left San Miniato for the famous hermitage at Camaldoli established by Romuald of Ravenna. Here too Giovanni was dissatisfied, though; he felt that the Camaldoli rule strayed from traditional Benedictine practice by limiting its monks' preaching in nearby towns. He finally withdrew to Vallombrosa, a wooded area on the western side of the Pratomagno hills, where he founded his own monastery c. 1038. To ensure that this house kept the Benedictine rule strictly, he introduced lay brothers—professed monks who did not pursue the eremitical contemplation of the rest of the community and were not bound by the vow of silence—to act as buffers against the outside world. Their function in the monastery was to attend to all business and administrative concerns, leaving the other monks free to focus on spiritual development.

Within a few years, Vallombrosa gained a local reputation for holiness. Several other Tuscan monasteries placed themselves under the authority of its abbot, following the example of Cluny. Vallombrosa soon began to found new communities, usually hospices for the poor

and sick, which were also kept under the authority of the abbot. By the late eleventh century, Vallombrosa headed a small congregation of monasteries located primarily in Italy. The congregation never grew very large, but its innovations—an emphasis on the literal observance of the Benedictine rule and the use of lay brothers to free the monks from mundane concerns—were adopted by the founders of the Cistercian order in the early twelfth century.

Giovanni's hatred of simony drew him into the contemporary movement for church reform. In the 1060s, he and his monks engaged in a fierce struggle to unseat the simoniacal bishop of Florence, Pietro Mezzabarba. Mezzabarba was eventually forced to flee the city, and Giovanni's faction saw one of its leaders, Pietro Igneo, elevated to the cardinalate. By the end of the 1060s, Giovanni had become an important opponent of simony in northern Italy, sending his monks as far as Milan to implement reform. Giovanni Gualberto was canonized in 1193.

Giraut de Borneilh (c. 1166-c. 1211) was born at the border between the Limousin and Périgord near Excideuil. Recent scholarship has provided his approximate dates, and allusions in his poetry situate his literary activity between c. 1180 and 1210. Giraut must have received a sound education at an abbey before going as a clerk to the court of Raimbaut d'Orange, who became his friend. From Raimbaut, Giraut learned to compose *trobar leu* ("light") or *trobar clus* ("serious") poems, according to the circumstances, his audience, and the topic. Having become an accomplished and recognized poet, he went to King Alphonse II of Aragon, whom he served for a long time, except for the years 1188–1189, when he followed the Limousin barons in the crusade of their overlord Richard Coeur de Lion (Lion-Heart). In 1192, Giraut left Aragon and retired to Nôtre-Dame de Dalon, an abbey in the Limousin (as did Bernart de Ventadorn and Bertran de Born).

Seventy-six of Giraut's poems, including four with their melodies, are preserved, mostly *cansos* but also some *sirventes* (poems of blame), *pastorelas*, and *planhs* as well as a beautiful *alba* (dawn song). Giraut was above all a scholar and thus earned the appellation *maestre dels trobadors* (master of troubadours). In his works, he delights in subtle dissertations; and his dignity of attitude and attention to form reveal his high concept of art. His poetry has the solemn tone of a moralist and sometimes a certain dryness; even when he sings about love, his sentiment appears more like a means of elevation and a call to virtue. Despite his desire that his poems be clear and without affectation, he is as difficult in *trobar leu* as in *trobar clus*. Dante, in *De vulgari eloquentia* (2.vi. 6), admires Giraut's *illustres cantiones*, but in Canto 26 of *Purgatorio* (v. 120) he calls Giraut *quel di Lemosì* ("that one of Limousin") and judges him inferior to Arnaut Daniel.

Giullari

The *giullari* (singular, *giullare*) were jongleurs, or minstrels. They fulfilled the function of communicators *par excellence* in Italy, as elsewhere in medieval Europe—a world where communication rested on oral transmission. They were the ones who told or sang about characters and events, filtering and coloring the tales. This accounts for the favor that lords and authorities extended to the *giullari*, despite the church's repeated warnings against them. More specifically, the jongleur was a specialist in entertainment, whose performance combined music, words, and physical appearance and gestures in order to please his public. His skills might comprise singing, dancing, acrobatics, storytelling, and comedy. The main occasions for performances by jongleurs were weddings, knighthood ceremonies, banquets, and numerous civic festivities. Often, the jongleurs performed at regular intervals (e.g., every Sunday), in preselected city venues. Sometimes a jongleur would spend a long period of time in the service of a lord; but it seems that vagrancy was an integral part of the jongleurs' way of life.

A passage by Giovanni Boccaccio offers interesting testimony to the perception of the jongleur in fourteenth-century Italian communal society:

In former times, their function usually consisted, and all their efforts were expended, in making peace whenever disputes or conflicts arose between two nobles, negotiating treaties of marriage, friendship or alliance, restoring tired minds and amusing the courts with fine and graceful witticisms, and censuring the failings of miscreants with pungent, fatherly strictures, all of which they would do for the slenderest of rewards. Whereas nowadays they spend the whole of their time in exchanging scandal with each other, sowing discord, describing acts of lewdness and ribaldry, or worse still, practicing them in the presence of gentlemen. Or else they will justly or falsely accuse one another of wicked, disgusting and disreputable conduct, and entice noble spirits with false endearments to do what is evil and sinful."

(*Decameron*, 1.8, trans. G. H. McWilliam).

Boccaccio idealizes the jongleurs of earlier times, perhaps on the basis of literary suggestions, and stresses their baseness in the real world of his own day. In fact, communal statutes are surprisingly harsh in dealing with jongleurs, who are often mentioned together with prostitutes and are denied even the right to bodily integrity. The statutes of Ivrea (1237), for example, allowed citizens offended by a jongleur (*meretrix vel ribaldus, jocularator vel jocularitrix, saglobator vel saglobatrix, furiosus vel mentecaptus*) to beat him until he bled (*verberare usque ad effusionem sanguinis*).

Thomas of Chabham (or Cobham), in *Summa confessorum* (*Penitential*), provided an authoritative and balanced judgment on the moral worth of this figure by identifying different types within the general category of jongleurs. Those who change their appearance with "horrid" masks and deform their bodies with shameful gestures are definitely guilty, as are those who wander from court to court and please their public by slandering the absent. Those who play musical instruments to please their audience are blameworthy if they attend drunken revelries and perform songs that induce lust. Finally, there are jongleurs who sing the deeds of princes and the lives of saints and bring relief to people stricken by sickness and melancholy; these

jongleurs may be remunerated without sin.

In the Italian language, various terms are used for a jongleur, suggesting that this figure was multifaceted. The term *buffone* is found in a poem by the Provençal Guiraut Riquier, who distinguishes between the *trobador* (a composer of poetry and music), *juglar* (a mere singer of songs composed by someone else), and *bufo* (a mime and entertainer, held in the lowest esteem). The term *giocolare*, from the Latin *jocularis*, points to the playfulness of the jongleur's activity (*jocus*). *Joglar*, the Provençal form of this word, is the origin of the modern term *giullare*. A term often used in Italian documents, *uomo* or *cavaliere di corte* (*miles curialis*), indicates the milieu in which the jongleurs most often performed. Starting c. mid-fourteenth century, communal governments—particularly in Perugia and Florence—appear to have hired a more or less permanent jongleur to enhance the quality of life of their *podestà*, *signori*, or both. By then, the term that more often appears in documents is *canterino* (singer).

The importance of the jongleur in the production and diffusion of vernacular poetry can hardly be overestimated. Many of the earliest documents of Italian literature belong to the jongleurs' repertoire. Jongleurs also spread French epic, romantic, and *fabliau* literature in Italy. They were responsible for thirteenth-century Franco-Italian literature and, from the mid-fourteenth century on, for the distinctive genre of *cantari* that prepared the way for the epic poems of Boiardo and Ariosto.

Giunta of Pisa

The painter Giunta of Pisa (Giunta Pisano, Giunta di Capitino; fl. 1236-1254, or possibly 1266) is considered one of the greatest artistic personalities of the early *Duecento*. His reputation rests principally on the emotive power and tragic grandeur of his painted Crucifixes, of which three signed examples survive: Assisi, Santa Maria degli Angeli; Bologna, San Domenico; Pisa, Museo Nazionale, from the church of San Ranierino. A fourth, which disappeared in the seventeenth century, was executed for San Francesco in Assisi; it carried the date 1236, in an inscription indicating that the patron was Brother Elias, minister general of the Friars Minor (Franciscans) and founder of the basilica of Saint Francis. Circumstantial evidence suggests that Giunta was also active in 1239 in Rome, where his pupil Giovanni Pisano and his son, the priest Leopardo, are also recorded. The last secure reference to Giunta is in 1254 in Pisa, although it is possible that he was still alive in 1266, when a painter of the same name is mentioned as a landowner.

Recent critical opinion has challenged the accepted chronology and stylistic development of the signed Crucifixes and has extended Giunta's known oeuvre. It is generally agreed that the Assisi Crucifix (1220s- 1230s), characterized by a pathetic humanity in tune with Franciscan spirituality, is his earliest surviving work. There is less certainty, however, about subsequent developments in his career. Some scholars argue that the San Domenico Crucifix, which reflects a greater sense of elegance and refinement, is a late work; but others prefer to place the San Ranierino Crucifix, which is controlled by a firmer sense of proportion and a softer modeling of the forms, at the end of Giunta's life. In any case, Giunta's debt to Byzantine painting techniques is evident in all his accepted work; and, as the style of the San Ranierino

Crucifix in particular suggests, he probably also came into contact with the classical revival in Byzantine art of the 1240s.

Giunta was evidently one of the most sought-after artists of his day, as his surviving work for the important shrines of Saint Francis in Assisi and Saint Dominic in Bologna attests. His expressive designs of a suffering Christ had far-reaching consequences and were assimilated by painters of the mid-century in Pisa, Bologna, and Assisi, as well as by Cimabue at its close.

Giuntino Lanfredi

The comic poet Giuntino (fl. early fourteenth century) came from an old and noble family of Lucca. He wrote two sonnets that testify to the

popularity and influence of Cecco Angiolieri. In *Vento a levante e di meridiana* ("Wind from the east and from the south"), the narrator depicts himself as a paradigm of adversity, using rhetorical techniques and a theme dear to Angiolieri. *Morte dogliosa, ché non vien' di botto* ("Sorrowful Death, why do you not come quickly"), a sonnet in dialogue between the poet-narrator and a personification of death, is a parody of serious love lyrics in which poets invoked Death to end their amatory suffering. The ironic (and Angiolieresque) twist in Giuntino's poem is that Death refuses to approach the narrator, whose poverty has frightened everyone, including Death, away.

Giusto De' Menabuoi

Giusto de' Menabuoi (fl. fourteenth century) was a northern Italian painter. The earliest secure record of him is a dismembered polyptych signed and dated March 1363, of Milanese provenance (parts of this polyptych are now in the Kress Collection at the University of Georgia at Athens). A signed and dated tabernacle of 1367 (now in the National Gallery, London) was also painted in Milan, according to its inscription. Some frescoes in and near Milan may be attributed to Giusto on the

basis of their style. The most significant of these are in the tribune of the Abbazia di San Pietro at Viboldone. A Madonna and Child with saints and donor bears the date 1349; if the attribution is correct, this would be the artist's earliest surviving work. The Last Judgment on the three other walls of the tribune was done by Giusto after an interval of at least five years. No documents mentioning Giusto have been found in the Milanese archives, and none dealing with his origins in Florence has yet come to light.

That Giusto was born and trained in Florence is evident from his style and from documents in the Paduan archives. He is first documented in Padua in September 1373, but some frescoes in the church of the Eremitani in that city may be attributed to him and dated c. 1370. Sometime after 1367, when he painted the tabernacle that is now in London, Giusto transferred his activities to Padua. From the time of his arrival there until the end of his career, he worked for the powerful and ambitious lord of Padua, Francesco da Carrara the Elder, and Francesco's court. Giusto was probably called to fill the vacancy left by the death of the most important earlier local painter, Guariento di Arpo, who had enjoyed the patronage of the house of Carrara. From 1373 to 1382, Giusto is mentioned in Paduan documents at regular intervals. He became a citizen of Padua in April 1375. After 1382, there is no mention of Giusto in the Paduan archives until July 1387. He died in Padua sometime between then and May 1391. His name is inscribed in 1387 in the register of the painters' guild in Florence, but there is no evidence that he was there at the time.

Giusto de' Menabuoi (ft. 1349-1390), ceiling frescoes, Baptistery, Padua. Photo: © Scala/Art Resource, N.Y.

The most important works by Giusto in Padua are not strictly documented, but they are strongly supported by local tradition and by comparison with signed paintings from his Lombard period. They are the votive fresco of the Coronation of the Virgin in the basilica of Saint Anthony (c. 1380); the heavily repainted frescoes in the Belludi (or Conti) Chapel of the same church, depicting scenes from the legends of the Blessed Luca Belludi, Saint James the Less, and Saint Philip, probably newly completed for the consecration of the chapel in September 1382; and the decoration of the cathedral baptistery.

The Romanesque baptistery was redecorated by Giusto to serve as the mausoleum of Francesco da Carrara the Elder and his wife, Fina Buzzacarina. Work probably had been completed by October 1378, when Fina was buried in her wall tomb (later destroyed). Francesco, who died in a Visconti prison at Monza, was interred in November 1393 in a freestanding sepulchre (also later destroyed). The fresco decoration covers every available surface and is encyclopedic in scope. It reflects the dual nature of the building as baptistery and mausoleum—functions that were closely linked since early times. In the principal dome is a representation of Paradise; the Pantocrator and Virgin Orante are Byzantine elements explicable by the proximity of Venice. On the drum is an extensive series from Genesis; and stories of the Virgin, Christ, and John the Baptist cover the walls. The exhaustive Apocalypse cycle in the apse seems to depend, either directly or indirectly, on an illuminated manuscript of the twelfth or thirteenth century. The polyptych is also richly embellished with narrative scenes from the legend of John the Baptist.

The identity of Giusto's master is a subject of debate. Giusto's early works suggest that he was trained in Florence in the workshop of Bernardo Daddi. Giusto turned to Daddi's master, Giotto, for the fundamentals of his style. Direct borrowings from Giotto's work in the Arena Chapel may be seen as early as Giusto's Viboldone Last Judgment and in the London tabernacle. Giusto's Lombard work also reflects Giovanni da Milano; and throughout his career Giusto utilized recent Florentine sources. Giusto influenced Lombard fresco painting in its most advanced Tuscan phase of the 1360s and slightly later manuscript illumination in the region, although Giovanni da Milano, a native, had a more profound impact. Similarly, Giusto's presence helped invigorate Paduan painting at a time when art in Florence had stagnated through a relaxation of Giottesque principles. Again, although Giusto influenced monumental painting and manuscript illumination in Padua until about the turn of the century, the style of a local artist, Altichiero, was dominant. Despite some concessions to indigenous naturalism, particularly an expansion of the number of figures and their spatial setting, Giusto's art was fundamentally Florentine and hence less accessible to local taste.

Glossa Ordinaria: Bible

By 1200, the Old and New Testaments were a comparatively small part of a compendium of "sacred scriptures," though they remained the most important part. The Bible by this time had become dwarfed by "glosses": marginal commentary and interlinear notes. A thirteenth-century master of theology, when he read his multivolume *Textus bibliae cum glossis* ("text of the Bible with glosses"), would move his eye from a few verses of the Bible in the center of the page (the text), to phrases in smaller letters placed above the appropriate biblical words (the interlinear gloss), and finally to lengthy, dense interpretive material in the margins (the marginal gloss). These glosses, having achieved after 1200 a relatively set form, and soon thereafter the status of a regular school text, thus composed the "standard gloss," or *Glossa ordinaria*, to the Bible. The word *ordinaria* is a later addition; those who used the work in the twelfth and thirteenth centuries called it simply the *Glossa*. The content of each part, marginal and interlinear, was basically the same; the interlinear version was simply more cursory and convenient.

No manuscript has been discovered that lacks either set of glosses. Each biblical book was also introduced with prefatory material written, for the most part, by Jerome (died c. 420).

Glosses were appended especially to those books that the medieval reader regarded as authoritative and hence to be taught. A gloss could serve as a note to aid in the delivery of an oral lecture on the text, or as a guide to assist a future reader. Many of the earliest glosses on a text were only crabbed notes inserted here and there by masters (and students who listened to them) and were of little value to later interpreters. But the glosses of respected teachers were reproduced by copyists along with the basic text. Most of these additions were themselves excerpts from church fathers and certain medieval authorities. Eventually, from the pens of subsequent glossators of a certain text, successive layers of notes accrued and, when merged together, formed the standard gloss for that book. The civil law *Digest* of Justinian, as well as the church law *Decretum* of Gratian, acquired extended commentaries. Thus each discipline—Roman law, canon law, and biblical theology—produced its own *Glossa ordinaria*.

The formation of the biblical *Glossa* preceded that of the legal glosses, but its editors and stages of development are much less understood. From Carolingian times on, prefaces to the biblical books had been inserted into the Vulgate, and the resulting apparatus, called an "expositor," was used into the twelfth century. Some books were studied in the light of continuous commentaries composed by Augustine, Bede, and others. Several generations ago, it was thought that the marginal part of the *Glossa* was also from Carolingian times and had been produced by Walafrid Strabo (d. 849). However, in the 1930s, largely through the labors of Beryl Smalley at Oxford, it became clear that the *Glossa* was a compilation of previous materials, mostly extracts from patristic authorities, appended to the biblical text in an organized manner by scholars during the late eleventh century and the twelfth. The most important of these scholars were Anselm (d. 1117) and his younger brother Ralph (died c. 1134) in the cathedral school at Laon. Their arrangement of traditional material was produced, their contemporaries said, "by a new kind of exposition" (*novo expositionis genere*). They were regarded not as "authorities" (*auctoritates*) but as "arrangers" (*ordinatores*). Peter the Chanter (d. 1197), writing many

years later, lamented that Anselm "was prevented from glossing the whole Bible by the many demands made upon him by the canons whose dean he was." Another remembrance, less complimentary, by Peter Abelard (d. 1142), described Anselm as a dull pedant. But the composite picture of Anselm that emerges is of a productive and pragmatic compiler who conceived the idea of a comprehensive Bible commentary and made important contributions to this goal but was forced to bequeath the completion of his project to others. To Anselm himself we may credit parts of the *Glossa* on the Psalms, the Epistles of Paul, and much of the commentary on the Gospel of John. To Ralph we may attribute the formation of some material on Matthew and, possibly, the minor prophets (though Gilbert the Universal may have contributed these). Some of this work was no doubt performed by scholars under Anselm's guidance.

By 1128, additional compilations on the Pentateuch, the major prophets, and Lamentations were added by the lawyer Gilbert the Universal (d. 1134), who put his name to individual glosses. Many other contributors remain anonymous. Smalley once argued that glosses on the entire Bible, forming a kind of proto-*Glossa*, were in place by 1130. More recent scholarship casts doubt on this claim, suggesting that the process of glossing the biblical corpus was more protracted and complicated. At any rate, by this time the Laon manuscripts, such as they were, circulated among scholars, were altered, and acquired interpolations—glosses on the *Glossa*. Among the later contributors were Gilbert de la Porree (d. 1154), who was a disciple of Anselm and later bishop of Poitiers; and Peter Lombard, bishop of Paris (d. 1160). Each supplemented Anselm's glosses on the Psalter and the Pauline epistles. The expansion contributed by Gilbert was called *Media glosatura*; that of Peter Lombard was called *Magna glosatura*. By the later twelfth century such growth slowed, and a more or less set form emerged.

The *Glossa* was also being widely distributed. By 1200, copies of at least parts of the *Glossa* were in practically every library in Europe. It eclipsed all other biblical commentaries. To be sure, it did not contain the most innovative biblical exegesis. As one scholar has written, its value was as a "practical aid for students beginning on their study of the Bible." It offered variant readings; possible resolutions of difficulties

in the Latin translation from the original Greek or Hebrew; literal, allegorical, and moral interpretations; outlines and summaries of value to preachers; explanations of anthropomorphisms; reconciliations of apparent inconsistencies; and much else besides.

The church had long taught that the Bible was correctly read in the light of authoritative and traditional interpretation. The Bible's meaning was not thought to be "perspicuous" (as later Protestants were to argue) to the solitary and allegedly "Spirit-led" reader. In the eleventh and twelfth centuries, however, the newly established towns were producing visionaries and reformers who used the Bible to support revolutionary ideas. Thus churchmen, opposed to the heresies of some of these preachers, preferred a glossed or "interpreted" Bible. Glosses couched the sacred text within the citadel of orthodox interpretations, the understanding of which required formal education, and thus guarded biblical theology from those who would be innovators rather than follow holy tradition. Accordingly, the interlinear gloss described the occupants of the office of "prophet" (Ephesians 4.11) as the "interpreters of the Scriptures" (*scripturarum interpretes*); and the marginal gloss (on 1 Timothy 3.8) warned against "those who engender controversies" (*qui seminant discordias*).

Biblical glosses also conveniently arranged the great authorities—Augustine, Jerome, Gregory, Bede, and others—for use by orthodox clerics who were themselves taking a greater interest in preaching and pastoral work. The twelfth century, often described as a "renaissance" of classical learning, also produced an evangelical awakening. This revival, embraced largely by the less educated members of society, in time included students in the cathedral schools (which by 1200 were evolving into universities). Peter the Chanter, mentioned above, a theologian at Reims who composed commentaries on all the books of the Bible, lamented the lack of evangelical preaching (calling it a "most dreadful silence") and was himself part of a homiletical renewal movement that included Peter Lombard as well as Peter Comestor (died c. 1180), chancellor of the cathedral school in Paris. These scholars and others aimed at putting such practical aids as glossed Bibles into the hands of pastors who would use them to apply the gospel to Christian society. Thus Proverbs 27.23, "Know the countenance of thy cattle," was glossed as "It is said to the pastor of a church: Diligently care for those over

whom you will be placed, know the souls and works of each one"
(Pastori ecclesiae dicitur, diligenter adhibe curam iis, quibus te praeesse contigerit; agnosce animos actusque singulorum).

Biblia sacra, cum glossa ordinaria . . ., Lyon, 1589. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Finally, in the thirteenth-century university, the *Glossa* became a

required textbook. At the University of Paris the basic course—offering bachelor's and master's degrees—was in the secular arts. The chief authority here was Aristotle. Higher study, available after the bachelor of arts (though some took a master of arts first), could be pursued in medicine, law, and theology. Theology was by far the most difficult, sometimes requiring upward of sixteen years of postbaccalaureate study. Students in this graduate program mastered several texts, principally the glossed Bible and the *Sentences* of Peter Lombard. At Paris, the Bible was read before Lombard; at Oxford, the order appears to have been reversed. (At Bologna, the most important Italian university, arts and law predominated; theology, until the fourteenth century, was confined to the cathedral schools and the study houses of the friars.) Accordingly, at the hands of the schoolmen of Paris and Oxford, the *Glossa* furnished proof texts for academic disputation. For example, in the controversy at Paris between the regularly ordained theologians ("seculars") and the friar-theologians ("mendicants"), the seculars used the gloss on Luke 10.1: "So in the twelve apostles is the form of the bishops, and in the seventy-two disciples is the form of the priests" (*Sicut in 12 apostolis forma est episcoporum, sic in 72 discipulis forma est presbyterorum*). That is, according to the seculars, the gloss authorized bishops and priests, but no third order such as the friars. In turn, Thomas Aquinas and Bonaventure, friar-theologians, used extracts from the *Glossa* on almost every page of their defenses of mendicancy.

The year 1300 marks the apogee of the *Glossa*'s popularity. For most of the fourteenth century, biblical study at Paris and Oxford declined, as strong interests in logic and various sciences took precedence over theology. Around 1370, there was a resurgence of biblical commentary, most notably the treatises of the proto-Reformer John Wyclif (d. 1384), which ran counter to the exegetical milieu that had produced the *Glossa*. The *Glossa* continued to be copied, and from the sixteenth through the eighteenth centuries it was printed many times, often accompanied by the glosses of others, such as Nicholas of Lyra (d. 1349). It was nonetheless rendered largely obsolete by an increasing emphasis on the literal meaning of the Bible and by new trends in both piety and doctrine.

There is no translation or modern scholarly edition of the *Glossa*. The excerpts quoted here are from an early printed edition at the

Spencer Research Library, University of Kansas, Lawrence: *Textus biblie cum Glosa ordinaria*. A poorly edited but sometimes useful text of the marginal gloss is available in Migne (the authorship is ascribed to Walafrid Strabo).

Glossa Ordinaria: Civil Law

The *Glossa ordinaria* for civil law were the standard medieval set of annotations to the texts of Roman and later civil law; these texts formed the basis of legal education, first at Bologna in the late eleventh century and eventually throughout Europe. The texts were the component parts of Justinian's so-called *Corpus iuris civilis*—i.e., *Institutes*, *Digest*, *Code*, and *Novels* (533-556)—plus the feudal customs of Italy: *Libri feudorum*. The purpose of lectures in a law school was to familiarize the student thoroughly with these texts; therefore, the teacher would read the text aloud in class (*lectura*) while interpolating his own explanations and comments. The method of "glossing" a text by explaining difficult words and terms had been in use since late antiquity for classroom texts of all kinds—literary, scientific, and biblical as well as legal. The twelfth-century law teachers at Bologna applied this method to their texts so systematically, however, that they came to be known collectively as the "glossators." The earliest surviving Bolognese glosses are class notes taken from individual professors, but by the thirteenth century these were being compiled into a single series, or apparatus (e.g., by Azo and Hugolinus). This process culminated in the greatest compilation of all, the *Glossa ordinaria* of Accursius, which incorporates 10,400 references to his predecessors' work. He began with *Institutes* (first version before 1234), proceeded through all the books of civil law (*Libri feudorum*, done by c. 1250), and then returned to *Institutes* and started a revision of his work that was still in progress when he died in 1263.

The Accursian apparatus was a watershed in legal studies. It summarized the work of the glossators so completely that all law teachers adopted it. Accursius's sons and students added further refinements to his apparatus, such as summaries of each title (*casus*) and afterthoughts (labeled *additiones*); but the major lawyers after 1250, known collectively as the "postglossators," instead wrote systematic expositions (*summae*), commentaries, briefs (*consilia*), and specialized treatises. Accursius, the last of the glossators, came to be known as "the Glossator" *par excellence*.

The *Glossa ordinaria* consisted of a series of 96,940 notes to the text,

which were so extensive that, instead of being mere footnotes, they framed the text on each page. A law student would buy a copy of his course text that included the ordinary gloss. The *Glossa* offered many kinds of assistance, starting with elementary notions at the beginning of *Institutes* and gradually introducing more complex material. A basic gloss simply explained a word—e.g., "*barbaricae*: Barbarians are those who are outside the Roman empire, and especially enemies" (*Institutes*, paragraph 1). Often the student was taught by example how to use legal texts to argue questions pro and con. For instance, *Institutes* 1.2.9 reads: "Long-standing custom based on the consent of those who observe it is just like legislation." At the word "Long-standing," the gloss asks:

But how long does it take for usage to make a tradition or custom? Answer: ten years, per *Digest* 40.9.16.3, although some say that the time required must go back longer than anyone can remember, as can be argued from *Digest* 39.3.1.23 ["for a long time"], and *Digest* 43.20.3.4 ["beyond anyone's memory"], and *Code* 1.2.23.3 ["a hundred years"]. . .

Above all, the *Glossa* cross-referenced *Corpus iuris civilis*, making it an invaluable research tool even today. Moreover, chiefly by making distinctions, the glossators attempted to harmonize what seemed to them discrepancies between their texts; similarly, they tried to accommodate Justinian's system to the altered circumstances of medieval Italy, where Roman law was still widely used. Until these misapprehensions were corrected by humanistic jurists in the sixteenth century, the *Glossa* for three centuries dominated the study and practice of civil law throughout Europe. Many editions were printed, usually in five folio volumes, the first appearing in 1468 and the last in 1627.

Modern legal historians, mainly in Italy and Germany, have long studied the *Glossa* extensively to reconstruct its evolution, but there is as yet no critical edition. More recently, since Post (1964) showed how the *Glossa* can illuminate the history of political ideas, it has become a common tool for anglophone historians as well. Its effective use requires knowledge not only of Latin and paleography but also of the civilians' system of citation (which can be acquired from Bryson 1975).

In sum, the *Glossa ordinaria* is the principal result of the twelfth-century revival of Roman law, which made Italy in general and Bologna

in particular the center of medieval legal studies.

Glossa Ordinaria: Roman Law

The *Glossa ordinaria* on the *Corpus iuris civilis* of Justinian was

composed during the early and mid-thirteenth century by Accursius, the greatest of the "glossators"—the earliest school of medieval commentators on Roman law. Other names for this work are *Glossa magistralis*, *Glossa magna*, and *Glossa accursiana*. Accursius was the first to provide a comprehensive gloss on every constituent part of *Corpus iuris civilis* (*Institutiones*, *Codex*, *Digesta*, and *Authentica* or *Novellae*) and on the standard collection of Lombard feudal law, *Libri feudorum*. His raw material certainly included the major writings of Azo (his teacher), Hugolinus, and Johannes Bassianus; it probably included the work of contemporaries such as Odofredus, Symon Vincentius, and Jacobus Balduini; and it ranged back through the entire glossatorial literature of *summe*, *apparatus*, *distinctiones*, *quaestiones*, and *dissensiones doctorum* produced in more than a century of Roman law scholarship since Irnerius (died c. 1125). The *Glossa ordinaria* differed from earlier glossatorial apparatus only in size and completeness, not in kind. Johannes Teutonicus (canonistic author of the ordinary gloss on the *Decretum*) and Jacobus Colognensis (feudist author of the gloss on *Libri feudorum*) also influenced Accursius—the former by suggesting the genre of an ordinary gloss, the latter probably by supplying the foundation material for glossing feudal law.

Accursius certainly composed some of the *Glossa ordinaria* early in his career, that is, during the 1220s. The traditional view was that the *Glossa* was completed c. 1228 and that there was a second edition of his gloss on *Institutiones* early in the next decade; but this now seems open to question, especially given the vast size of the work and indications that Accursius continued glossing these texts for several decades. A time frame of 1220-1250 for the composition of the *Glossa* seems safer. It is probable that Accursius completed his gloss on *Institutiones* first, but the order of composition of the remaining portions of the *Glossa* is not known. Because the glosses of many civilian jurists who preceded Accursius have not yet been printed, and because our knowledge of this literature is insufficient, it is difficult to judge whether he saved the worthy comments and ignored those that were unnecessary. Also, the proper attribution of passages in the *Glossa ordinaria* is unclear, precluding a definitive determination of this matter. The manuscripts and incunabula of the *Glossa* use various *sigla* for Accursius's name: *Ac.*, *ac.*, *Acc.*, *acu.*, *accur.*, *Accurs.* *Flor.*, *acsius*. Savigny (1850) believed

that, by right, *every* entry of the *Glossa* should have been followed by one of these *sigla*, and that if no *siglum* appears, an oversight on the part of Accursius himself or a subsequent copyist was to blame. Whether or not we accept Savigny's assertion, problems of attribution still remain. We cannot assume that a gloss under Accursius's own *siglum* indicated his own original work, because he may have appropriated someone else's ideas wholesale, or revised them, without attribution. Also, misattributions by subsequent scribes and printers remain a possibility; this holds as well for attributions of gloss entries to other jurists. In any event, though, we can be more sure about the enormous labor expended by Accursius. From a large and dispersed antecedent literature he selected, transcribed, condensed, and conflated glossatorial texts from various interpretative strata, adding his own comments as he went along. As a result, the *Glossa* provided a continuous series of glosses whereby the authors (or, better, authorizers) of the most important opinions were identified and attempts were made to reconcile conflicting interpretations.

Let us now turn to a detailed analysis of the *Glossa*, which was a marginal (not interlinear) gloss *par excellence* wherein substantive juristic comments far outnumbered simple etymological explanations. It is 2 million words long and contains 96,940 separate glossatorial entries distributed among the constituent parts of *Corpus Iuris Civilis*: 62,577 to *Digesta*-, 21,933 to *Codex*-, 7,013 to *Authentica* (minus *Codex*, books 10-12); and 4,737 to *Institutiones*. The gloss to *Libri feudorum* contains 680 entries. As regards the glossing of *Authentica*, there is no proof that Accursius knew any Greek (the original language of most of this book), and thirty-six of the 134 *novellae* were not glossed at all, either because Accursius considered them unimportant or because he thought they required no further explanation.

The difficulty of assessing *sigla* after gloss entries has already been noted. A conservative explanation would be that the commentator who is indicated by a *siglum* at the very least *authorized* the expressed opinion, if he was not actually the original *author* of it. The *Glossa ordinaria* contains more than 10,000 such allegations, once again distributed among the gloss entries for each part of *Corpus iuris civilis*: 7,440 allegations in the *Digesta* gloss; 2,180 in the *Codex* gloss; 190 in the *Institutiones* gloss; and 530 in the *Authentica* gloss (minus *Codex*,

books 10-12). The gloss to *Libri feudorum* contains forty allegations. Accursius was strongly influenced by his teacher, Azo: 3,879 allegations bear Azo's *sig-lum*. Two other contemporaries were also favorites of Accursius: the opinion of Johannes Bassianus is cited on 1,850 occasions and that of Hugolinus on 1,030 occasions. The teachings of the other great jurists of the previous 125 years also make their appearance; in descending order, we find: Rogerius (920 allegations), Martinus (590), Placentinus (520), Irnerius (330), Bulgarus (315), Albericus (230), Pillius (165), Jacobus (30), and Hugo (10). It is interesting that Accursius did not cite by name several glossators of his own generation, some of whose works he most probably used: Jacobus Balduini (who was perhaps one of his teachers), Odofredus (who was probably one of his students), and Symon Vincentius.

The *Glossa ordinaria* on *Corpus iuris civilis* contains an occasional reference to northern Italian customary law and a few references to *Lombarda*, an eleventh-century collection of Lombard laws. When glossing *Authentica*, Accursius turned frequently to *Epitome Juliani* (a sixth-century Latin collection of Justinian's *Novellae*). There are fewer than 400 references in the *Glossa* to canon law texts—260 to Gratian's *Decretum* and 125 to papal decretals. This is not much, considering the total number of glosses, but it is far more than was customary for earlier glossators of Roman law. As can be expected, these references occur especially where certain topics are discussed: marriage, lending at interest, legal procedure, crime, and prescription. The *Glossa* almost never cites a nonlegal text.

Libri feudorum, a heterogeneous collection of material on feudal law and imperial legislation of the eleventh century through the early thirteenth, was normally added to manuscripts of *Authentica*, thereby becoming a supplement to *Corpus iuris civilis*. Accursius thus provided a complete gloss of this work in the *Glossa ordinaria*. Scholars have traditionally held that this gloss was merely a lightly reworked version of the gloss actually written by Jacobus Columbi, itself a work based on the earlier *Summa feudorum* by Pillius. Recently, this view has been challenged; instead, Accursius is said to have composed the glossatorial commentary himself on the basis of Pillius's work, as well as a new recension of *Libri feudorum*. The issue of original authorship remains at present undecided; however, it is a fact that Accursius's gloss

constituted the written expression of scholarly opinion then current regarding northern Italian feudal law.

The enduring popularity and utility of Accursius's *Glossa* were based not only on its comprehensiveness and exhaustiveness but also on the glossator's ability to pose and answer juristic questions more controversial than those offered by earlier authors. His constant goal was to avoid contradiction in the interpretation of the law; and he felt that this goal was attainable, as he noted in one entry: *omnia contraria possunt solvi* ("All contradictions can be resolved"). Later scholars have identified some 120 instances where the *Glossa* contradicts itself, but this is a minuscule number among nearly 100,000 entries.

The reception of the *Glossa ordinaria* was both immediate and immense. The work was used in the classroom and in legal practice; and the gloss text itself became an object of further scrutiny, prompting the composition of *additiones*, *contradictiones*, and *indices materiae*. It was soon copied into stereotype Bolognese manuscripts of *Corpus iuris civilis* and thus became widely disseminated. There is a notice of its use in Florence in 1258, and it quickly gained a dominant position in northern Italian legal practice during the following decades. Some cities, such as Verona, ascribed to the *Glossa* an importance approaching that of a legal norm. A factor in this ascription was the lack of any de facto superior judicial instance; a *podestà* could protect himself from charges of malfeasance in his judgments by hewing closely to the *Glossa*. The jurists of the fourteenth century—the so-called postglossators or commentators—did not follow the *Glossa ordinaria* slavishly, but they nonetheless regarded it highly, measuring it against the *communis opinio doctorum* (general learned opinion) of their own day. Baldus called Accursius the *carocium veritatis* (chariot of truth), whose opinion should be clung to just as the Bolognese cling to their *carroccio*—their civic standard-bearing war wagon. Even the criticism of the *Glossa* by fifteenth-century Italian humanists (e.g., Valla and Poliziano) for its philological and historical shortcomings was tempered with a realization of its importance. In southern Italy the *Glossa* competed with southern Lombard law and the Norman-Hohenstaufen legislation of the Regno (the kingdom of Sicily).

The *Glossa ordinaria* was known in southern France by the second half of the thirteenth century. French jurists such as de Ravanis and de

Bellapertica certainly worked with it a great deal, but they could be critical of its judgments. In legal practice, the influence of the *Glossa* was not as strong as in northern Italy. French humanist jurists—Bude and Chansonette foremost among them—were very critical of Accursius's "barbarous" style and anachronistic historical sense. By the end of the thirteenth century, knowledge of the *Glossa* arrived in German lands, where it influenced Buch's gloss on *Sachsenspiegel*. In the fifteenth and sixteenth centuries, the *Glossa* was attacked by humanists such as Zasius (with some reservations) and Sichardus; was defended by jurists such as Amerbach, Sabinus, and Saxonium; and underwent a steady eclipse by the works of the great commentators (Bartolus and Baldus). Nonetheless, it was in seventeenth-century Germany that a catchy phrase was first formulated: *quic- quid non agnoscit glossa nec agnoscit forum/curia*, "Whatever the *Glossa* does not recognize, the court does not recognize."

Just before the end of the thirteenth century, knowledge of the *Glossa ordinaria* is attested to in the Low Countries and in Bohemia. In the Low Countries, criticism by the later humanists (e.g., Aytta and Wesenbeck) was tempered by a recognition of the work's great value; still, the decline of its influence in the seventeenth century was considerable. It had a greater impact in Iberia from the second half of the thirteenth century onward; there, it had a strong influence on the Castilian *Las siete partidas* and on the Portuguese *Ordenacoes afonsinas*. According to the latter, the *Glossa* was the third-place authority, after Roman law texts (except where sin was involved) and canon law texts. In Portugal during the sixteenth and seventeenth centuries, the *communis opinio doctorum* had precedence over the *Glossa*; and during the next two centuries the *Glossa* experienced a rapid and drastic fall in influence there. Its reception in Latin America mirrored these developments in Iberia, albeit with a later start and later eclipse.

To sum up the subsequent importance of the *Glossa ordinaria*, we can say without exaggeration that its view of *Corpus Iuris Civilis* as a unity and its enormous range as a work of juristic scholarship—not merely a work of collection—considerably hastened the acceptance of Roman law in Europe and reinforced the decisive effect of that law. The *Glossa* quickly left its mark on instruction, theory, and practice. It

provided an unsurpassed and exact reference to parallel and contrary texts within *Corpus iuris civilis*; and it absorbed, summarized, and perpetuated the work of many important earlier glossators for posterity. The *Glossa* also contributed to the popularity of legal studies, and its interpretations influenced European civil codes of the nineteenth and twentieth centuries.

One might assert that Accursius did his job too well: the appearance of the *Glossa* coincided with the acme and the beginning of decline for the entire glossatorial school of interpretation. The authority of the *Glossa* drew the attention of subsequent scholars away from the law texts themselves; thus, increasingly, the earlier glosses were no longer read, copied, or taught. Sometimes other and older manuscript glosses were even erased so that the *Glossa* could be recopied in the margins. In the years following Accursius's death, no one attempted to compose another comprehensive glossatorial *apparatus* on *Corpus iuris civilis*. In essence, the method of the glossatorial school had involved an application of sixth-century texts to thirteenth-century circumstances and procedures: text yielded to gloss, and an authoritative gloss (such as the *Glossa*) would then be followed mechanically. Not until the rise of the postglossators or commentators (e.g., Cinus, Bartolus, and Baldus) of the fourteenth century would this tradition be repudiated.

However, Accursius cannot be blamed completely for his immediate successors' slavish adherence to the *Glossa* or for posterity's immoderate grant of authority to it. It is true that many glosses which he did not report in his *Glossa* were probably thereby consigned to oblivion; but this observation should be balanced by another—that the immense glossatorial literature extant today might not have survived if he had not included it. Some 1,200 medieval manuscripts of *Corpus iuris civilis* contain part of all of the *Glossa Ordinaria*; no archetype manuscript or leading manuscripts can be identified. From 1475 onward, printed editions of discrete portions of the *Corpus* contain the appropriate portion of the *Glossa*; many printed editions of the entire *Corpus* contain the entire *Glossa*, among them Mainz (1476), Venice (1487-1489), Paris (1571), Venice (1572), Basel (1572), Basel (1593), and, of special value, Lyon (1589). The last printed edition, prepared under the auspices of the humanists, was Lyon (1627); both it and Venice (1487-1489) have been reprinted in facsimile; respectively, Osnabriick

(1966) and Tours (1968-1969). The beginnings of a modern scientific-critical edition of the *Glossa ordinaria* can be found in Torelli (1939-1940, 1992).

Godfrey of Viterbo

The poet-historian Godfrey of Viterbo (c. 1125-after 1202) was Italian by birth but of recent German ancestry. He was taken to Germany at an early age and was educated in the cathedral school of Bamberg. Returning to Italy, probably shortly after 1140, he entered the papal chancery; but within a decade he was back in Germany as a member of the royal chapel under Conrad III (d. 1151). Godfrey served the emperors Frederick I Barbarossa and Henry VI as court chaplain and notary, taking part in their Italian expeditions until at least 1186, when he witnessed a document for Henry during the siege of Orvieto. His official travels also took him to France many times and less often to Provence, Sicily, and Spain. After he had retired to his native Viterbo, he revised and in 1191 completed his selective world history in Latin verse and prose, *Pantheon*. A note at the end of a later poem, *Gesta Henrici sexti* (*Deeds of Henry VI*), mentions the death in Sicily of the imperial steward Markward of Anweiler (September 1202). The aged Godfrey is unlikely to have long survived Markward.

Pantheon, Godfrey's major literary accomplishment, is in concept a pro-Staufen imperial chronicle from biblical and early pagan times to his own day. Its title—a Greek compound meaning "all-divine"—suggests the universality of its scope and the divine origin of the political and theological wisdom it expounds. This work took shape in several stages, of which the first was the largely verse *Speculum regum*

(*Mirror of Kings*), dedicated to Henry VI and completed in 1183. *Speculum regum* was replaced in 1185 by *Memoria seculorum* (*Memory of the Ages*), subsequently renamed *Liber memorialis* (*Book of Memory*). That in turn was expanded into the more encyclopedic *Liber universalis* (*Book of All*), itself the basis for three successive versions of the final *Pantheon*. Supplementary writings include *Gesta Friderici* (*Deeds of Frederick*), in verse; and the aforementioned *Gesta Henrici sexti*. Godfrey's *Pantheon* entertains as well as instructs and presents as fact, or at least neutrally, a significant amount of popular, legendary, or otherwise fictional material in fulfilment of its political objectives. Especially notable are an influential account of the Trojan origins of various European peoples and versions of the medieval *Prophecy of the Tiburtine Sibyl* and of the Latin romance of Apollonius of Tyre. Godfrey's preferred verse form, an uncommon strophe consisting of two rhyming hexameters followed by a single pentameter, may be thought of as an ennobled elegiac distich.

Godfrey's history, ostensibly aimed at young people but well suited for many adults, was widely read in the later Middle Ages. It survives in at least thirty-three more or less complete manuscripts (including the author's original for most of *Liber universalis*) and in fragments of many others. Resonances can be discerned in the writings of Brunetto Latini, Giovanni Villani, Quilichino of Spoleto, Orfino of Lodi, Riccobaldo of Ferrara, Tolomeo ("Ptolemy") of Lucca, Benzo of Alessandria, James of Acqui, Galvano Fiamma, and William of Pastrengo, to say nothing of the very considerable reception of *Pantheon* among non Italians. The one modern attempt at a critical edition is incomplete and otherwise unsatisfactory.

Godfrey is also the apparent author of a 186-line political-geographical poem with autobiographical content, *Denumeratio regnorum imperio subiectorum* ("List of Kingdoms Subject to the Empire"), whose focus shifts toward the end to German-speaking cities. Other minor writings have, with varying degrees of probability, also been assigned to him.

Gonzaga Family

The Gonzaga family effectively controlled Mantua from 1328 to 1627, first as captains general, later as marquesses, and finally as dukes. The control of Mantua by the Gonzaga originated on 28 July 1328, when Luigi Gonzaga (1267-1360), with the help of Cangrande della Scala of Verona, staged a coup in which he wrested power from Passarino Bonacolsi, whose family had ruled Mantua since 1274. In 1329, Luigi was nominated captain general and named imperial vicar by Emperor Louis IV. Louis's successor, Charles IV, completed the transfer of power to the Gonzaga in 1331, naming Luigi vicar of Cremona, Reggio, and Asola; granting him title to the Bonacolsi estates; and extending Mantua's realm to the banks of Lake Garda. Luigi was succeeded by his son, Guido, a friend of the poet Petrarch. When Guido died in 1369, his son, Ludovico—who had killed his own brother, Ugolino, to ensure his succession—became captain general. A marquisate was conferred on Ludovico's grandson, Gianfrancesco, on 22 September 1433. In 1530, Mantua was made a duchy with Federigo II, Gianfrancesco's great-great-grandson, as the first duke. During the Renaissance, in particular, the Gonzaga were great patrons of culture and the arts. The last duke in the Gonzaga line died in 1627.

Gothic Wars

The struggle of the Byzantine emperor Justinian to recover Italy from its occupation by the Ostrogoths was only a part of his so-called reconquest program, aimed at reconstituting the traditional Mediterranean totality of the old Roman empire.

As in his previous project to destroy the Vandal kingdom of North Africa (533-534), Justinian developed a diplomatic pretext of pro-legitimist intervention in a local dynastic struggle: in this case, the unstable succession to the regime of the late Theodoric, climaxed by the murder of Amalasuntha by *Theodahad* in 535. While one general was dispatched to seize Gothic holdings in Ilyricum, Justinian relied on the military genius of his general Belisarius to lead the main effort against Italy. With a small expeditionary force, Belisarius landed in Sicily in late 535 and quickly occupied the island. After a digression to quell a mutiny in North Africa, he crossed to the mainland in 536 and moved up through the peninsula. Encountering resistance from Naples, he stormed and sacked the city to set an example (in the autumn), and by early December he occupied the city of Rome.

Having replaced Theodahad with Witigis, the Goths finally had an energetic leader who would fight. For a year (537-538) the new Gothic king besieged Rome, but Belisarius resisted brilliantly. Strengthened by the arrival of reinforcements, and rejecting a negotiated settlement, Belisarius renewed pressure northward. The arrival of a new imperial commander, the eunuch Narses, introduced dissension among Belisarius's subordinates and disrupted operations. As a result, an imperial column that had moved north and occupied Milan in the spring of 538 was left stranded and unable to hold out against a Gothic siege. When Witigis took the city by storm in March 539, its entire population—some 300,000 inhabitants—was massacred. This shocking

episode prompted Justinian to withdraw Narses and reaffirm Belisarius's sole command.

Hostilities were indecisive, and the Gothic position was weakened by an intervention from the north by the Franks. Increasingly desperate, Witigis initiated negotiations with the king of Persia, encouraging him to open war against the empire in the east to distract Justinian's resources. Anxious at this prospect, Justinian was disposed toward a diplomatic settlement in Italy, while Belisarius was moving, by late 539, to blockade the Gothic leaders in their capital, Ravenna. There was a stalemate, and the Goths offered to surrender to Belisarius if he would put himself at their head and take the title of Roman emperor in the west. Belisarius had no such ambition, but he feigned interest, accepted the surrender of Ravenna (in May 540), and then rejected their proposal.

Justinian, however, was furious at Belisarius's apparent consideration of the proposal and recalled him in disgrace. The new imperial commanders were venal and incompetent. Extensive Gothic elements still controlled Italy north of the Po River, and after a series of lurches in leadership they chose the obscure but resourceful Totila as their new king in the fall of 541. Appealing both to Goths and to discontented Roman provincials, Totila began an astonishing counteroffensive, easily cutting a swath through the inept imperial forces and—by the spring of 543—taking Naples. Justinian, recognizing that the only man who could salvage the situation was Belisarius, restored him to command in 544 but provided no direct support. Belisarius therefore was required to finance a new campaign, in effect, from his own pocket. Setting up command in Ravenna, Belisarius moved to relieve Rome, which Totila invested at the end of 545. The effort failed, and the Goths took Rome—an important symbol—in December of the following year. However, in the spring of 547 they abandoned it to Belisarius, who refortified it; Totila then made a new attack, but without success.

Though Belisarius had halted Totila's momentum, the two opponents could only play a chesslike game of reactive moves against each other up and down the peninsula. Belisarius attempted to appeal for proper support through the empress Theodora; but her death in June 548 ended his last hope, and he requested a recall so that he could retire in Constantinople. His departure left the imperial forces leaderless, and

Totila resumed the initiative. Totila took Rome again in January 550 and, when his peace overtures to the emperor were rebuffed, briefly seized Sicily. Justinian prepared his cousin Germanus to lead a new offensive and even married Germanus to a Gothic princess, but this effort was aborted when Germanus died in late 550.

Justinian finally turned to the now aged Narses, who was given the resources to assemble an army in the Balkans during 551, while Totila expanded his naval strength and seized Corsica and Sardinia. Marching around the Adriatic in the spring of 552, Narses reached Ravenna and then moved decisively to face Totila at Busta Gallorum (Teginae) in late June. Totila's forces were utterly defeated and he himself was fatally wounded. The surviving Goths elected Teias as their new king; meanwhile, Narses moved south, seizing Rome and moving to attack the Goths' southern stronghold and treasury at Cumae. Attempting to relieve Cumae, Teias took up his position on the slopes of Mount Vesuvius, where he was defeated and killed (on 30 October). The Ostrogothic nation was effectively broken.

Narses was still obliged to deal with remaining pockets of Gothic resistance scattered around Italy. Also, an invading force of Franks and allied Alamanians was destroyed at Capua in 554; in the same year, Justinian's "pragmatic sanction" provided a formula for reestablishing his government in the peninsula. With the capture of Verona in July 561, the last of the Gothic enclaves north of the Po was eradicated and the imperial conquest of Italy was completed.

Grado, Patriarchate of

Grado, an island in the Adriatic north of Venice, was the seat of the patriarch of the Venetian church from 568 to 1451. The patriarch of Aquileia, the metropolitan of northeastern Italy, fled to the island of Grado to escape the Lombards in 568. He had joined the schismatic patriarch of Milan against Rome and Constantinople by refusing to condemn the "Three Chapters" as demanded in 553 at the Second Council of Constantinople held by Emperor Justinian. The papacy in Rome, loyal to Justinian, condemned the Three Chapters. In 607, the schism was renounced by the new patriarch of Grado whom the pope and the Byzantine exarch of Ravenna had selected. The Arian Lombards rejected him, giving their allegiance instead to the regularly elected but schismatic patriarch of Aquileia. Thus two patriarchs claimed authority over the church in northeastern Italy: the patriarch of Grado, loyal to Rome and the Byzantine empire, ruled over churches in the lagoons (Venetia), Istria, and the exarchate from his cathedral of Sant'Euphemia in Grado; the Lombard patriarch of Aquileia had

authority on the mainland from the Adda River to eastern Friuli and lived first at Cormons and then at Cividale. This latter patriarch abandoned the schism in 698 and later returned to rebuild Aquileia.

For more than 400 years, the patriarchs of Grado, supported by the doges of Venice, fought the patriarchs of Aquileia politically, ecclesiastically, and militarily. The patriarchs of Aquileia were supported by the Lombard kings and their successors, the Carolingian emperors, the Ottonians, the Suabians, and the Hohenstaufen. Patriarch Poppo of Aquileia (1021-1044) conducted exceptionally violent attacks on Grado, destroying churches and sacking the island. Subsequently, the patriarchs of Grado resided in Venice, in the parish of San Giovanni Elemosinario and later in San Silvestro.

The jurisdictional quarrel between Grado and Aquileia was settled during the long reign of Enrico Dandolo (a relative of Doge Enrico Dandolo) as patriarch of Grado from 1129 to 1188. Although Patriarch Enrico considered the church superior to the state, he was unable to gain the freedom of clerical elections of which the Concordat of Worms (1122) had assured the imperial church in Italy. Under Doge Pietro Polani (r. 1130— 1148), the commune of Venice won complete control over clerical elections, and the Venetian church lost its influence over political affairs. The patriarch also lost jurisdiction over Istria when Pope Innocent II confirmed it as part of the patriarchate of Aquileia. However, Innocent II did recognize the patriarch of Grado as metropolitan over the Venetian lagoons, Split, and the Dalmatian islands of Arbe, Veglia, and Ossero. Later, this patriarch was named primate of Dalmatia (1155), metropolitan of all Latin bishops in the Greek East (1157), and metropolitan over 'Trau' and Ragusa (1171). In 1180, in the aftermath of the peace of Venice between Pope Alexander III and Frederick I Barbarossa, hostilities between Grado and Aquileia were formally ended. The Latin conquest of Constantinople in 1204 extended the jurisdiction of the Venetian church because the crusaders agreed that Venice should thereafter always nominate the Latin patriarch of Constantinople. That patriarch held office until Manuel Paleologus reconquered Constantinople in 1261.

The patriarchs of Grado and their subordinates were nominated by the Venetian senate after 1394, and their names were merely sent to Rome for confirmation. No non-Venetian was ever selected as patriarch.

The title of patriarch of Grado was abolished in 1451 when Pope Nicholas V named Saint Lorenzo Giustinian, bishop of Castello (in Venice) and patriarch of Grado, as patriarch of Venice. Henceforth his cathedral was San Pietro in Castello (the basilica of San Marco continued to be the doge's private chapel until the fall of the Venetian republic). The title of patriarch of Venice remained in use in the twentieth century.

Gratian

The Bolognese jurist Gratian (mid-twelfth century) is famous as the author of *Concordia discordantium canonum*, better-known as the *Decretum*. This collection of church laws remained in use in law schools and courts for the rest of the Middle Ages and beyond, until 1917.

Very little is known about Gratian's life. He was perhaps the Gratian who in 1143 in Venice, together with two other Bolognese jurists, advised a papal legate on a legal issue. Assertions that he was a monk or a bishop rest on precarious evidence. From the form and contents of the *Decretum*, it seems clear that he was a teacher of canon law.

The *Decretum* first circulated in a short version preserved in four manuscripts and a fragment (not edited, but for lists of its contents see Winroth 2000). This first recension was finished in 1139 or somewhat later; the second recension was completed by the early 1150s (see Friedberg 1879). It has been argued that Gratian was the author of only the first recension and that a student of his who had also studied Roman law was responsible for the second recension; for convenience, the two supposed authors are called, respectively, Gratian 1 and Gratian 2.

The first recension contained approximately 1,900 excerpts of ecclesiastical law, or canons. The canons were accompanied by brief comments (*dicta*) in which Gratian interpreted the legal texts and attempted to harmonize contradictions among them. The first recension was included, practically complete, in the second recension, which added further canons so that the total amounted to some 3,800. Only a few new *dicta* were composed for this recension. The second recension became accepted as the definitive collection of earlier legislation (the *ius antiquum*), and later canonists only rarely went back to earlier sources.

The legal texts quoted in the *Decretum* derive from many kinds of sources, including general and provincial councils, papal decretals, the writings of the church fathers, the Pseudo-Isidorian decretals, penitentials, and secular law. In most cases, the authors of the *Decretum* took these texts not from the original sources but from earlier canonical collections.

Gratian 1 used a larger set of sources than his successor; these sources included, notably, Ivo of Chartres's *Panormia*, Anselm of Lucca's collection, Gregory of Saint Grisogono's *Polycarpus*, Alger of Liège's *De misericordia et iustitia*, and *Collectio tripartita*. Gratian 2 based much of his work on only three sources: *Tripartita*, *Collection in Three Books*, and Justinian's *Corpus iuris civilis*.

The third part of the *Decretum*, *De consecratione*, was added,

complete, in the second recension. The structure of the work is otherwise similar in both recensions. In the first recension, the first part was a long treatise without any internal divisions; in the second recension it was divided into 101 *distinctiones*. The second part was divided into thirty-six *causae*, outlining thirty-six more or less complicated legal cases. In each case, Gratian isolated two to eleven questions and treated them separately in *questiones*. The subjects treated include the nature of law, the hierarchy of the church, clerical ordination, legal procedure, the power and duties of bishops and the clergy, ecclesiastical censure, monasticism, heresy, marriage, and penance. The only major subject added in the second recension was law concerning the remaining sacraments (in *De consecratione*).

In collecting a mass of law, Gratians 1 and 2 followed in the footsteps of earlier canonists. Gratian I's innovation was to apply the dialectic methods of early scholasticism to the body of law that he had collected. Foremost among his methods of reconciling seemingly contradictory statements is the distinction between different meanings of the same word. Elsewhere, he points out that a specific law concerns a special case, place, or time. The methods were probably inspired by Ivo of Chartres's *Prologue* and Alger of Liège's *De misericordia et iustitia*. There is no evidence that Gratian I's methods were influenced by Aristotle, Peter Abelard, or Roman law.

Gratian 1 shows very little knowledge of Roman law from Justinian's codifications; instead he made use of pre-Justinian Roman law transmitted, for example, through *Lex Romana Visi-gothorum* and the Pseudo-Isidorian decretals. His reliance on so-called vulgar Roman law meant that his concept of many legal issues appeared disturbingly primitive to Gratian 2, who in such cases supplemented the first recension with skillful compilations of excerpts from *Corpus iuris civilis*.

Also, in purely canonical matters the work of Gratian 2 is characterized by more sophisticated jurisprudential thinking than the work of Gratian 1. For example, Gratian 2 introduced the important distinction between "excommunication" and "anathema" as technical terms. Gratian 1 had used the two terms interchangeably for rhetorical variation. Since Gratian 2 seldom changed or deleted the original text of Gratian 1, the resulting text often seems confused

An enormous number of glosses and commentaries on Gratian's *Decretum* are preserved. Important commentaries were composed by Johannes Faventinus, Huguccio, and Johannes Teutonicus, who c. 1215 published what would become the standard gloss, called the *Glossa ordinaria*. Gratian's enduring fame is endorsed by Dante, who places him among philosophers in Canto 10 of *Paradiso*.

Gravina

Gravina is a city in Apulia southeast of Bari, Built on a ravine and originally a cave city, it contained several churches hewn from rock, one of which, San Michele Arcangelo, still contains wall paintings. Thirteenth-century frescoes in the Byzantine style from another of these churches, San Vito, magnificently restored, are conserved in the local museum.

Gravina was first documented in 968 as one of five bishoprics subordinated to the Greek archbishopric of Otranto; it was probably promoted by the Greek authorities as a rival to Lombard Canosa. Although it was restive in Greek hands, Gravina was not conquered by the Normans, under Robert Guiscard, until 1069. It passed to Robert's nephew, Humphrey, who founded a new church, a castle, and, in 1123, a new Latin bishopric. In the thirteenth century it passed to the crown and was sufficiently important for Frederick II to establish there the regional court for Apulia, Basilicata, and the Capitanata. Later Frederick II made Manfred count of Gravina, which supported him against Charles of Anjou; but after Manfred's defeat the town supported Charles against Conradin. Gravina became the center of an appanage created for Charles IPs fifth son, John, later prince of Du razzo. Under Joanna, it was seized by the Hungarians to become a fief of the voivode of T ransylvania. After its recovery by Charles III (of Durazzo) it was ceded to the Orsini (1380), who retained it until 1816.

CAROLA M. SMALL

Greek Language and Literature

The vicissitudes of Greek in medieval Italy are complex. In late Roman antiquity, the language seems to have been used primarily by people who were in more or less regular contact with the Greek-speaking east, as well as more broadly in some areas of continuous Greek settlement; otherwise, it was either defunct or in serious decline. This was so even in large portions of the once Greek territories of the south, the former Magna Graecia ("Great Greece"); these had usually been Greek-speaking in coastal areas only and were by this time also extensively latinized. During late antiquity, there was some immigration of Greek-speakers—including Jews and others from Syria, Palestine, and Egypt—into Italy; how long their offspring continued to speak Greek is unknown. In the Gothic kingdom, a few representatives of ancient traditions of bilingual higher learning, most notably Boethius and Cassiodorus, undertook or stimulated programs of translation for an intelligentsia whose knowledge of Greek was close to nil; their contemporary Dionysius Exiguus, an eastern European "Scyth" living in Rome, performed similar services for church administrators and contemplatives. Though this activity went on at only a few centers, Greek epitaphs of the fifth century and the early sixth century from the catacombs of inland and largely Latin-speaking Venosa, as well as one from Reggio in Calabria dated to 530, remind us that populations of Greek-speakers could also be found along major trade routes.

Justinian's reconquest (534-562) of Italy for what we now call the Byzantine empire (the eastern continuation of the Roman empire) reintroduced Greek, though unevenly, as a language of military, civil, and ecclesiastical administration. The empire was still officially bilingual; much of the army and indeed the emperor himself came from

Latin-speaking areas of the Balkans; and the number of newly arrived Greek-speakers would at this time have been rather small. After the subsequent Lombard invasion (568—c. 605; Liguria and the remaining Venetian mainland were occupied in the early 640s), Greek-speaking communities existed in many parts of Italy that were still ruled from Constantinople: Sardinia, eastern Sicily, Calabria (ancient Bruttii), the Salentine peninsula (ancient Calabria), several ports on the Tyrrhenian and Adriatic coasts, and the administrative centers of Rome and Ravenna. In all these places Greek was ordinarily a minority tongue, though seemingly less so in Sicily than on the mainland or in Sardinia. Elsewhere in Italy, there was very limited reading knowledge of the language, chiefly for ecclesiastical purposes.

The form of Greek in ordinary written use was *koiné*—"common," that is, common speech. This was a Hellenistic expansion of a converged Attic-Ionic dialect and thus in large part an offshoot of the classical Attic parent of that dialect. In Sicily and parts of the southern mainland, *koiné* had interacted with local dialects dating from the pre-Roman period and belonging to a different ancient dialect group, Doric; the nature and duration of these interactions are controversial. The language as a whole, including its Italian manifestations, had for centuries been undergoing phonological and morphosyntactic changes. These changes included, but were hardly limited to, a simplification of the vowel system (so-called ioticization, largely complete by the end of the Hellenistic period); a decline in the observance of vowel quantity; the replacement of pitch by a stress accent (with consequent changes in versification practices); the disappearance of middle voice forms; and a loss of the optative except in set phrases. The difference from classical Greek was so clear that, to continue a recognized literary tradition, most high-style texts in late antique *koiné* imitated obsolete features of the older Attic dialect or, if verse, Hellenistic modes of poetic expression.

Greek-language literature was produced in medieval Italy from at least the seventh century into the fourteenth. Essentially, it is a provincial version of Byzantine literature, smaller in scope but paralleling some of the themes, styles, and techniques of metropolitan and other non-Italian Greek literary production. On the religious side, it is characterized chiefly by hymns and other verse and, in prose, by brief

saints' lives and other hagiographic forms intended for liturgical use as well as by sermons, longer biographies of saints, and other exemplary and instructive reading. The most typical form of secular literature is occasional verse, usually in twelve-syllable iambics. Much of the religious literature, and most if not all of the secular literature, uses, to different extents, Atticist or other classicizing idioms inherited from later antiquity. In the tenth and eleventh centuries, greater degrees of stylistic elevation are observable; from the twelfth century onward a more rigorous classicism becomes the literary norm.

Greek-speaking populations waxed or waned as their cities or regions became less or more distant from actual Byzantine rule. Two exceptions were Amalfi and Venice, both early medieval foundations whose mercantile activities brought them into greater contact with Constantinople after they had become territorially independent. Ravenna left the Greek orbit after further Lombard aggression extinguished its homonymous exarchate c. 750; our scant evidence for the continued use of Greek here ceases early in the ninth century. Isolated specimens of Greek-language literature from Ravenna are the funerary inscriptions in verse for the exarch Isaac (who served there from 625 to 642 or 643) and for his eleven-year-old-nephew. The Pentapolis (a Greek administrative term denoting roughly the area from Rimini south through today's Germanically named Marches) was overrun during the later eighth century. Its chief port, Ancona, resisted the Lombards, entered the papal state, and in the latter half of the twelfth century renewed its Greek connection by briefly rejoining the Byzantine empire during the reign of Manuel I Comnenus. A Greek-language funerary inscription with nineteen lines of iambic verse, preserved at Corridonia near Macerata and dated to 1186, has been plausibly connected to this rapprochement.

From the seventh century into the early twelfth, Rome housed an intermittently flourishing and largely monastic Greek community, the *scold Greca*, sustained by immigration from other Greek-speaking areas. A Greek author of note living in Rome during this period was the aged ascetic John (Johannes) Moschus, a refugee from the near east; his vastly popular collection of exemplary narratives, the *Spiritual Meadow*, is thought by some to have been completed in Rome after his arrival in 614 or 615. More arguably Roman, thanks to specific local

references, is the *Passion of Saint Tatiana*, an iconoclastic work and thus from the late seventh to early ninth century. Apparently, another work from Rome is the fabulous *Life of Saint Gregory, Bishop of Agrigento* (late eighth century or very early ninth century) by the priest Leontius, "abbot" of Saint Sabas on the Aventine. The most influential literary representative in the west of the presence of Greek in medieval Rome is probably the ninth-century papal librarian Anastasius, who translated numerous Greek hagiographic, historical, and theological writings into Latin. His counterpart in the east, if we exclude John Moschus, was assuredly the eighth-century pope Zachary (Zacharias), who translated the Latin *Dialogues* of Gregory the Great into Greek. From the 640s to the 750s, a dozen popes were native or near-native speakers of Greek; at least half of them, including Zachary, were of Italian origin or upbringing.

In the later tenth century and the eleventh century, Greek had more visibility in Rome, partly in connection with the activities of the German emperors Otto II and Otto III and of the empress (later, empress mother and regent) Theophano, niece of the Byzantine emperor John I Tzimiskes. Greeks still came on pilgrimage, and there was again Greek monastic settlement in the city, though the evidence for new foundations is thin. A Greek-speaking courtier from Rossano, John Philagathus, who tutored Otto III in the language, held high imperial and ecclesiastical positions in northern Italy. Later he allowed Roman interests to proclaim him pope against imperial wishes (John XVI, antipope, 997-998). At the end of the first millennium the *scola Greca* participated in at least one liturgical procession. And in 1004 Calabrian monks under the guidance of Nilus of Rossano founded what would become the famous Greek abbey of Grottaferrata at Tusculum in the nearby Alban Hills. Among its contributions to Italo-Greek literature are the anonymous *Life of Saint Nilus the Younger* and the canons (long hymns) of the abbey's fourth hegumen, or head, Bartholomew of Grottaferrata (d. 1055).

Sardinia, administered from Africa until the Arab conquest of Carthage in 697-698, was already beyond the effective control of the empire in 733. A few Greek inscriptions attest to the survival of Greek here in secular contexts into the tenth century, and in religious contexts into the eleventh century, when the island's remaining Greek monastic

foundations were taken over by the Latin church. One of the earliest known texts in Old Sardinian, a charter from Cagliari executed between 1089 and 1103, is written in Greek letters; and the word used to denote the island's own eleventh- and twelfth-century form of ecclesiastical register of legal documents, *condaghe*, is Greek in origin (from *kontakion*, "volume").

Similarly, in coastal Campania, where Naples with its dependencies—Gaeta, Sorrento, and Amalfi—became autonomous during the eighth century and the dependencies themselves achieved autonomy in the ninth, Greek scribes are known from Gaeta in the tenth century but not later. In Naples, by contrast, Greek signatures on documents from the ducal period become exclusively clerical or monastic during the eleventh century. Contemporary and later notarial records still refer to local secular "Greeks," but these are thought to be newcomers from farther south rather than descendants of the older Greek-speaking population in the area. In the ninth and tenth centuries Naples had also distinguished itself as a venue for literary translation from Greek into Latin; the surviving works are mainly saints' lives and, in later versions only, the archpriest Leo's rendering of the Greek romance of Alexander. In the tenth and early eleventh centuries, a wave of Greek monastic settlement from the south is observable, especially in and around Amalfi and Salerno but also in the principality of Capua, where the ruling family welcomed it. Nilus of Rossano's sojourn at Valledulio (where most of his surviving poetry seems to have been written) is one aspect of this development; another aspect led to the naming of a Calabrian Greek as abbot of Monte Cassino in 1035.

In Sicily—which was already partly bilingual and where the emperor Constant II Pogonatus made Syracuse his city of residence from 663 until his death in 668—further hellenization occurred from the late sixth century onward. The Arabs' conquest of the island (827-902; Rametta was an isolated holdout until 965) reversed this trend: by the late tenth century, Greek was spoken principally in the northeastern corner of Sicily. The rehellinization of Calabria evidently began in earnest in the seventh century and is thought, like that of Sicily, to have been aided by extensive immigration from other parts of a troubled and shrinking empire. As a result, the southern portion of this region was quintessentially Greek for the remainder of the medieval period. Most

of the extant medieval Italo-Greek literature comes from Sicily and Calabria, and much of it (as indeed much of the literature more generally) is religious in orientation. Notable examples from these regions before the Norman conquest are the eighth-century *Life of Saint Pancratius of Taormina*; the early ninth-century prose *Life of Saint Leo, Bishop of Catania* (a later metrical life is of unknown origin); Theodore the Monk's eyewitness account of the Arabs' capture of Syracuse in 878; the tenth-century *Life of Saint Elias the Younger*, the late tenth-century *Life of Saint Elias the Speleote*; and the surviving verse of the early eleventh-century archbishop Nicholas of Reggio. Literary authors of Sicilian origin active in Constantinople during this time include Gregory of Syracuse (probably late seventh century), who was famous for his *kontakia* (verse homilies); and, in the ninth century, the patriarch Methodius I, the extremely prolific Joseph the Hymnographer, and the secular poet Constantine of Sicily, who wrote in anacreontic and elegiac metres.

In Lucania (northern Calabria, Basilicata, and the southernmost portion of today's Campania), the coastal town of Agropoli ("acropolis") on the Gulf of Salerno owes its Greek name to sixth-century imperial fortification and may still have been nominally Byzantine when it was seized by the Arabs in 882. From the late ninth century into the eleventh, Greek-speaking populations and Byzantine temporal power advanced, in stages but by no means always in tandem, out of southern Calabria and the lower Salentine peninsula across Lucania and through much of Apulia as well. By the early eleventh century, Greek settlement had radiated northward and had reached the interior of the Ci-lento, deep in Salernitan territory. Parts of the central and northwestern Salento, recovered early, came to have a Greek majority through immigration, as did parts of Lucania. Elsewhere in these lands that had recently been or still were controlled by the Lombards, there was a more modest degree of hellenization. An intriguing literary production, probably from the early eleventh century, is a verse admonition to humility carved on a marble plaque; this is now in the cathedral of Bari but—given the grammatical gender of its addressee—it was probably placed originally in a convent of Greek nuns.

This eleventh-century apogee was of brief duration. Between 1040 and 1071, the Byzantine territories in Italy passed effectively into

Norman hands. With the completion in 1091 of the Norman conquest of Sicily, the entire Italian south was under Latin rule. Although Greek-speakers migrated internally, especially in and into Sicily (Messina was quickly rehellenized), further overall enlargement of the Greek linguistic area was no longer possible. Governmental support for the language was limited largely to the continuation of arrangements already in place and, in Sicily, to the replacement of Muslim Arab officials with Greek Christians. Under counts Roger I and Roger II, the chief administrative language in Sicily and Calabria was Greek; when the comital center was moved to Palermo in 1112, the Greek minority there increased in numbers and importance. But the Greek church, subject since the eighth century to the patriarch of Constantinople, was now under the authority of Rome. In Sicily, where almost all episcopal sees had been vacant since the Arab conquest, the new bishops spoke some form of Romance; as the island reverted to Christianity, Latin liturgies and, in time, Latin schooling became normative in non-Greek communities. On the southern mainland, though many dioceses remained in Greek hands, there also began a process of ecclesiastical latinization that would not be concluded until well after the end of the Middle Ages.

At the beginning of the twelfth century, Greek was still spoken in Rome. It was also spoken in Grottaferrata (which was soon to go into a long decline); in a few ports, such as Venice and Naples; in the Cilento; in scattered locales in Basilicata, northern Calabria, central Apulia, and western Sicily; and in its larger redoubts in northeastern Sicily, southern Calabria, and the Salento. Outside the deep south at this time, and for the remainder of the medieval period, speakers of Greek were as a rule either merchants or monastics and were rarely numerous. The famous twelfth-century translator Burgundio of Pisa seems to have learned Greek not in Italy but in Constantinople. Many of the extant eleventh- and twelfth-century translations from Greek into Latin were made by Italians resident in Constantinople. Figures prominent today are John of Amalfi (John the Monk), Moses of Bergamo (Mosè de Brolo; the first westerner since antiquity known to have collected Greek manuscripts on a large scale), Paschal of Rome, the philosopher James of Venice, and the Pisan brothers Hugo Etherianus and Leo Tuscus. For the most part, learned Italians were acquainted with Greek only

through the letters of the Greek alphabet (whose use for numerical notation survived in the medieval west in the computation of ecclesiastical calendars), through individual Greek words encountered in Latin texts, and through occasional remarks on Greek morphology and accentuation derived from ancient sources and conveyed in Latin grammatical writings.

The spoken language had undergone further substantial change. Notarial documents and other texts show that in many respects it was now quite close to modern Greek. Among the more striking developments were the loss of most pretonic initial vowels, including unaccented temporal augments, and the subsequent development of enclitic third-person pronouns (despite their appearance, these derive not from the definite article but rather from forms of the intensive pronoun *autós*); a major rearrangement of noun paradigms away from the distinction between vocalic and consonantal stems; significant modifications in the use of participles; and changes in the perfect and the aorist that foreshadowed the aspectual system of the language as it exists today. The dative case dropped out of general use except in set phrases.

Greek literature from the initial phases of Norman domination in the south (late eleventh and early twelfth centuries) is stylistically modest and reflects a range of attitudes toward the new rulers. Notable are the very different *Life of Saint Nicodemus of Kellárana* and *Life of Saint Philaretus the Younger*, each by a monk named Nilus; the sermons of Luke, bishop of Bova and acting Greek bishop of Reggio; and the anonymous *Life of Saint Luke, Bishop of Isola [di] Capo Rizzuto*. With the creation of the kingdom in 1130 came a flowering of Greek high culture in civil and ecclesiastical contexts. The writers and texts include the brilliant homilist Philagathus of Cerami; *Life of Saint Bartholomew the Younger* (Bartholomew of Simeri, founder of the Patriarchate of Rossano); *History of the Patriarchal Sees*, by the theologian Nilus Doxapatres; an anonymously transmitted long poem (not yet edited) on a variety of subjects, dedicated from a Maltese prison to George of Antioch, chief minister of Roger II; verse epitaphs from the 1140s and 1150s from Palermo for George of Antioch, for his mother, and for his wife, and, from Messina, for the archimandrite Luke; and the poetry of the admiral Eugenius of Palermo (died c. 1203).

During the twelfth and thirteenth centuries, official use of Greek diminished markedly as the kingdom was progressively latinized. The Norman and Swabian kings displayed a Greek acclamation formula on their Sicilian small coins; their chanceries produced Greek documents in varying but usually small amounts until at least shortly before 1250; and Frederick II's Constitutions of Melfi (1231) were issued not only in Latin (*Liber Augustalis*) but also in Greek (*Basilikà Diatàxeis*). These dynasties also fostered Greek learning, so that for a while Sicily was a conduit of Greek scientific, technical, and humane culture into the Latin west: from the translations of Henry Aristippus under William I to those of Bartholomew of Messina under Manfred, the contributions of the kingdom in this regard were numerous and, for their time, noteworthy. In ordinary Romance perception, Greek was either a wholly foreign language spoken by eastern schismatics or, at best, a tolerated minority tongue. Within the still extensive communities of that minority, it remained a vehicle of written as well as oral communication.

Literary creation in Greek declined in Sicily and Calabria after the twelfth century. Some undated hymns to Calabrian saints may be later—as are certainly the anonymous *Life of Saint Cyprian of Calamizzi* and a hymn honoring this saint, a medical doctor and abbot who died no earlier than c. 1210 and under whose name a prayer for healing also circulated. The Salentine peninsula, in contrast, produced several generations of thirteenth-century Greek poets, some of whom were also prose artists. They included Nectarius of Casole (Nicholas of Otranto), John of Otranto (Johannes Grassus), George of Gallipoli, another Nicholas of Otranto (a son of John of Otranto), Theodotus of Gallipoli, and Leo of Gallipoli. The frequent presence in Apulia of Frederick II and his court favored this easterly shift: several of the poets just named held imperial appointments, contributed political verse, or both. But the literature continued even after the Angevin conquest of 1266-1268. A thirteenth-century linguistic compilation of note is a largely unpublished Greek-Latin lexicon (now at the College of Arms in London, MS Arundel 9A), whose south Italian parentage is proclaimed by entries for specifically Calabrian foodstuffs and for the famous icon of Rossano, the Achiropita.

The war of the Sicilian Vespers (1282-1302) proved devastating to the

Greek monastic communities on Sicily. Their archimandrite supported the Catalan dynasty that, contrary to the wishes of the papacy, had supplanted the Angevins here; in retaliation, Pope Honorius IV declared him deposed and his monasteries' holdings forfeit, whereupon the island's Basilian houses were widely despoiled. The treaty of Caltabellotta (1302; ratified by the papacy in 1303) legitimized the division of the kingdom into its separately ruled insular and mainland portions and thereby gave Frederick III (Frederick the Usurper) an opportunity to restore the monasteries to a limited degree. An outstanding act of recovery was the *menologion* (a liturgical book) for Santissimo Salvatore at Messina (now *codices Messanenses Graeci* 30 and 29), probably completed in 1308 and containing numerous ninth-century and earlier lives of Sicilian saints, plus later ones mostly by Sicilian and Calabrian authors. Without this precious, Sicily-focused collection from the mother house of the Greek monasteries in the newly independent kingdom we would have significantly less Italo-Greek religious literature and less information about early medieval Sicily and Calabria than we now do.

Insular Sicily's acceptance of suzerainty over the Duchy of Athens (1311) and its other types of involvement in Greece during the early fourteenth century led to increased Greek immigration, especially to Palermo and Messina, as well as to the importation of Greek slaves. As these new arrivals were subject to official and unofficial pressure to latinize, the net increase in speakers of the Greek language was only temporary; certainly, it did not revive the island's now moribund Greek literary tradition. On the mainland, where both the Angevin monarchs and the feudal nobility followed a pro-Latin administrative and cultural policy, ancient and medieval Greek literature was still read and copied, but at greatly reduced levels. Also of the early fourteenth century is the last medieval Greek poet from the Salento of any note, the epigrammatist Drosus of Aradeo. The linguistically and politically isolated Greek communities of the south seemingly could no longer sustain significant literary creation. In their libraries, though, they preserved a rich and often unique patrimony.

Until the mid-fourteenth century, Greek-speakers could also be found occasionally at the Angevin court in Naples. Here some translations, especially of medical works, continued to be made under

royal patronage. Noteworthy in this regard are Moses of Palermo, in the late thirteenth century; and, in the fourteenth century, Nicholas (of Deoprepus) of Reggio, renovator of the medical curriculum at Salerno. At Naples, too, almost certainly in 1339, the early Florentine humanist Boccaccio encountered Greek in the person of Barlaam of Seminara, a Calabrian monk and a theologian based in Constantinople. Boccaccio met Bar-laam through the good offices of the court librarian, Paul of Perugia. Barlaam's more controversial positions were declared heretical at a local council in Constantinople in 1341, whereupon he moved, again passing through Naples, to the papal court at the French city of Avignon. There the curia contracted with him for a series of lessons in Greek; and there, in 1342, the pioneering humanist Petrarch attempted to learn the language from him. These tentative contacts mark the beginning of what would become the humanist practice, stimulated by ancient Latin evidence for the importance of Greek culture, of promoting the study of Greek as part of a broader program of educational reform.

Later, in the winter of 1358/59, Petrarch became acquainted in Padua with Barlaam's student and fellow Calabrian, Leontius Pilatus. At Boccaccio's urging, Leontius was given a chair of Greek at the university of Florence; this post lasted from 1360 until 1362 and enabled him to produce Latin translations of Homer and other ancient Greek authors. In 1368 Petrarch advised a young man wishing to study Greek letters to travel to Calabria, identified in part as the home of the late Barlaam and of Leontius (also now deceased). Barlaam had in fact been made bishop of Gerace in 1342 and was succeeded in that post from 1348 to 1366 by another Greek-speaker, Simon Atumanus. In the late 1370s and early 1380s Simon would teach Greek in Rome, which was then once again papal. But the student's own reported intention to go to Constantinople may more accurately reflect whatever general perception existed in Italy as to the optimum venue for such learning. Only at the very end of the century did ongoing Turkish territorial conquests and other considerations initiate the Hellenic diaspora that in time revitalized Greek studies, first in Italy and then elsewhere in the west.

Greek Orthodoxy in Italy

This essay is about the literary, cultural, and monastic aspects of Greek Orthodox spirituality in Italy from c. 408 (sometimes given as the year of the death of Theodosius I) to 1054; after the latter date, Greek Orthodoxy and Italy went different ways. Greek spirituality is more than the presence of Greek culture, which could be reasonably identified with Greek monks living in Italy, their liturgy, and Greek

manuscripts found in Italian depositories. Rather, Greek spirituality in medieval Italy can be understood as the presence of Greek religious thought and manners, translated into Latin and appropriated by Italians. In this sense, Greek spirituality is much more pervasive than the material presence of Greek people or books written in Greek, and Greek thought was most influential when translated and appropriated in the west.

This essay is also based on a conviction—or prejudice—that primary sources such as manuscripts and ancient libraries, or catalogues of libraries, are our main evidence for the past, and that pronouncements by scholars, brilliant and renowned as they may be, are not definitive. Accordingly, the discussion here relies on work (by figures such as Berschin, Bischoff, Courcelle, Siegmund, and Traube) that involved detailed study of the manuscript transmission of Greek texts in the west.

It seems simplistic, as well as unwarranted, to consider translations from Greek to Latin of works of spirituality as evidence of the "pervasive cultural economic influence of Byzantium" (Brown 1929, 342). For one thing, there is not a shred of evidence that interest in Greek works of spirituality—broadly defined as conciliar documents, biblical exegesis, and lives of saints—and their translation followed the economic fortunes of Byzantium. Second, Greek culture in Italy was not necessarily imported from Constantinople. In early times, Antioch and Alexandria played an important role, and southern Italy had been for centuries a crossroads between Greek and Latin culture, so that much "Greek" material, although indeed Greek in origin, is of southern Italian provenance. An example is *The Life of Saint John the Almsgiver* translated by Anastasius Bibliothecarius, who informs us that he found the Greek original "in the Greek library." This library may have been at Constantinople, where Anastasius spent some time; but it may just as well have been in Rome, where Anastasius spent most of his life and where there were several Greek libraries.

A similar case in point is the Lateran Synod of 649, held in Rome, which provides an impressive list of Greek works. In the nineteenth century, G. B. De Rossi reasoned that, since this synod took place in Rome, all the Greek works cited in its proceedings must have been in the Lateran library at the time, and he wrote a learned essay on the

subject. However, we know from the synodal acts that thirty-eight Greek monks came to Rome specifically for the synod, and some scholars believe that the Greek works cited came to Rome with those monks. The truth is somewhere in between—where, precisely, remains to be seen. "Greek," then, could mean "belonging to the Greek community in Rome" or "from Constantinople," but it could also mean "from southern Italy" or "from anywhere under Byzantine jurisdiction." Therefore, "Greek" meant Greek culture wherever it might be found. As Irigoien noted (at the Twentieth International Congress of Byzantine Studies, held in Paris in 2001), the transmission of Greek texts shows that southern Italy was a cultural area extending from Sicily to Naples. On the other hand, in Rome Greek monks formed, for centuries, a distinct cultural community.

Because Greek culture was conveyed in two ways—through direct contact with the east or with Greeks in the west, and as part of a native bilingual and bicultural tradition—its continuity was ensured. Direct contact with Constantinople might be intermittent, depending on political whims and on the comings and goings of individuals; but Greek books were always present, thanks to the local Greek culture. Years might pass between the issuance of a work in the east and its translation and impact in the west. The translation of material pertaining to the Council of Ephesus (431) is an example. The doctrinal dissent that led to the council was debated in the east: Cyril, who adhered to the received doctrine of the church, was in Alexandria; Nestorius was in Constantinople. When Cyril contacted Pope Celestine I, the response was clear: Celestine sent legates not as observers but as judges, to whom he had delegated the power of the keys. They acted accordingly, and the council did leave some tangible marks in Rome: the Nativity cycle of mosaics in Santa Maria Maggiore is the visual expression—a witness to faith and a teaching tool for the unlettered—of the council's dogmatic definition of Mary, mother of God (*dei genitrix*), a translation of the Greek *theotokos*. It implies not that God, who is eternal, can ever be born, but that Mary gave birth to the infant Jesus and that the infant was both God and man. The sarcophagus of the Maccabees in San Pietro in Vincoli attests to the influence of the eastern style at this time. Very shortly after the Council of Ephesus, its documents were translated into Latin by Marius Mercator, an African

disciple of Saint Augustine. Yet his translation was not widely known in the west, and the council's documents did not have their full impact in the west until they were published in a new translation by Rusticus, nephew of Pope Vigilius, in 564-565.

The transition of theological thought from east to west and from Greek to Latin was, then, an ongoing process. Most important, the reception of Greek culture in the west involved appropriation and assimilation and was not random. Some texts (but not others) were chosen deliberately, for specific reasons, and became popular: Greek works of spirituality were chosen for translation in so far as they contributed to the knowledge of faith in the west. The *deposition fidei*, the tradition of faith handed down from apostolic times, was the same for east and west, but language and culture were different. A determination to preserve the unity of faith contributed to cultural unity, for Greek works were translated and disseminated in the west; in fact, Greek theological thought was in the lead. Conversely, periods when no unity of faith was recognized—the Iconoclastic period, the postschism period—were culturally less productive for Greek spirituality in the west.

The two principal modes of transmission of Greek spirituality were doctrine, expressed in theological and exegetical works, particularly canons of councils; and moral teachings, set out in the form of monastic rules and presented in practice through lives of the saints, the living examples of spirituality.

Beginning in 323, there were twenty ecumenical (general) councils. Those held in Greek territory were: Nicaea (325), which affirmed the divinity of Christ against Arius and debated the doctrinal issue of Easter; Constantinople (381), which affirmed the divinity of the Holy Spirit; Ephesus (431), which defined the divine maternity of Mary and the union of divine and human nature in Christ; Constantinople II (553), which confirmed the first four councils; Constantinople III (680-681), which affirmed human and divine will in Christ; Nicaea II (769), which considered the veneration of the holy images; and Constantinople IV (869-879), which dealt with the legitimacy of the patriarch of Constantinople.

Except for Ephesus, the first eight councils were held in or near Constantinople; the later councils were held in the west. Accordingly,

proceedings and resolutions (canons), the preparatory documents, and the commentaries were in Greek, and belief in a church universal by definition ("Go ye and preach the Gospel to all creatures," Mark 16:15) found expression in Greek thought and language. The first four councils were considered fundamental; the principles stated in these four councils were reaffirmed by the fifth and sixth. The veneration of images, central to the seventh council, presupposed that Christ could be represented in his humanity; on the other hand, to venerate the image of a lamb would be considered silly if the lamb did not signify a reality beyond human experience. Thus the cult of images presumed that human and divine nature, though distinct, were united in a mysterious but real way.

The canons (rules or decisions) of the councils included disciplinary matters as well as dogmatic definitions. Canon law is found in manuscripts much more frequently than dogmatic definitions, because discipline was a more frequent practical concern than dogma; however, the primary preoccupation was dogma, not discipline. This was the reason for the arrangement usually found in the acts of councils: first the dogmatic definitions, then the disciplinary measures. Dogma came first because it was for everybody and because without a clear perception of the truths of faith there could be no belonging to the church and no salvation; disciplinary measures came second because they were aimed at wayward clerics. Thus Dionysius Exiguus, in his preface to the *Synodicon* of Cyril of Alexandria, wrote that his work was meant to "make faith known." Chronologically, his translation was not the first, but he was more concerned than the previous translators with the precise formulation of dogma; to that end, it included citations from the gospels, thus linking the definitions of the third council to the faith of the apostles.

The dogma that transmitted eastern thought to the west was to last: the definitions formulated at Ephesus and Chalcedon are still with us. However, they remained dormant in the west for several centuries; indeed, as some scholars have observed, the dogma proclaimed at Ephesus did not permeate Christology in the west until Thomas Aquinas appropriated it. This is certainly a long time, and it took almost as long for Aquinas to be recognized by Pope Leo XIII as the official theologian of the Catholic church. Nevertheless, when such recognition

finally came it was given not only to Aquinas as an individual theologian but— more important—to the theology of Nicaea, Ephesus, and Chalcedon as perennially valid. It acknowledged the seed sown at the Greek councils and the work of translators that had brought the seed to fruition in the west. In our own time, Pope Pius XII felt a need to reaffirm the principles of Chalcedon in his encyclical *Sempiternus Rex*; and in 1994, addressing an academic audience, Leonard E. Boyle, O.P., restated the perennial paradox of Christianity as a down-to-earth religion unafraid to admit that we are human, have a body, and worship not only in spirit but bodily, and yet a religion based on faith in an unseen God who is in every respect an absolute, transcendent "other."

Nicaea and *Computus Graecorum*

The Council of Nicaea was convened before the period covered here, and its proceedings as such were not preserved, although the *Symbol* (which gained universal acceptance) and the canons (disciplinary in nature) were. There was one issue whose importance was not felt in Italy until much later: the proper celebration of Easter according to the Alexandrian cycle, known in the west as the *computus graecorum* (*computus* of the Greeks). The common translation "Easter reckoning" is probably the best available; however, it is misleading because it evokes the complex and esoteric calculations that were indeed necessary, if the day of the full moon after the spring equinox was to be determined in advance, but were not the primary concern of those involved in the debates. The calculations were originally Egyptian and had no Christian connotations; they were only a means to a end, intended to establish a memorial to the resurrection of Christ, the central event in the church calendar and in Christian belief. The mathematical details could be left to the experts; the primary issue was theological and of universal import—hence its centrality at Nicaea.

Contrary to widespread belief, the connection between the Council of Nicaea and the celebration of Easter according to the Alexandrian cycle is not only well attested to historically but also strictly logical. Eusebius's *Life of Constantine* tells us that Nicaea was concerned with

Easter, Logically, a council summoned for the purpose of affirming that Christ is God would also make sure that the celebration of Easter conveyed the same message: the resurrection, which is proof of the divinity of Christ, occurred on a Sunday; Easter, the memorial of this resurrection, should therefore also be celebrated on a Sunday and not on any other day. Just as logically, the council's deliberations concerning Easter were placed immediately after its deliberations on Arius—in the section on dogma, not with the canons in the section on discipline. To repeat, the mathematical calculations were delegated to the experts, who had learned them from the Egyptians; but although the reckoning was pre-Christian, the principles underlying it were Catholic. Concern for unity among churches was real, as we learn from Eusebius, but unity was not a consensus to be reached through compromise, democratic processes, or "ecumenical spirit." Unity meant the integrity of faith and the assent of all the faithful.

Thus the difference between the Christian and Jewish celebrations involved not merely the date but belief in Christ as God and man. Easter was not Passover. The Alexandrian bishop Proterius, in a letter to Pope Leo I, summed it up as follows: the Jews do not know Christ; therefore they do not know Easter. The fragments of the Nicaean council preserved in *Acta Silvestri* underline this difference between Christians and Jews.

To follow the "Alexandrian Easter reckoning" in Italy is to follow the inroads of Greek theological thought and spirituality in the matter most important to a believer: the proper theological understanding of the person of Christ. Such understanding was accepted in the west not because it was the fruit of Greek spirituality but because it was considered true, and grounded in the apostolic tradition. Still, the conveyors of this apostolic doctrine were Greek thinkers who wrote in Greek. A long effort of translation and interpretation was necessary before their work entered the mainstream of theological thought and spirituality in Italy.

The Easter reckoning in Italy is mapped out by a calendar published in *Monumenta Germaniae Historica* (AA IX), which contains the Easter cycles and the names of Roman and Byzantine emperors from the beginning of the Christian era to c. 800. Also noted are the milestones of Greek *computus*: the Council of Nicaea, which made it mandatory

for the whole church; Theophilus, bishop of Alexandria, who recommended it in a letter to Emperor Theodosius; Proterius of Alexandria, who explained it in a letter to Pope Leo I; and Dionysius Exiguus, who translated Proterius's letter in Rome in 525. Dionysius summed up Greek theology for the Romans, patiently explaining the theological reasons underlying the date chosen for Easter. He added one innovation, for which he is remembered today, by counting the years from the day of the incarnation (the annunciation of the angel to Mary, celebrated on 25 March) in a conventional year 1. After his death, the Easter dossier was disseminated from Vivarium, the monastic foundation of Cassiodorus in Calabria, for Romans and others. In 616, Felix of Squillace continued the work of Dionysius and Cassiodorus, but it took many years for the *computus graecorum* to become firmly entrenched in Italy and the west.

The Ecumenical Councils and Italy

In Italy, the impact of the first four councils was not immediate; there was a significant time lag between the councils and the dissemination of the pertinent acts. The proceedings of Nicaea I and Constantinople I have not survived; the canons of Nicaea are found most often in the edition of Dionysius Exiguus, almost 200 years after the council; those of Chalcedon also became known in Italy through Dionysius. The dossier of Ephesus gained popularity through the edition of Rusticus (564-565), together with Constantinople II. The canons were also disseminated through Dionysius.

This is not to say that there were no earlier translations. There was a contemporary translation of the Ephesus dossier by Marius Mercator, and the acts of Chalcedon were translated considerably before Dionysius; but, as far as we can tell from the manuscript transmission, they had little impact on Italians until Dionysius and his supporters—first Pope Hormisdas and later Cassiodorus—appeared on the Italian scene. One reason may have been a lack of theological acumen among Romans. An episode related by Boethius in his dedication to Mercurius is indicative: when certain Greek monks in Rome expounded their doctrine before a distinguished audience that included Roman senators,

there was general agreement with the monks' assertions—except from Boethius. Apparently, Boethius was the only person in the assemblage who realized what the monks were saying; and he proceeded to write a treatise in which tried to make the subtlety of Greek speculation understandable to the Romans. The almost contemporary editions of the canons by Dionysius were a response to the same need to educate Italians in the theology of the east; and the fact that there were two editions and a projected bilingual third edition tells us that this need was real. Cassiodorus propagated Dionysius's translation of the canons from Vivarium, as he had done for the Alexandrian *computus*. Rusticus, who was well aware of Cassiodorus's efforts, also labored to make Greek theological thought better understood. The dissemination of such material took on momentum in the sixth century, and Greek spirituality in Italy flourished along with it. In the seventh century, there was no time lag in the dissemination of the proceedings of the sixth council; and the Lateran Synod of 649 was the work of Greek monks led by Maximus the Confessor and sustained and ratified by an Italian pope. "One in language with Constantinople, one in faith with Rome," said Maximus. However, there was a price to pay for unity of faith and respect of cultural identity; both Maximus and Pope Martin died as martyrs; and although the year 680 was hailed in Rome as the beginning of a new era, the Iconoclastic struggle was soon to follow. The next flourishing of Greek spirituality in Italy would be in the ninth century, with Anastasius Bibliothecarius, and at that time works of hagiography would come first.

Exegesis

Canons and acts of councils were not meant for a wide audience, and the number of extant manuscripts is relatively small. Yet if direct reading was limited to clerics and lawyers, the principles involved were basic tenets of the faith, required of all believers, and were conveyed to the whole church. Works of exegesis by the Greek fathers were not the official teaching of the church and thus did not reach the faithful in the pews; these works were aimed at a more specialized audience (mostly monks), who used exegesis in their daily meditation on the scriptures.

Patristic exegesis was not as widely translated in Italy as hagiography (lives of saints), which was immensely popular. Often, it is difficult to determine when and where exegetical works began to become known, since most of the translations are by anonymous monks and were intended for their fellow monks. Authors and works that can be securely assigned to Italy include Basilus (monastic *Rule* and *Hexaemeron*), who influenced the rule of Saint Benedict and thereby all of western monasticism; Athanasius (various letters, attested to in Rome and in the works of Lucifer of Cagliari) and the *Symbol*; Dionysius Exiguus, who translated Proterius's letter to Pope Leo and Gregory of Nyssa; Isidore of Pelusium, whose letters were partially translated by Rusticus for his edition of the councils; and *Verba seniorum*, an influential collection of maxims attributed to the desert fathers, translated in Rome by Pelagius and Iohannes Subdiaconus (later popes Pelagius, r. 556–560; and John III, r. 560–573).

By far the most important translations of Greek exegesis came from the team of Cassiodorus (Squillace, second half of the sixth century) and from Anastasius Bibliothecarius (Rome, late ninth century). The continuity between Cassiodorus and Anastasius is very real: for both scholars, translations from the Greek were not isolated but were part of a stated program. Cassiodorus, like his master Dionysius, intended to make Greek spirituality better known among Italians; Anastasius undertook the additional effort of rewriting in cultured Latin pieces that had already been translated but that contained errors or lacked literary polish.

Cassiodorus, with his friends and associates Bellator, Mucianus, and Epiphanius, continued from Vivarium the work that Dionysius Exiguus had begun in Rome. They were responsible for the translation of John Chrysostom (*Omilia ad Hebraeos*, translated by Mucianus); Clement of Alexandria (*Adumbrationes*); Didymus (*Commentary to the Proverbs*, translated by Epiphanius, and that on *Catholic Letters*); Origen; and Philo of Karpasia (*Commentary to the Song of Songs*, attributed to Epiphanius of Cyprus). *Historia tripartita*, so called because it was derived from three eastern theologians—Socrates, Theodoret, and Sozomen—was also a history of faithfulness to belief handed down in the church.

Anastasius Bibliothecarius quite deliberately continued the history of

fidelity to Catholic belief with his *Ecclesiastical History*. Though he is better known for his translations of the seventh and eighth councils and of hagiographical works, Anastasius rendered into Latin the *Vita mystica* of Maximus the Confessor and glosses to Maximus's works.

Hagiography

The second mode of transmission of Greek thought was spirituality in action, both in the collective life of the church and in the individual lives of monks and ascetics. This doctrinal and moral content, constituting a well-defined *corpus*, cannot be diluted in social history, *histoire* of the *mentalités*, or history of any other kind. It found expression in Greek before it was conveyed to the west in a Latin translation. Greek monks were also personally present in the west, for instance at the Lateran Synod of 649, where they had an essential role as carriers of theological thought. Though comparatively few in number, Greek monks in Rome constituted for centuries a distinct and visible entity and contributed to the life of the church in the west through their liturgy and their libraries. Basilian monks also had convents throughout southern Italy, as well as near Rome. Most often, though, Greek monks were present in a way that transcended time and space—through their holiness and their writings, and in writings about them.

Hagiography is the account of lives of saints: first martyrs (individuals who gave up their lives rather than deny their Christian belief) and then monks (who had given up the world and its pleasures to serve God in a monastery or in the desert). These figures were held up to the faithful as examples of what could be done in the service of God, and their miracles were recounted as tangible proof that these saints existed and were a source of help. The enduring legacy of Greek spirituality to Italy and the west was a model of the saint: an ascetic, living apart from the world in a monastery or in the desert, devoted to prayer and the study of the scriptures, working with his hands to provide for the basic necessities, compassionate toward his fellow men, and ready to leave his cell to save a soul. (The story of Abraham and his niece is an exemplar.) In Italy this model was to last until the Mendicant orders came along—only then did the friars go out to preach

where the crowds were thickest, and, as one friar said, their convent was the world.

The number and variety of lives of saints that are of Greek origin are extraordinary, but it is often difficult to determine the dates and places of origin of the translations. Not surprisingly, most *vitae* (lives) that are securely attributed come from southern Italy, which was always a crossroads of the Greek world and the rest of Europe. Significantly, although Cassiodorus included lives of martyrs in his list of suggested readings, Pope Gregory I a few years later could find very few lives in Roman libraries. The best indicator of the vitality of Greek lives of saints is their survival in various vernacular legends. These lives were popular—a term which suggests not that they were superstitious or subliterate (on the contrary, they were a literary genre with its own stylistic requirements), but simply that they were widespread among the people. They conveyed in very practical terms the same doctrinal message as biblical exegesis and the canons and definitions of the councils. We know this from the number of manuscripts that are extant or attested to.

The first immensely popular *Life* was that of Saint Anthony, written by Athanasius and translated by Evagrius toward the end of the fourth century. Later on, Dionysius Exiguus (*Life of Pachomius*, *Poenitentia Thais*, and *Inventio capitis Iohannis Baptistae*) and Anastasius Bibliothecarius were the most influential translators. In his preface to the life of Pachomius, Dionysius proposed the life of a desert monk as a model for the Romans, thus establishing a pattern that would last for centuries. Anastasius rewrote many Greek lives in a style suitable to an educated Latin public. Among his translations are *Passio Acacii*, *Passio Clementis*, *Miracles of Demetrius*, *Life of Sophronius*, and *Life of Basilus*. "Bonifatius Consiliarius," who was active in Rome, translated *Passio Theodori* and is probably to be identified with the adviser (*consiliarius*) of Pope Sergius I.

In Naples, from the end of the ninth century through the tenth century, there was an active group of translators: they included Guarimotus (*Life of Saint Eustrathius*), John the Deacon (*Acta Febroniae*, *Life of Nicholas*), and Paul the Deacon. In the eleventh century John the Monk (from Amalfi) translated the *Pratus spiritalis* of John Moschus and *Passio Irenis*. Other, anonymous translations include

the legend of the Seven Sleepers, the legend of Saint George, *Inventio Stephani*, *Passio Mercurii* (from Beneventum), *Passio et miracula Demetrii*, and *Life of Saba*, which can be reasonably attributed to the monks of San Saba in Rome.

Greek Monasticism in Italy and the Liturgy

Finally, there was the physical presence of Greek monks in Italy. In Rome, they were particularly influential for their liturgy, which is a concrete communal expression of spirituality: *lex orandi, lex credendi* ("the way we pray is the way we believe"). Greek monks introduced many feasts of saints to Italy, as well as many church buildings; but (apart from Rome) it is often difficult to quantify such contributions or to provide proper documentation and chronologies.

This is especially true of the Basilian monks. According to local tradition, their presence in southern Italy was universal, and typing into a search engine "Basiliani + Italia" will yield every hamlet that claims the legacy of Basilian churches or convents. However, actual records are scant before the Norman period, and the assumption that the Basilians came to Italy as refugees during the Iconoclastic period would need further documentation. There are many valuable studies devoted to particular Basilian monasteries or areas; but the documents that could tell us precisely how long the monasteries were active in a given area, how many monks they included, and how much land they possessed are still for the most part awaiting publication in the Vatican Archives. The publication of the *Bullarium* of Piero Menniti—a collection of papal and imperial documents and privileges and diplomas granted to the Basilians in Italy to the year 1707—would be particularly important. There is a posthumous draft, with a detailed outline of the planned work, in the Vatican Archives. Until that and other written sources are published, we have to concur with Paul Arthur's evaluation of archaeological discoveries: tradition abounds, but evidence for the pre-Norman period is scarce. For the Basilians in Italy, as for the many texts attested to in various manuscripts but not yet situated in place or time, there is still plenty of work to do to bring the riches of Greek spirituality in Italy to light.

Gregorian Chant

Gregorian chant is music for the liturgy of the Roman Catholic church, consisting primarily of biblical texts set to monophonic melodies that vary widely in style and scope. Chants are provided for major feasts and ordinary Sundays of the liturgical year (the *temporale*) as well as for saints' days (the *sanctorale*). Pieces with unique texts and melodies for the mass—called "proper" chants—include the introit, gradual, alleluia, offertory, and communion. The chants of the "ordinary" consist of invariable texts and a limited number of melodies: these are the Gloria, Credo, Sanctus, and Agnus Dei. The repertoire for the eight canonical hours of the divine office consists primarily of hymns, antiphons, and responsories; the last of these are closely allied with the liturgical readings of matins.

Wagner's general means for differentiating the various Gregorian melodic styles was formulated nearly a century ago and still remains a useful preliminary tool for analysis and comparison. Wagner frequently categorized the melodies according to the relationship between tune and text, specifically by the number of notes applied to individual

syllables. "Syllabic" melodies consisted for the most part of one or two notes per syllable; "neumatic" melodies had up to five notes per syllable; "melismatic" melodies were highly ornate, with long flowing passages and multiple pitches applied to single syllables. Wagner's three categories can be applied, with some consistency, to the various liturgical genres described above. Office antiphons are largely syllabic melodies; introits, communions, and office responsories are often neumatic; and the graduals and alleluias of the mass are frequently virtuoso melodies with highly decorated lines.

The early theorists categorized the Gregorian melodies according to a more abstract model that facilitated the memorization of the repertoire during its dissemination before it came to be notated. The earliest testimony to this system is preserved in books called tonaries. These sources organize large portions of the chant repertoire according to varied but interdependent means of categorization. Melodies may be grouped, for example, according to their final and opening pitches, in sets of melodic families, and according to their use of specific scale segments that differ in the arrangement of half steps and whole steps. Carolingian in origin, this system of the ecclesiastical modes consists of eight primary pitch sets (*manneria*) organized around four focal tones, which may be thought of as the pitches d, e, f, and g (*protus*, *deuterus*, *tritus*, and *tetrardus*, respectively). These tones, called *finals*, were often the opening and concluding pitch of a chant of a given mode, and they were frequently a point of melodic attraction throughout the life of a melody. Each of the four *manneria* was further subdivided according to the general range of a given melody. Pieces that dwelled primarily within the octave above a given final were considered "authentic" and were sometimes referred to numerically as modes 1, 3, 5, and 7. Melodies that traversed the fourth below the finals and remained for the most part a fifth above it were called "plagal"; these were modes 2, 4, 6, and 8. Though the sources for this system were highly speculative in nature, the impetus for the Carolingian modal system was purely practical: some way of prodding the memory was necessary, in the absence of a written record; and some way was also needed to properly connect the conclusion of a verse melody (sung to unvarying recitational formulas) with the beginning of a unique melody.

The existing manuscripts containing the texts and melodies of the

standard Gregorian corpus are all non-Roman in origin. The earliest complete books contain only the texts for the mass proper; six of these are indexed in Hesbert's indispensable *Sextu-plex* (1935). The earliest notated sources date from the ninth century. The musical notation found in these sources varies considerably in terms of orthography, though regional families of writing styles are clearly in evidence. The signs themselves consist of various dots and strokes called neumes, though their notation in the earliest sources gives little information regarding specific pitches (*in campo aperto*) and cannot be transcribed directly without reference to later "heighted" manuscripts copied with staff lines.

Aside from these northern sources, there are five notated books that were copied in Rome itself, including three manuscripts for the music of the mass and two for the divine office. All are of a comparatively late date, ranging from the eleventh to the thirteenth centuries. The feasts, liturgical assignments, and texts that they contain are nearly identical to the earlier non-Roman books, and their melodies are most often clearly related to the Gregorian corpus. Yet the Roman settings are often highly ornate in comparison with the more familiar versions copied in northern sources.

Finding an explanation for these melodic differences was described as the "central problem of Gregorian chant" (Apel 1958), and this problem has continued to be a major topic in the secondary literature. In general, it may be said that both melodic dialects—the "Gregorian" (i.e., Frankish) and the Roman (i.e., "old Roman")—are descended from a common melodic fund. Which of these two traditions might better reflect the state of the melodies in the mid-eighth century, when they were first taken over by the Franks, is a matter of debate. Since both redactions originated without the benefit of notation, the degree to which orality influenced the shape of the Gregorian and old Roman repertoires as they are preserved in the sources is also an open question.

Until quite recently, the term "Gregorian" reflected a belief that the chant had been organized and edited by Gregory the Great (d. 604). Gevaert (1890) called this into question, noting that the brief biography of Gregory I in *Liber pontificalis* makes no mention of his interest in or impact on liturgy or music. The biography of Gregory II (r. 715–731), however, is replete with such details, as is that of his successor Gregory

III (731-741); Gevaert therefore suggested that the Gregorian legend more likely referred to them. His thesis was harshly criticized by the primarily clerical scholars who dominated the study of chant at the beginning of the twentieth century, and many of them continued to assume Gregory I's authorship as a given. Considering the huge corpus that constitutes Gregorian chant, it seems reasonable to suppose that the creation, codification, and preservation of this music would have depended on dedicated and long-standing institutional support and a vibrant ecclesiastical milieu—requirements that were decidedly not met in the sixth century. Recent scholarship has suggested that a more likely span of time for the creation of the main body of Gregorian chant was the late seventh century to the early eighth, though of course what survives in the written sources comprises chronological strata reaching both before and beyond this period.

Southern Italian sources of Gregorian chant frequently contain evidence of great antiquity—evidence that is not found in northern books—including features that disappeared elsewhere as early as the eighth century. Examples of these features are the use of the Roman psalter for introit verses (as opposed to Jerome's "Gallican" version used from the time of Charlemagne on); dependence on an earlier lectionary for the gospel readings on the Sundays after Pentecost; the use of two graduals for Saturday in the fourth week of Lent, which is matched in the oldest lectionaries but which was apparently abandoned elsewhere by the early ninth century; and the absence of the mass for the seventh Sunday after Pentecost: the mass is also missing in early documents for the Roman tradition but routinely appears elsewhere in the Gregorian tradition.

Gregorian Reform Movement

See Gregory VII, Pope

Gregory I, Pope

Pope Gregory I (Gregory the Great, c. 540-604) is one of the most notable personalities in the early church. The defining characteristics and organization of the medieval papacy, and indeed of modern Catholicism, owe their foundations to Gregory. His legacy includes associations with major liturgical and musical developments, so much so that the music of the Catholic church is named for him—Gregorian chant. He is also remembered, among numerous other accomplishments, for sending Saint Augustine of Canterbury to evangelize the British Isles.

Early Life

Gregory was descended from the senatorial nobility in Rome. His father, Gordianus, was a wealthy patrician of the famous *gens* Amicia and owned large estates in Sicily and a mansion on the Caelian Hill in Rome. Gregory's mother, Silvia, also was of good family; she is celebrated as a saint on 3 November, and her two sisters were canonized as well. Little is known of Gregory's early education, but he was, according to Gregory of Tours (538-594), unsurpassed in Rome in grammar, dialectic, and rhetoric. The religious atmosphere of his childhood—a time when, John the Deacon tells us, he was like a saint among saints—gave him an solid grounding in the scriptures. His rank and position certainly indicated that he should embark on a public career. Our first record of him is in 573, when he became prefect of Rome at age thirty. Though this office was not then as prestigious as it had formerly been, it was still the highest civil dignity in the city. Soon after achieving this honor, however, Gregory gave up his office and the

tenor of life and became a monk, c. 574. His estates were donated to the church, and his mansion on the Caelian Hill became a monastery devoted to Saint Andrew.

Monastic Life

From 574 to 578, Gregory lived as a monk in Saint Andrew's, probably following the rule of Saint Benedict. In his own writings he describes this as the happiest time of his life. In 578, Gregory—against his will—was ordained by the pope and was sent as the pope's ambassador to the court of Byzantium. Since the Lombards were advancing toward Rome, the pope needed the help of Emperor Tiberius, and this crisis required Gregory's political acumen. For six years, Gregory endured the worldly court at Byzantium, adhering as much as possible to his monastic regimen. It was during this time that he wrote his *Morals* on the book of Job, after meeting Saint Leander of Seville. A dispute arose between Gregory and Eutychius, the patriarch of Constantinople, on certain aspects of the resurrection. Gregory's mission was a failure, and he learned from it that Rome could no longer count on help from the eastern church. Gregory's subsequent course of action as pope would determine the policy of the western papacy toward Constantinople throughout the Middle Ages.

Around 585-586, Gregory returned to Rome and Saint Andrew's monastery, where he was elected abbot soon afterward. During this time, his *Morab* was published and distributed. Gregory's famous encounter with English slaves in the Roman Forum also happened during this period. As a result of his renown, he advanced to become chief adviser, assistant, and secretary to Pope Pelagius II. A letter by Gregory to the schismatic bishops of Istria still survives from this time; as a treatise, it gives hints of his skill as a writer and theologian.

The year 589 brought disasters throughout Italy. The Tiber overflowed its banks, and indeed there were floods in the entire peninsula. A plague swept through Rome, leaving the city full of corpses and virtually deserted by the living. When Pope Pelagius II died in February 590, the clergy and people of Rome were unanimous in their choice of Gregory as his successor; but Gregory, who did not want

to be pope, wrote to Emperor Maurice asking him not to confirm the election. While waiting for a reply, Gregory was called on to lead a sevenfold procession through Rome, praying to God to end the plague. The legend that the archangel Michael himself was seen stopping the plague reinforced the belief among the Romans that Gregory was God's elect, and when the emperor confirmed their choice Gregory was consecrated pope on 3 September 590, despite his protests.

Gregory's Pontificate (590-604)

The papacy proved to be a considerable strain on Gregory's health; he suffered constantly from indigestion, fever, and also from gout during the later years of his life. It is remarkable how much he accomplished despite his infirmities. The short work *Liber pastoralis curae* (*Book on the Office of a Bishop*) was published by Gregory at the beginning of his pontificate, and he adhered to it closely. One of his first acts was to replace the laypeople in the Lateran palace with clerics; and since no *magister militum* lived in Rome, he also assumed command of all military matters in the city. He instituted the "stations" still observed today and recorded in the missal.

There is some disagreement on the extent of Gregory's reforms of the Roman liturgy, but he did make the following modifications:

1. He ordered the paternoster (Lord's prayer) to be recited in the canon before the breaking of the host.
2. He prohibited the use of the chasuble by subdeacons assisting at mass.
3. He inserted the words *diesque nostras in tua pace asponas, atque ab aeterna damnatione nos eripi, et in electorum tuorum iubras grege numerari* in the canon of the mass.
4. He provided that the alleluia should be chanted after the gradual except during paschaltide (the period following Easter).
5. He forbade deacons to perform any of the musical portions of the mass other than singing the gospel.

Pope Gregory I. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle).
Nuremberg: Anton Koberger, 1493, p. 148r.

Gregory was a peerless manager of the vast estates owned by the church: the yearly income from its landholdings in Africa, Sicily, and Campania—well over 1,300 square miles (3,380 square kilometers) all together—has been estimated at more than \$1.5 million by today's standards. He appointed clerics as his rectors, teaching them how to provide detailed accounts and reports concerning their districts.

Even though much of Italian territory was in the hands of the Lombards and their Arian clergy, Gregory tried to care for the needs of the faithful in these dioceses whenever an opportunity arose. On the islands near Italy, of which Sicily was the largest and most important, he maintained and strengthened the existing church structure. Local synods on a regular basis were strictly enforced, and Gregory's many letters attest to his concern for this practice. He approached the filling of bishoprics in a disciplined way, enforced the celibacy of the clergy,

maintained the exemption of clerics from lay tribunals, and did not hesitate to deprive clerics of their holdings and offices if they were guilty of criminal or scandalous offenses.

It is well documented that Gregory maintained, strengthened, and extended the powers, privileges, and jurisdiction of the head of the Roman see over all other Christian churches. In fact, Gregory's claim that the Roman see had supreme authority over the church universal was the basis for the primacy of the papacy in the medieval period and in modern times. The title of ecumenical bishop assumed by the patriarch of Constantinople was brought up for debate by Gregory at a synod held in 588. His manner toward all bishops and patriarchs, western or eastern, was cordial, despite his differences with the eastern church.

In his relations with the Lombards, Gregory worked hard to achieve a lasting peace. Authari, king of the Lombards, died a few days after Gregory's consecration as pope and was succeeded by Agilulf, duke of Turin. Gregory attempted to negotiate a separate peace for Rome with the Lombards, using Queen Theodolinda, who was a Catholic and a close friend, as an intermediary with King Agilulf and other Lombard chiefs. He exercised his temporal authority in response to the Lombard threat by appointing governors to cities, providing munitions, counseling generals, sending ambassadors, and negotiating, often without imperial authorization from Constantinople.

Gregory's connections with the Franks were perhaps the most important legacy of his papacy, because they resulted directly in his major diplomatic and spiritual accomplishment—the missionary effort in the British Isles. The Kentish queen, Bertha, was a Catholic Frank who wrote to Gregory often and at length, asking him to send spiritual ambassadors to the Kentish court and eventually to the entire island. The story of the mission to England of Saint Augustine of Canterbury in 597 was recorded in Gregory's letters and was also recounted by an anonymous monk of the English abbey at Whitby in the early eighth century. The English mission eventually brought together the Celtic and the Roman churches that had been torn apart by the breakup of the Roman empire two centuries earlier. After settling ecclesiastical and liturgical practices, English monasticism would reach its full flowering in the early ninth century, when Alcuin, a monk of York, became chief

spiritual adviser to Charlemagne. Gregory's accomplishment earned him the title "apostle to the English."

In his relations with the imperial government, Gregory again trod new ground. He believed that church and state should form a united whole, yet be as distinct and independent from each other as possible in their respective spheres, the ecclesiastical and the secular. The records of the imperial government centered in Constantinople under Emperor Maurice and eventually Emperor Phocas are a source for the interaction between it and the Roman church, as is Gregory's immense correspondence.

Besides his missionary effort to the Angles, Gregory also made efforts to root out paganism in Gaul, Africa, northern Italy, and Istria. His policy toward schismatics, pagans, and heretics was to use persuasion first and force only as a last resort. His contribution to monasticism followed naturally from his own background as a monk. Gregory's firm opinions on discipline, order, austerity, and obedience among monks, abbots, and bishops are extensively recorded in his numerous letters and were applied by many monastic orders during the Middle Ages.

The last years of Gregory's life were filled with suffering, both mental and physical. He died on 12 March 604, and his body was displayed in the portico of Saint Peter's basilica. His relics were moved several times during the medieval period and later, most recently by Pope Paul V in 1606. He was canonized immediately by popular acclaim. In art, the dove is his special emblem, because of a story, recorded by Peter the Deacon, that a dove placed the word of God on Gregory's lips while he was dictating his homilies on Ezekiel to his secretary.

Gregory the Great was not a philosopher or a man of profound learning; but he was a trained Roman lawyer, a monk and missionary, a highly regarded preacher, and a leader of men. His two major contributions to the papacy were his intense focus on convincing the world that the see of Peter was the one supreme, decisive, authority in the Catholic church, and his mission to the British Isles. He enabled the papacy, eventually, to become a power stronger than king, emperor, or patriarch. In his writings, Gregory summed up the teachings of the early fathers in a harmonious whole, so that they became a textbook for laymen and clerics alike throughout the medieval period. Writings

confidently attributed to Gregory are *Moralium libri XXXV*, *Regulae pastoralis liber*, *Dialogorum libri IV*, *Homiliarum in evangelia libri II*, *Homiliarum in ezechielem prophetam libri II*, and *Epistolarum libri XIV*. Gregory's extensive contributions to the standardization of the liturgy and liturgical music include several hymns, the Gregorian sacramentary, and the antiphonary.

Gregory II, Pope

Pope Gregory II (669-731, r. 715-731) was born into a Roman family. He had extensive experience as a papal functionary and diplomat, participating in a papal embassy to Constantinople and negotiating with Emperor Justinian II in disputes concerning the Quinisext Council of 692. In May 715, Gregory was chosen pope—the first of Roman background after a series of popes of Greek and Syrian birth. Gregory's main problems then involved dealings with the Lombards, who were newly resurgent under King Liutprand (r. 712-744). The Lombard threat reached a climax in 729, when Liutprand menaced Rome and was deflected only by Gregory's dramatic personal intervention. Meanwhile, Rome's overlord, the Byzantine emperor in Constantinople, who was supposed to be providing protection, was instead levying burdensome taxes. The mounting tension was complicated when Emperor Leo III initiated his new religious policies of iconoclasm. Gregory not only objected to iconoclasm as heretical but resisted the concept that the emperor had a right to interfere in matters of doctrine. Throughout Italy, Leo's attempts to impose the iconoclastic policies by fiat prompted widespread resentment and resistance, of which Gregory became the principal spokesman. Gregory, as a sponsor of the missionary work of Saint Boniface in northern Europe, pursued contacts with the Frankish ruler Charles Martel, thus initiating what would become a new direction of papal policy. An active builder and a strong supporter of monasticism, Gregory was responsible for beginning a restoration of

the Abbey of Monte Cassino after its destruction by the Lombards. His active interest in liturgy and liturgical reform was also reflected in his introduction of Roman liturgical practice to the German church. He planned a journey to northern lands but died before he could undertake it.

Gregory III, Pope

Pope Gregory III (d. 741, r. 731-741), a priest in Rome of Syrian origin, was chosen pope by spontaneous popular acclaim during the funeral of Gregory II. As Gregory III, he inherited from his predecessor a growing problem of friction with the Byzantine emperor Leo III over Leo's program of iconoclasm. Failing to persuade Leo to change his policies, Gregory launched a strong campaign against them, which provoked Leo to send a punitive military expedition to Italy. However, the expedition ended in disaster, and Leo then retaliated by exercising the imperial rights of ecclesiastical administration, to the disadvantage of the papacy. Specifically, he transferred the church provinces of Sicily, Calabria, and Illyricum (the Balkan peninsula), which until then had been under Roman jurisdiction, to the see of Constantinople—at a great cost to Rome in revenue and influence.

Despite Leo's actions, Gregory attempted to remain loyal to imperial authority and even gave aid to the Byzantine exarch of Ravenna when Lombards briefly expelled the exarch from that city (737–740). Such steps provoked renewed hostility from the Lombard king Liutprand, and Gregory was impelled to repair the fortifications of both Rome and Civitavecchia. With regard to diplomacy, Gregory sought alliances with Liutprand's rivals, the dukes of Benevento and Spoleto. This led to direct aggression by Liutprand. Recognizing that it was futile to depend on the Byzantine empire and that a more formidable protector was needed, Gregory turned to the one western Germanic power of sufficient strength. During 739-740 Gregory sent embassies to the Frankish leader Charles Martel, urgently beseeching his assistance. Charles, who was on good terms with Liutprand, declined the request; but although such appeals were not immediately successful, they became the precedent for a momentous alliance soon to come between the papacy and the Franks. For the moment, however, Gregory could only turn again to Liutprand's rivals, further inflaming the Lombard king.

Although his policies in Italy would not reach fruition until the reigns of succeeding popes, Gregory did not miss opportunities to extend the influence of the papacy to northern lands, continuing his predecessor's support of Saint Boniface in Germany and of the see of Canterbury in England. Gregory died, ironically, in 741, the same year that saw the death of his bitter opponent, Emperor Leo III.

Gregory VI, Pope

Pope Gregory VI (John Gratian, Giovanni Graziano; d. 1048, r. 1 May 1045-1046) had been canon of San Giovanni fuori Porta Latina in Rome. He became pope after the abdication of his godson, the Tusculan pope Benedict IX (r. 1032-1045 and 1047-1048), and after either Gregory VI himself or his supporters had reimbursed Benedict IX for his election expenses.

The use of money to obtain a spiritual office led to the accusation of simony at the latest on 20 December 1046, when a synod convoked and guided by King Henry III met in Gregory's presence and deposed the pope, as well as Sylvester III, a bishop of Sabina who had been pope for a few weeks in early 1045, when an uprising had expelled Benedict IX from Rome before Benedict ceded the papacy to his godfather in May. A second synod held by Henry III in Rome on 23 December deposed Benedict IX and elected Henry's court chaplain, Bishop Suidger of Bamberg, as Pope Clement II (d. December 1047). Gregory VI was sent

into exile in Germany, probably in Cologne; he was accompanied by some of the papal clergy, including Hildebrand, who was much later to become Pope Gregory VII. Gregory VI died, possibly at Cologne, in mid-December 1047.

Little is known about the pontificate of Gregory VI. He was, however, a church reformer. His own accession as well as the depositions at the synod of Sutri demonstrated clearly that a reform of the papacy was desperately needed. The actions of Henry III freed the see of Saint Peter from its dependence on the Roman nobility and enabled the popes to become the leaders of the eleventh-century church reform.

Gregory VII, Pope

Pope Gregory VII (Hildebrand; c. 1020-1085, r. 1073-1085) was the only Italian among the eleventh-century reforming popes involved in the investiture controversy, apart from Paschal II (r. 1099-1118). Gregory VII was born in southern Tuscany (possibly in Soana) into a well-to-do

family and came to Rome as a young child. In his letters, Gregory mentions that he grew up in the bosom of the Roman church, and he refers to the special guardianship of the apostle Peter, as well as to a Roman palace (perhaps the Lateran) where he attended school with other upper-class Romans. He spent some time at the monastery of Saint Mary on the Aventine Hill, where his uncle was abbot. Saint Mary's had once been reformed by Abbot Odo of Cluny and had connections with certain local reformers of the church.

The first secure date for Gregory VII—then Hildebrand— is January 1047. He accompanied Pope Gregory VI (r. 1045— 1046) into exile in Germany after the latter's deposition by Emperor Henry III at the synod of Sutri (20 December 1046). In early 1049, Hildebrand returned to Rome in the entourage of Pope Leo IX (r. 1049—1054). He had probably become a monk by then, although it remains unclear where and when he made his vows. Certainly, however, this did not occur at Cluny. In Rome, he became subdeacon and then rector of the Abbey of Saint Paul's Outside the Walls. He was sent as papal legate in 1054 to the synod of Tours and in 1056 to the synod of Chalonsur-Saône. The synod at Tours was concerned with the teachings of Berengar of Tours on the eucharist (a topic that Hildebrand would have to deal with again later, as pope); the synod at Chalonsur dealt with simony and led to the deposition of six simoniac bishops by Hildebrand. At least once during these years, Hildebrand must have been at the court of Emperor Henry III (d. 5 October 1056); later, as pope, he would note that Henry III honored him more than other Italians. Moreover, Hildebrand participated in a court ceremony in which the boy Henry IV (r. 1056-1105) was either elected or acclaimed king. In 1057, Pope Stephen IX (r. 1057-1058) once again sent Hildebrand to Germany, together with Anselm of Lucca (later Pope Alexander II, r. 1061-1073). Stephen IX demanded a solemn oath from the cardinal bishops and the clergy and laity of Rome that if he died they would await Hildebrand's return from Germany before electing a successor; this is an indication of Hildebrand's standing in Rome. It is very likely that Hildebrand collaborated actively with Stephen's successor, Pope Nicholas II (r. 1059 — 1061) and helped shape Nicholas's policies toward the Normans and the Patarnes; but it is difficult to identify Hildebrand's influence precisely or to determine whether he differed from other reformers.

Apparently, he did not sign the election decree of the Lateran synod of April-May 1059, but in a speech at this council he severely condemned the Aachen rule of 816 for regular canons, which had permitted the holding of private property. In the autumn of 1059, Nicholas II named Hildebrand archdeacon of the Roman church, entrusted with financial, judicial, and military tasks. Hildebrand would also have been responsible for the papal states, would have acted as vicar during the pope's absence, and would have administered the see of Rome during a vacancy. These were heavy responsibilities, but it would be an exaggeration to claim that Hildebrand was the power behind the papal throne during his more than twenty years at the curia.

Pontificate

During the funeral of Alexander II on 22 April 1073, Hildebrand was proclaimed Pope Gregory VII in a tumultuous election by the Roman people—an election that was subsequently formalized by the cardinals, the clergy, and the Roman laity in San Pietro in Vincoli. Gregory's pontificate is relatively well known. His invaluable register, the official papal record containing chiefly his letters but also some synodal protocols, feudal oaths, etc., is still preserved in the Vatican's Archivio Segreto. It provides a solid basis for an evaluation of Gregory's policies, but it is limited because only a certain number of letters were registered (the selection criteria are unknown), because many important letters were originally supplemented with oral messages, and not least because many of Gregory's declarations are ambiguous and often impenetrable for modern readers.

Gregory interpreted his election as a call by God to continue unhesitatingly, not to say ruthlessly, the fight for what he considered the proper world order and to restore the church to its original splendor, as envisioned by the eleventh-century reformers. He linked the battle against simony and for celibacy—the chief characteristics of the Gregorian reform (which took its name from him)—with a marked emphasis on the primacy of the papacy. This primacy did indeed include the subordination of all temporal Christian governments to the pope's authority, but it applied first of all to the ecclesiastical hierarchy.

In Gregory's view, all Christians, including kings and emperors, owed the papacy unquestioned obedience because the pope alone, by virtue of his mystic connection with Saint Peter, would never deviate from the Christian faith. According to Gregory, Saint Peter himself, through the pope, directed the church. Obedience to God became obedience to the papacy.

Gregory's attitude had profound political consequences. He emphasized the territorial claims of the papacy and tried to bring several areas of Europe under the overlordship of Saint Peter, i.e., the pope. The conditions varied; they included the simple oath of fealty by William of Burgundy and clearly feudal relationships involving homage and investiture as well as fealty. The popes thus became feudal lords. The vassals' obligations corresponded to those customary in the secular sphere and included military and financial aid. Examples are the alliances with the Normans (1059), Aragon (1068), Denmark, Hungary, Kiev, Croatia, and Dalmatia. Like his predecessor, Gregory supported the *reconquista* in Spain by French knights, provided that they were willing to take over the conquered lands as vassals of Saint Peter—since, Gregory argued, Spain had belonged to Peter from ancient times. Some princes of Poland and Bohemia had asked Gregory for support of their claims, and it is not surprising that he expected special links to the papacy in return. He saw the relationship with England similarly. In 1080, he wrote to William the Conqueror, reminding William of his assistance in 1066. As we can gather from William's negative reply, the messengers who delivered the letter had asked him to do homage for England to the pope. The legal premises for the largely unsuccessful papal claims are still disputed, but evidently the Donation of Constantine played only a subordinate role. These feudal relationships—which were an innovation as far as the papacy was concerned—were intended to further church reform and to gain financial and military support for papal policies. Episcopal oaths also included the promise of troops. Since Gregory also planned to lead an army to assist Constantinople against the Muslims, it is not surprising that he has the reputation of being a particularly warlike pope.

Gregory never had occasion to intervene in England; and Spain largely accommodated the claims of the papacy. In France and Germany, however, direct intervention by the papacy in the

appointment of bishops and the prohibition of their investiture with ring and staff (possibly 1077-1078) created severe tension. Especially serious were Gregory's clashes with Germany, although, despite some initial problems, there was no hint of this at the outset of Gregory's pontificate. Gregory, who saw in Henry the future emperor, suggested in a letter of December 1074 that Henry was to protect Rome and the Roman church during the papal crusade. It was the German episcopacy rather than the king that appeared to hinder church reform in Germany. Gregory counted on Henry's support. But events taught him otherwise, and in a letter of December 1075 to Henry, Gregory can barely contain his anger. It is possible that the oral message accompanying the missive was a threat of excommunication. In harsh language, Gregory blamed Henry especially on account of the customary royal appointments to the Italian bishoprics of Milan, Fermo, and Spoleto. A second issue was Henry's continued contact with his excommunicated advisers. On 24 January 1076, at the Diet of Worms, Henry IV and the vast majority of the German bishops replied in even harsher terms. In a letter addressed to "Brother Hildebrand," they renounced their obedience to Gregory. The king asked Gregory to abdicate and the Romans to elect a new pope. Northern Italian bishops immediately joined in this renunciation of obedience. The letters reached Gregory during the Lenten synod (14-20 February 1076), and he replied at once, declaring Henry deposed and absolving all of Henry's Christian subjects from their oath of fealty. Henceforth no one was to serve Henry as king, and Henry was anathematized.

The effect of the excommunication was tremendous. Gregory assumed that he had historical precedents on his side, but never before had a pope deposed a king. Gregory's deposition of Henry was then, and has remained, his most hotly debated action. Gregory had pursued to its logical conclusion his conviction that papal primacy was secular as well as spiritual. Church reform now became a struggle over dominance between priestly power and royal power. To save his crown, Henry submitted to Gregory at Canossa (28 January 1077), implicitly recognizing the papal claim to universal lordship.

The encounter at Canossa interrupted Gregory's journey to Augsburg, where the German princes had intended to elect a new king. After the reconciliation of Henry with the church, Gregory returned to Rome, but

the German princes nevertheless proceeded to elect Rudolf of Swabia (15 March 1077). Gregory waited until the Lenten synod of 1080 to grant Rudolf full recognition as king; at that time he repeated the excommunication and deposition of Henry IV. However, Henry had reasserted himself after his absolution at Canossa; the new excommunication had little effect; and the king was victorious in a civil war. A royal synod at Brixen formally deposed Gregory (25 June 1080) and elected Wibert (Guibert, Guiberto) of Ravenna pope, or antipope; he was eventually enthroned in 1084 as Clement III. Henry's Italian campaign of 1081 was successfully concluded when he entered Rome on 21 March 1084; the gates of the city were opened to him by many members of the Roman clergy who condemned Gregory's inflexible attitude, and by the Roman populace. Clement III crowned Henry emperor on 31 March 1084. Gregory VII had fled to Castel Sant'Angelo. He was freed by his Norman vassal Robert Guiscard in May and accompanied Robert to Salerno; there, in exile, Gregory died on 25 May 1085. Pope Paul V canonized Gregory in 1606, and his feast day (25 May) was expanded from Salerno to the entire church in 1728.

Gregory VII was certainly one of the great medieval popes. The history of papal primacy—especially but not only with regard to secular power—cannot be imagined without him. Gregory attempted to translate his own religious experience, with its mystical core, into historical reality. Concepts that he grasped intuitively were legally and theoretically elaborated in the twelfth and thirteenth centuries, resulting in what is known as the papal monarchy.

Gregory IX, Pope

Pope Gregory IX (Ugolino, Ugo, Hugolino, count of Segni; c. 1170—1241, r. 19 March 1227-22 August 1241) was born in Anagni and studied in Paris and Bologna. In 1198, under his great-uncle Pope Innocent III, he became cardinal deacon of Saint Eustachius. In 1206, he was consecrated cardinal bishop of Ostia; he kept this position until he was

elected pope. The papacy of Gregory IX was marked by a struggle against heresy; by continual fights with Emperor Frederick II; and by strong support of religious orders, in particular the newly founded mendicant orders—the Dominicans and Franciscans.

Gregory attempted to defeat heresy on all fronts. He first turned against the Albigensians in southern France and signed a treaty with Raymond VII of Toulouse for the suppression of the Waldenses and the Cathars. To relieve the bishops of France and increase the efficiency of the battle against heresy, Gregory made the Inquisition an institution directly affiliated with the papacy. From then on, the Inquisition became centralized and operated under the pope's direct authority. This centralization of inquisitorial powers was soon extended to Italy, where great numbers of Waldenses and Cathars had fled. As part of the effort to eliminate heresy, the Militia of Jesus Christ was created and approved in 1234. Those Cathars who had moved from Languedoc across the Pyrenees into Spain were also persecuted and repressed. For this purpose, King James I of Aragon made the Inquisition an institution of his state.

During Gregory's reign, the relationship between the papacy and the empire was particularly tumultuous. In September 1227, shortly after his ascent to the papal see, Gregory excommunicated Frederick II, who had refused to commit himself to a promised crusade. Gregory renewed the excommunication in March 1228 and then put all of Frederick's places of residence under an interdict. After the emperor left on a crusade in June 1228, Gregory began a campaign against him in Italy and reappropriated all papal territories that had fallen under imperial rule. Frederick then came back from the Holy Land and reconquered part of them. A peace was reached in June 1230, according to which Frederick's excommunication was lifted and papal properties were restored to Gregory.

Throughout his papacy, Gregory was a strong supporter of religious orders. The Camaldolese, the Cistercians, and the followers of Joachim of Fiore profited immensely from papal support. Gregory canonized Saint Dominic and also made special use of the recently founded Dominicans in the struggle against heresy. As Cardinal Ugolino, before his election to the papacy, he had been a special protector of the Franciscans and a friend of Francis; as pope, he canonized Francis in

1228, after declaring the authenticity of Francis's stigmata. Their amicable relationship began at their first meeting in 1217. Ugoiino introduced Francis to Dominic and in 1221 was appointed official protector of the new Franciscan order by Pope Honorius III. In this position, Ugoiino urged all bishops and prelates, who suspected the new and radically poor religious of heresy, to oppose them no longer and grant them permission to preach. He helped Francis draft the Franciscan rule and was responsible for the rules of the Poor Clares and of the third order of Franciscans.

Gregory also had a fundamental role in organizing and incrementing canon law during his papacy. He established the systematic collection of canon laws and pontifical and conciliar constitutions that became known as the *Decretales*.

Gregory X, Pope

Pope Gregory X (Teobaldo or Teldaldo Visconti; 1210-1276, r. 1271-1276) was born at Piacenza. He became canon of Lyon and archdeacon of Liege before becoming pope. Not yet ordained a priest, he was on a crusade at Acre with Edward I when he was elected to the papacy. Gregory X was more concerned than his predecessors with ending the interregnum in the empire. He encouraged the election of Rudolf of Hapsburg as king of the Romans in 1273. He also encouraged a union between the Greek and Latin churches, which was approved in 1274 at the council of Lyon. To further the negotiations, he forbade Charles of Anjou to pursue plans for an expedition to recover the Latin empire of Constantinople for Charles's son-in-law. Charles, facing opposition in northern Italy, had to obey, giving the Greek emperor Michael time to organize a defense and to encourage the northern Italian Ghibellines—including his ally, Genoa—to take a stance against Charles. Consequently, war erupted between Guelfs and Ghibellines in the north, threatening the Angevin lordship in Piedmont. Gregory, rather than supporting Charles, called in the emperor-elect Rudolf, who did little to pacify the area and nothing to help Charles. By 1276, Charles lost almost all of Piedmont.

Gregory was not entirely hostile to Charles—he urged Charles to buy Maria of Antioch's claim to the kingdom of Jerusalem—but he discouraged the Angevins' pretensions in northern Italy; and his main goal, peace within Christendom to facilitate a crusade in the Holy Land, ran counter to Charles's objectives.

Gregory XI, Pope

Pope Gregory XI (Pierre-Roger de Beaufort, 1329-1378, r. 1370-1378) was a nephew of the Avignonese pope Clement VI. Gregory held church appointments from his early years; his uncle made him a cardinal in 1348, and he was sent for a legal education to the University of Perugia, where he studied under Pietro Baldo degli Ubaldi. Among the cardinals at Avignon, he became known as an expert on Italian affairs as well as on law. He accompanied Pope Urban V to Rome (1367-1370); this journey drew his attention more strongly to the burning issue of the return of the papacy to that city.

On 30 December 1370, at Avignon, he himself was chosen as pope. Despite his quiet disposition and his chronically poor health, he was a dedicated and energetic pope. He seems to have committed himself from the outset to the goal of returning the papacy to Rome, but he was deterred by numerous distractions, including a severe shortage of revenue. He worked to bring peace between the English and French monarchies, then engaged in the Hundred Years' War; and he did at

least establish his reputation as a mediator in their disputes, and in the conflicts of other princes as well. He dreamed of organizing Christendom to undertake a new crusade. He also worked to resolve conflicts among the states of Italy, and particularly to counter the ambitious designs of the Visconti family of Milan, against whom he went so far as to impose an interdict and preach a crusade. At the same time, he remained French in spirit and continued to fill the College of Cardinals mainly with French appointees.

His efforts to realize the return to Rome were frustrated by Florentine interests, which forced him to impose an interdict on Florence. He was, however, able to send a mercenary force under cardinal Robert of Geneva to restore order in the papal states. Prodded by remonstrances from Catherine of Siena during her residence in Avignon, he finally carried out his journey to Rome, arriving there in January 1377. In the ensuing months he was occupied with a large number of projects; the plans for a crusade against the Turks came to naught, but he undertook major efforts to reform the Hospitallers and the Dominicans. He became a tireless opponent of heresy, including the beliefs of Wycliffe in England. He faced continued diplomatic difficulties with Florence as well as with the Holy Roman emperor Charles IV. Gregory's reputation in Italy was further tarnished by the atrocities committed by Robert of Geneva at Cesena in February 1377. Worn out by mounting criticism and disillusioned by the strife around him, Gregory died on 27 March 1378. He is buried in the church of Santa Francesca Romana in Rome.

Gregory of Monte Sacro

The Benedictine monk Gregory of Monte Sacro (c. 1190-c. 1245) is the foremost religious poet of the Norman-Swabian period in the kingdom of Sicily. He was of Apulian origin, and his original name may have been a diminutive of Peter. He entered the religious life early, under the patronage of the cardinal legate Gregory of Sancto Apostolo (papal governor designate of Sicily, 1199; d. 1202), taking the name of this "adoptive father." Gregory undertook advanced study in Rome and in Paris, traveled to England, and came to know several leading churchmen. By 1220, he had been elected abbot of Santissima Trinita on Monte Sacro in the Gargano peninsula, a monastery directly subordinate to the papacy. From here he oversaw dependent churches and priories in eleven dioceses and conducted special papal missions in the region. Here, too, he wrote much of his poetry, all of which is in Latin, and oversaw its copying in several manuscripts. Two of these manuscripts survive, one partly autograph.

Until relatively recently, Gregory was known chiefly for his *Perì tòn anthrópon theopíisis*, or *De hominum deificatione* ("On the Deification of Men"), a huge learned didactic poem of more than 13,000 hexameters. This encyclopedic theological work was completed sometime between 1228 and 1239 and was intended as an exhaustive and rationally arranged guide for the attainment of Christian salvation.

Additionally, modern editing has confirmed Gregory as the author or probable author of some 2,700 lines of fluent, often sonorous metrical and rhythmic poetry in less extensive compositions. Among these are *Cur deus homo*, an impressive semidramatic piece in 362 strophes; *Flores psalmodum*, a poem to Jesus based on the Psalter and consisting of a preface and 171 strophes; *Oratio*, an ecstatic prayer to Christ in 253 hexameters; a sizable body of liturgical writing; and smaller poems on a

variety of topics.

Grimaldi Family

The Grimaldi family was one of four outstanding noble families of medieval Genoa. Its origins go back to the twelfth century; and its head may be identified as Otto Canella, who in 1133 and c. 1135 served the commune as consul, the highest communal office at that time. His youngest son, Grimaldo, also held the consulship in 1162, 1170, and 1184. Grimaldo was, moreover, among the Genoese ambassadors at the court of Frederick I Barbarossa, at the royal court of Morocco, and at the Byzantine court of Constantinople. From this time onward Grimaldo was used as the family name (*Grimaldi filius*, "son of Grimaldo").

The Grimaldi acquired wealth in commerce and banking and played

a vital role in the making of policy and in the internal factionalism of medieval Genoa. The Grimaldi together with the Fieschi family formed the leading party of Guelfs in Genoa, loyal to the interests of the papacy. As a result of continuing conflicts with the Genoese Ghibellines led by the Doria and Spinola families, the Grimaldi and other Guelfs were forced to leave Genoa three times, in 1270, 1296, and 1335. During the second period of exile, Francesco Grimaldi (d. 1309), called Malizia, led a surprise attack in which the Guelfs conquered the "old castle" at the top of the rock of Monaco in January 1297. However, they had to withdraw again in 1301.

Monaco was an important port with a Genoese fortress (from 1215 on) in the extreme western part of the city's sphere of influence. With temporary interruptions during the first half of the fourteenth century, Monaco henceforth served the Grimaldi as a strategic base that became the main stronghold of the dynasty. In 1341, the Grimaldi acquired the fortress and the countryside from the Spinola family. From Monaco, the Grimaldi family operated its famous fleet either on behalf of the French crown or for piracy.

At the beginning of the fourteenth century there were already ten family lines, one of the most important being the Monacan line. In this line, Rainier I (1267-1314), a cousin of Francesco Malizia, fought at sea in the service of the French crown. Rainier I was named commander-in-chief of the French fleet after a successful battle against the Flemish fleet at Zierikzee in 1304. Back in Naples, he was appointed baron of San Demetrio in Calabria by King Robert of Anjou and received the important *signorie* of Cagnes and Antibes. His son Charles I (d. 1357) served as admiral under King Philip VI of Valois and was much involved in the military activities of the French crown in the Hundred Years' War. In the battle of Crécy (1346), Charles I and Ottone Doria led 6,000 arbalesters. Between 1370 and 1400, fourteen members of the Grimaldi family served France as commanders of arbalesters or as admirals, among them Rainier II (d. 1407), son of Charles I. After being expelled from Monaco again in 1357, the Grimaldi dynasty was not able to reenter it until 1419, under John I (1382–1454) and his wife Pomellina Fregoso. John's will has been important for the continuity of the family's dominion in Monaco until the present day: in the absence of a male successor, a female Grimaldi can inherit only if her husband

and their children exclusively assume the name and arms of Grimaldi.

Grimoald of Benevento, King

Grimoald I (d. 671), the son of Gisulf II of Friuli, was duke of Benevento from 647 and king of the Lombards from 662 to 671. Grimoald and Rothari are among the very few rulers of the Lombards who were almost certainly Arian Christians.

Grimoald's reign was somewhat unusual in that Benevento was normally not a cohesive part of the Lombard state, and most dukes of Benevento were content to act as virtually sovereign rulers in their own duchy. However, the separation of Benevento continued even during the reign of Grimoald, who seems to have left his son Romoald to rule Benevento in his absence. Grimoald's reign was spent in dealing with renewed imperial threats to the Lombard boundaries and in quelling internal disorders. However, he also found time to issue nine laws to supplement the *Edict* issued by Rothari in 643.

After his death, Grimoald was succeeded very briefly by a young son, Garibald, who was almost immediately overthrown by Perctarit.

Grottaferrata

Located southeast of Rome along the ancient Via Latina, the monastery of Grottaferrata sits in a valley between the Alban and Tusculum hills. In the seventh century B.C., the area was inhabited by the Etruscans; some centuries later, many Roman villas were built in the hills, among which was Cicero's famous Tusculanum. The site of the monastery may have belonged to the Roman Acilii family, and it was renowned well into the late Middle Ages for its fresh clear water from the Giulia River. Very little is known about the history of the area during the medieval period until the eleventh century; but inscribed early Christian gravestones from the third and fourth centuries indicate that Grottaferrata was already a Christian burial site during the period of persecutions and at the time of the "peace of the church" under Constantine (312-314).

Grottaferrata began its rise to a major monastic site in the early eleventh century, when the Basilian order of the Greek rite established a house there following the tradition of its founder, Saint Basil (c. 330-379), who brought the Greek language to Italy in the early Middle Ages. Nilus (Nicolas Malana da Rossano) the Younger and his disciple Bartholomew da Rossano (who were both born in Rossano in Calabria) founded the monastery in 1004. As legend has it, Nilus, Bartholomew, and their companions were traveling from their monastic house at Vallerucio (near Cassino) to Rome to seek the aid of the papacy against the German emperor Otto III. On their return to Rossano, they were caught in a terrible storm and sought refuge in a grotto, where the Virgin appeared to them, gave them a golden apple, and exhorted them to build a monastery on the spot. The abbey was constructed on the site of an ancient Roman villa; and the name Grottaferrata may be derived from *crypta*, *crupta ferrea* and thus may refer to two small rooms with iron grille windows that comprised a burial chamber of the villa and became a Christian oratory in the fifth century. Alternatively, it may be

derived from *cryptoporticus*, a term referring to a hidden passageway in the villa.

When Otto III died in 1002, Gregory I, count of Tusculum, donated the land to Nilus and his companions for a new monastery. Nilus died two years later, on 26 September 1004, and the abbey church was built by his successors, Bartholomew and Cyril. It was consecrated on 17 December 1024 and was dedicated to the Virgin Mary by Pope John XIX (another member of the Tusculum family). In the fifteenth century, it was fortified by Giuliano Sangallo. The monastery is now surrounded by massive walls and turrets but still retains some of its early Byzantine structures

In spite of its connection to Greece, the community maintained strong ties with Rome. Initially, Grottaferrata had direct support from the papacy, and in the first two-thirds of the twelfth century it received many donations. During the Middle Ages the monastery was protected by a (now dilapidated) tenth-century castle called the Borghetto, owned first by the counts of Tusculum and later, in the thirteenth century, by the Roman Savelli family. In later years the monastery came under the protection of subsequent popes, which was a mixed blessing. In the eleventh century, Robert Guiscard, duke of Puglia (Apulia), invaded the town that had grown up around the monastery and massacred its citizens. In the late twelfth century, during a conflict between the counts of Tusculum and the Romans, the town of Tusculum was destroyed; the monks fled to the monastery at Subiaco and did not return for a number of years. In 1241, while on an expedition to lay siege to Rome, Frederick II resided in the monastery; by his presence there, he wished to indicate his symbolic occupation of papal territory. This type of occupation of the monastic complex by foreign forces recurred during the struggles between the pope and the antipope, the Caetani family, and Ladislao (king of Naples); and the complex was occupied again, by Niccolò da Fortebraccia, during the struggle of Martin V to retake Rome after the end of the Great Schism (Council of Constance, 1417).

Despite these incursions, Grottaferrata was the center of Greek learning in Italy during the Middle Ages; and although it eventually came under latinizing influences, it always maintained a strongly Greek ambience, as may be seen in its large production of fine Greek

manuscripts. The complex suffered depredations during the Napoleonic invasions, but an eleventh-century baptismal font and remnants of Cosmatesque floor, wall, and other decorations have survived.

The chapel of Saint Nilus and other parts of the abbey church, including its murals and mosaics, were restored relatively recently. Both the murals and the mosaics depend considerably on earlier Byzantine traditions; most notably, they reflect the narthex porch mosaics of Hagia Sophia in Constantinople. In the church vestibule (portico), eleventh-century columns and ancient capitals support a horizontal marble architrave in the Byzantine style. The fine marble cornice around the main entrance portal (the *Porta Aurea*) is decorated with birds and other animals accompanied by inscriptions in Greek. Mosaics dating from the eleventh and twelfth centuries were installed in the tympanum over the portal and repeat the *deists* formula of Hagia Sophia in Constantinople, but they reflect more directly the styles of the cathedrals in Cefalii and Monreale: Christ is enthroned between the Madonna and John the Baptist, with the smaller figure of Saint Bartholomew of Rossano included as a devotee suppliant for the Greek monks. A thirteenth-century mosaic depicting the disciples at Pentecost, six seated on each side of the empty throne, also survives on the triumphal arch of the church choir; and above this tessellated mosaic frieze is a fresco of Christ seated on the lap of God the father, with light radiating from him to the apostles in the mosaic below. Other frescoes dating from c. 1272 that once decorated the nave of the church have been detached and removed to the monastery museum. Murals illustrating the passion of Christ have been compared to the frescoes in the cathedral of Anagni. The museum also contains medieval sculptures, tapestries, and liturgical vestments. The bell tower dates from the thirteenth century; its trifurcated windows and polychrome tiles reflect the tastes of the Italian Romanesque. Many of the manuscripts that were not destroyed during the Napoleonic invasion have been moved to the Vatican library. These works and the surviving frescoes indicate that this location was a major artistic site.

Guariento Di Arpo

Guariento di Arpo (fourteenth century), the first important painter of his school, was already a master in July 1338, when he is first mentioned in a Paduan archival document. A crucifix originally in the church of San Francesco at Bassano (now in the civic museum there) is his only signed work; it is generally dated early. An important polyptych with the Coronation of the Virgin as its central subject and scenes of the early life of the Virgin and the story of Christ (formerly owned by the Czernin counts of Vienna and now in the Norton Simon Museum in Pasadena, California) may be securely attributed to Guariento; the date 1344 is inscribed. From the inscription and from a later document it may be deduced that the altarpiece was painted for the church of San Martino at Piove di Sacco near Padua. Not strictly documented, but supported by a strong local tradition, is the decoration of the chapel in the palace of the Carrara lords of Padua, probably painted c. 1350-1355. Old Testament frescoes survive in this room (now the main hall of the Accademia). Some of the ceiling panels, mostly depicting an angelic hierarchy, have been dispersed (to the civic museum and elsewhere); others have disappeared. In early sources, Guariento is associated with the *Sala di Tebe* (Room of Thebes) and the *Sala virorum illustrium* (Room of Famous Men) in the Carrara Palace. The Room of Thebes, painted c. 1345-1347 (and now lost), illustrated the *Thebaid* by the Roman poet Statius; the Room of Famous Men is better attributed to Altichiero and Avanzo. Early tradition ascribes to Guariento the decoration of the sepulchral chapel of the Carrara in the church of Sant'Agostino. A fragmentary detached fresco of the Coronation of the Virgin, now in the Eremitani church, once adorned the tomb of Jacopo da Carrara and was done c. 1351, the year the

Venetian sculptor Andriolo de Santi signed a contract to carve the tomb. Two other fresco fragments in the Eremitani once also belonged to the Carrara tombs. One is apparently a portrait of Jacopo and the other a portrait of Ubertino (d. 1345). In the choir of the Eremitani are the remnants of a great fresco cycle (half destroyed during World War II) depicting the Last Judgment; the legends of saints Augustine, Philip, and James the Less; and other subjects, including the pagan star gods and the ages of man. These too are undocumented, but a strong local tradition supports their attribution to Guariento; they were probably painted in the 1360s. The early sources also agree that Guariento painted the imposing fresco of the Coronation of the Virgin in the Hall of the Great Council of the Ducal Palace in Venice. (It has been removed to another room and is in poor condition.) An inscription stated that it was done for Marco Cornaro, doge from 1365 to 1368. Documents prove that Guariento was in Venice in March 1366 and back in Padua in December 1367. From July 1338 to this latter date, Guariento's name appears at varying intervals in Paduan archival documents. December 1367 is the last time he is mentioned as alive; in an instrument of September 1370 he is described as deceased.

Several works may be attributed to Guariento on the basis of style alone. Among the most important of these are three panels of the enthroned Madonna and Child (one in the Courtauld Institute in London; another in the Weitner Collection in London; and the third, which may be part of an altarpiece from the Carrara Palace chapel, in Berlin). All three were probably painted c. 1345-1355.

Guariento di Arpo (fl. 1338, d. 1367 or 1370), *Allegory of the Sun*. Fresco. Chiesa degli Eremitani, Padua. Photo: © Almari/Art Resource, N.Y.

The Norton Simon polyptych and other early works by Guariento show the influence of Giotto's decorations in the Arena Chapel and of the school of Rimini, including the frescoes in Padua attributed to Giuliano and Pietro da Rimini. Guariento's work is more Gothic, but the Gothic style was not uncommon in painting and sculpture in the Veneto at the time. It was a principal component of the art of Paolo Veneziano, with which Guariento was familiar. Guariento must have studied the work of the great Sienese painters of the first half of the *Trecento*, particularly the Lorenzetti; and there is evidence that he knew of Giotto's pupils in Florence, who were themselves aware of the Sienese. Guariento's frescoes, invariably crowded with animated, realistic figures and characterized by deep, elaborate architectural settings, influenced later painters active in Padua, among them Altichiero and Giusto de' Menabuoi. These two artists, with their better understanding of the achievements of Giotto, had a more lasting impact than Guariento on late fourteenth-century Paduan art. However, such works by Guariento as the Coronation of the Virgin in the Ducal Palace and his enthroned Madonnas inspired Venetian painting until at least the fourth decade of the fifteenth century and also inspired the international Gothic style.

Gubbio

Gubbio (Iguvium, Eugubium, Agobbio), an ancient Etruscan and Roman town in the region of Umbria, is perhaps most famous for seven bronze tablets of Etruscan origin, the *tavole Eugubine*. They were discovered in 1444 by Paolo di Gregorio, who sold them to the commune in 1456. These tablets provide information on the early rites of Etruscan religion and are most important as testimony to the ancient language of Umbria. The panels are preserved in the civic museum in the Palazzo dei Consoli.

Although it was not located on a major Roman trade route, Gubbio was designated a *municipium* in 90 B.C. Its local industries, though prosperous, have always been small: ceramics, metalwork, agricultural products, wool, and silk. Among the vestiges of its Roman past is a large and well-preserved theater from the first century B.C. Much of the ancient character of Gubbio is preserved by the finely cut stone of which most of the houses are made, reflecting building traditions that date from the Etruscan era. The streets of the medieval town are arranged in parallel rows at different levels along the hillside.

Very little is known about Gubbio's history in the early medieval period. Charlemagne reportedly stopped here after his coronation in Rome in 800. The most famous resident in the early period was Saint Ubaldo, bishop of Gubbio from c. 1126 (or 1129) until his death in 1160. Among Ubaldo's many good works was his rescue of Gubbio from destruction by Frederick I Barbarossa. Ubaldo was canonized by Pope Innocent III in 1192, and two years later his remains were translated to a basilica erected in his honor high above the city on Monte Ingino (elevation 2,500 feet, about 750 meters).

Much of Gubbio's political life was determined by the struggle between the papacy and the empire. In 1239, Frederick II entered Urribria, where factions were generally divided between the nobility and the town citizens and merchants. As in other cities, this factionalism drove a wedge between the feudal aristocracy and the thriving commercial town. After Frederick II died in 1250, the separation between the town and the surrounding castles was a critical aspect of the life of the city and remained so for the next hundred years. Initially, the feudal aristocracy won out, taking the small towns of Nocera, Fossato, Sigillo, and Sassoferrato for Perugia; but the lands and castles taken from Gubbio were eventually restored, thanks to intervention by the papacy. Gubbio then became a papal town under the control of a bishop. During the medieval period the city was divided into four parts, with each quarter placed under a major ecclesiastical institution: Sant' Andrea, San Giovanni, San Giuliano, and San Pietro.

Gubbio, like many other cities, had a *capitano del popolo* (captain of the people), who was described as the *defensor comunis e populi civitatis eugubii*. One of the leading families in Gubbio, the Gabrielli, ascended to power in 1350, when Giovanni Gabrielli became lord of the city. He ceded power to Cardinal Albornoz in 1354 after the cardinal successfully laid siege to Gubbio and captured it once again for the papacy. In 1376, Gubbio succeeded in casting off rule by papal legates and became a free commune. In 1381, the bishop, Gabriele Gabrielli, assumed the position of lord of the city, but once again a popular uprising returned it to more democratic governance. The Gabrielli family, however, continued to war with the city, which sought and received protection from Antonio da Montefeltro of Urbino in 1384.

Gubbio remained under the control of Urbino for almost 250 years, until 1631, when it returned to papal authority.

Among the earliest ecclesiastical edifices is the church of San Pietro, built c. 1000, reconstructed in the Gothic style in the thirteenth century, and subsequently heavily restored. Another early foundation is the church of Sant' Andrea (eleventh century), to which the Benedictine monastery of San Marziale was given in the late fourteenth or early fifteenth century. A number of churches were built in the Gothic style as an expression of the political life of the city in its alliance with the papacy. The fourteenth-century church of Santa Maria Nuova reflects the Cistercian style first introduced into Italy at Fossanova, and this style is also found in the church of Sant' Agostino (late thirteenth century). The church of San Francesco was built by Fra Bevi-gnate of Perugia (1259-1292) with three polygonal apses in the Romanesque tradition, but its interior is defined by a conservative Gothic style. The *duomo* (early fourteenth century) is in the Gothic style and resembles other churches in Umbria: it has single wide nave, and above the entrance portal is a large rose-wheel window surrounded by symbols of the evangelists and the mystical lamb.

Municipal buildings such as the Palazzo del Capitano del Popolo and Palazzo del Bargello date from the thirteenth century. Gubbio produced its own architects, who worked in the Romanesque style; one of these, Giovanni da Gubbio, built the cathedral church of Assisi (San Rufino, 1140) some ninety years before the more famous church of San Francesco was begun there. Another native of Gubbio, Matteo di Giovanello, called Gattapone, built a number of important fortress-palaces, such as the Collegio di Spagna in Bologna, the fortress in Spoleto, and the citadel at Porta Sole in Perugia. Gattapone and Angelo da Orvieto played major roles in the completion of the Palazzo dei Consoli in Gubbio (1332–1337), which with its characteristic battlements and bell tower is not unlike the Palazzo Vecchio in Florence. The Palazzo dei Consoli is generally considered one of the finest medieval public palaces in Italy.

Palazzo dei Consoli, Gubbio. Photograph courtesy of Christopher Kleinhenz.

The earliest known painter from Gubbio is Guido Palmerucci (c. 1280-1349; documented 1315-1349), who was influenced by Sienese art and whose work is a liberal interpretation of the style of the Lorenzetti brothers. Another native of Gubbio, Ode-risi (late thirteenth century), was a painter of miniatures in manuscripts. He was praised by Dante in Canto 11 of *Purgatorio* for his artistic excellence, but there is very little biographical information about him and few of his works have survived. An anonymous artist whose style links him to Avignon painted a fresco of John the Baptist in Gubbio dating from the mid-

thirteenth century.

Saint Francis and the Wolf, Gubbio. Photograph courtesy of Christopher Kleinhenz.

Gubbio became famous during the Middle Ages for the story of Saint Francis and the wolf of Gubbio, found in the anonymous *Fioretti* (*Little Flowers*). According to the legend, Gubbio and its citizens were menaced by a large, voracious wolf that ate not only wild animals but any hapless humans it might come across. At one point, the citizens of

Gubbio armed themselves as if for war and sought out the wolf, but they succeeded only in losing more citizens to its insatiable appetite. Saint Francis, on a visit to the town, decided to go and meet the wolf despite the warnings of the townspeople. Some of them accompanied him when he set forth, but they fled as he approached the wolf's lair. When he encountered the wolf, Francis made the sign of the cross and spoke to it, commanding it to do no harm to him and no more harm to the citizens of Gubbio, and asking for some form of acknowledgment; the wolf thereupon bowed its head to the saint. Francis then made a pact with the wolf whereby if the citizens fed the wolf it would neither threaten nor attack them. Francis returned to the town—according to tradition, to the church of Santa Maria della Vittoria—accompanied by the wolf, gave a sermon beseeching the citizens to accept the agreement, and again asked the wolf to acknowledge its understanding; the wolf then raised its paw to the saint. For the remaining two years of the wolf's life, the citizens put out food for the animal, and it attacked no one; no dogs even barked at it. This typical medieval story about the conflict between rational and irrational creatures (in this case humans and the wolf) may also be interpreted as an allegory about sin. Indeed, Francis does interpret it that way in his sermon; he reminds the citizens of Gubbio that God permits such calamities when people act sinfully, and he urges his listeners to "free themselves from the wolf," i.e., from their own appetites.

Guelfs

Before the last quarter of the thirteenth century, the Guelfs were members of the ruling elite who tended to advance their own local political and economic interests in the communes by aligning themselves with the papacy in its struggle against the emperor for supremacy in Italy. Guelfs also traditionally desired autonomy for their cities, in the sense of freedom from imperial interference. Their opponents, the Ghibellines, tended to associate themselves with the cause of the German emperor. The Guelfs did not form a coherent or unified party, however, and they defy any simple definition, identification, or categorization. They were primarily an informal amalgam of factions and allegiances (many of which predated the thirteenth century) that rallied around the papal banner to protect or acquire access to local political and economic benefits. The principal goals of these struggles included political offices and economic influence within the communes. Following the eclipse of the imperial cause in the mid-thirteenth century, "Guelf" became increasingly synonymous with support for an economic and political alliance after 1268 between the papacy, the Angevin rulers in southern Italy, and Florence.

The ideological roots of the conflict between the Guelfs and Ghibellines began in Germany during a disputed imperial election in 1198. The disputants were Philip of Swabia, who was a member of the

Hohenstaufen family and the brother of the recently deceased Henry VI (d. 1197); and Otto of Brunswick, the son of Henry the Lion (d. 1195). Henry the Lion had been the Welf duke of Saxony and Bavaria, a bitter opponent of Emperor Frederick I Barbarossa (1152-1190). Those who supported Otto and the Welf faction generally wanted the German regional nobility to be more independent of the emperor. Those who supported Philip, the standard-bearer of the Hohenstaufen faction, tended to advocate more centralized control by the emperor over the regional princes. For the nobility in Italy, support for the Hohenstaufen cause in the early thirteenth century meant advocacy of strong centralized imperial rule in northern Italy and incorporation of the communes into a single state under the rule of the emperor. After all, in the mid-twelfth century the Hohenstaufen emperor, Frederick I, had attempted, though unsuccessfully, to destroy the independence of the prosperous Lombard communes. Support for the Welf claimant, on the other hand, generally indicated a desire to maintain communal autonomy and resist imperial pressures.

By the end of the twelfth century, the aristocratic communes of Italy were already profoundly divided by factionalism and conflict. Though the history of these divisions is obscured by myth and lack of documentation, they appear to have emerged out of feuds and disputes between rival noble factions for influence and power in the early aristocratic communes. In the 1230s and 1240s, when Frederick II Hohenstaufen invaded northern Italy and attempted to reimpose direct imperial control over the entire peninsula, the papacy strongly opposed him. Indeed, papal policy basically attempted to separate Sicily—Frederick's principal power base—from the rest of his empire.

The outbreak of this conflict between the empire and the papacy for hegemony in Italy in the first third of the thirteenth century forced the already divided factions within the communes to choose sides. The split between Guelfs and Ghibellines began among these noble factions. Those who took the side of the papacy and resisted direct imperial rule came to be called Guelfs, an Italianization of the name Welf. Those who supported the imperial cause came to be called Ghibellines, an Italian corruption of Waiblingen, the name of a Hohenstaufen castle in Swabia. The earliest evidence of the terms Guelf and Ghibelline in Italy dates from Florence during the reign (1215–1250) of Emperor Frederick II.

There are references to "captains of the Guelf party" (*parte Guelfa*) in the 1240s. From Florence, the terms Guelf and Ghibelline apparently spread first to Lombardy and then throughout the rest of the Italian peninsula, probably diffused by exiles of both factions who settled in other communes.

Whereas the Guelfs called themselves the *pars ecclesiae* (party of the church), the Ghibellines referred to themselves as the *pars imperii* (party of the empire). Each side believed that its local interests would be best served through an alliance with one or the other side in the dispute between the papacy and the empire. Before 1266, Guelf associations or affiliations within the communes tended to be informal, with no coherent hierarchical organization. At this time, the Guelf and Ghibelline factions were almost exclusively composed of nobles who tended to be members of the knighted aristocracy and of the traditional consular families. In Florence, for example, dominant Guelf houses included the Visdomini, the Adimari, and the Donati. The Ghibellines tended to be the traditional aristocratic lineages with long-standing economic and political ties to the emperor. Many Ghibellines were vassals of the emperor or descendants of vassals who had received fiefs from him. They believed that an alliance with the emperor was the best means of protecting their economic and political interests (especially in the countryside) from communal encroachment. Many of the Ghibelline houses with substantial rural holdings (like the Florentine Pazzi del Val-d'arno) flourished most when communal governments were weakest.

In the mid-thirteenth century, certain Guelf aristocrats aligned themselves increasingly with the *popolo*, an association of prosperous, upwardly mobile, but nonnoble residents who demanded more political equity and representation in the affairs of the commune. Guelfs and the *popolo* had a common interest in opposing imperial interference with the internal affairs of the communes and in preserving communal independence. During the *primo popolo* (1250–1260) in Florence, for example, certain segments of the Guelf aristocracy increasingly found common ground with the *popolo*. The Ghibellines' defeat of the Florentine *popolo* at Montaperti in 1260 began a six-year period of Ghibelline control of the commune, further encouraging the fusion of the Guelfs and the *popolo*. The Guelfs expelled the Ghibellines in 1266,

and the party organization of the Guelfs (*parte Guelfa*) effectively dominated the Florentine government from 1267 to 1280. After 1267, the dominant Guelfs became more and more an amalgam of well-to-do *popolani* (particularly leaders of the craft guilds) with members of the traditional aristocracy, enriched by rental and commercial income.

In Bologna there was a similar pattern of development. There, as in Florence, one of two traditional factions of the nobility gradually sided with political organizations associated with the *popolo*. Arezzo had two Guelf parties by 1249. An alliance between the *popolo* and the Guelfs at Siena is attested to by the constitutional reform of 1271, a decade after such a bond first appeared in Florence. This political alliance between the Guelfs and the principal merchants of the commune helped sustain a political system in Siena that lasted until the mid-fourteenth century. For most of the remainder of the thirteenth century in Tuscany, the principal Guelf communes (Florence and Lucca) were often in conflict with the Ghibelline regimes in Pisa and Arezzo for commercial, military, and political advantages in the region.

With the collapse of an effective imperial challenge to communal autonomy in Italy after the death of Frederick II (1250) and the defeat of Manfred at Benevento in 1266 and of Conradin in 1268, the Guelfs lost more and more of their original identity as an anti-imperial tradition advocating communal autonomy. After 1268, the Guelf cause became identified primarily with protecting and promoting the political and economic alliance uniting Florence, the Angevin regime in southern Italy, and the papacy. The papacy had petitioned Charles of Anjou, brother of King Louis IX of France, to oppose the imperial claimant Manfred in southern Italy in 1266. Charles ultimately became the ruler of Naples and principal protector of papal interests in Italy. Florentine bankers had strong economic ties with both parties. They helped finance the Angevin conquest of southern Italy, and they became the bankers of the popes. At the same time Florence became increasingly dependent on grain imported from southern Italy to feed its population; thus its fate was tied to preservation of the status quo in southern Italy and to protection of the interests of the papacy. Increasingly, in Tuscany, Ghibellinism therefore meant opposition to Florentine hegemony. Florentine Ghibelline exiles, whose confiscated property after 1266 helped stabilize the Guelf regime, made common cause with

the imperial vicar living in San Miniato al Tedesco and the Ghibelline communes of Pisa and Arezzo. Between 1288 and 1292, Florence fought a series of wars with Pisa and Arezzo, the two principal Ghibelline powers in Tuscany. The Florentines' defeat of Arezzo at the battle of Campaldino in 1289 put an end to a major Ghibelline challenge. Between 1295 and 1300, the Florentine Guelfs themselves split into rival factions, the Blacks and the Whites. The Blacks, supported by Pope Boniface VIII, took control of the city and managed to expel the Whites in 1302. Prominent among those expelled was Dante Alighieri. The Whites supported the Ghibelline exiles and called for a restoration of imperial authority in Italy. Guelf associations in Pistoia and Lucca also split into rival Black and White factions at the same time.

After 1268, Guelf organizations spread throughout Lombardy with the support of the papacy and Angevins. Many prominent cities in the north (Modena, Ferrara, Parma, and Bologna) were Guelf. In Lombardy, as in Tuscany, the conflicts between rival communes during the second half of the thirteenth century increasingly transcended the traditional allegiances—imperial versus papal. For example, when Obizzo II d'Este of Ferrara supported Ghibelline Verona against other Guelf communes in 1289, he effectively scrambled the old alignments of the Guelfs and Ghibellines. In the succeeding decades, the traditional allegiances with pope or emperor were less and less important to the conflicts between Lombard communes.

By the early decades of the fourteenth century, therefore, the Guelfs had lost most of the original ideological orientation that had characterized them in the thirteenth century. However, the presence of Henry VII (r. 1308–1313) in Italy revived the traditional concepts of Guelf and Ghibelline and reignited old conflicts. Henry's decision to come to Italy to be crowned emperor in 1310 forced political factions within the communes to choose sides again. Florence, alarmed at the threat posed by Henry's presence in Italy and by the favoritism he showed to Ghibelline exiles in the north, continued to be the chief defender of the Guelf network of alliances. Henry died in 1313, a year after he had been crowned emperor and had laid siege to Florence. Several years later, Ghibellines championed the cause of Lewis of Bavaria in Italy. However, this imperial revival was short-lived.

In the fourteenth century, intellectuals like Bartolus of Sassoferrato

and the Lombard Pietro Azarii came to acknowledge that the rivalry between pope and emperor was not at the heart of the conflict between the Guelfs and Ghibellines. Indeed, Italian writers increasingly recognized, during the second half of the fourteenth century, that the struggle was actually between groups contending for local political and economic advantages. "Guelf" had become synonymous with support for the alliance between the Angevin court in Naples (and its connections with the French royal house), the papacy, and the network of Guelf communes led by Florence.

The axis constituted by the papacy, the Angevins, and Florence came under increasingly severe strains during the remainder of the fourteenth century. In Lombardy' during the first third of the fourteenth century, the split between the papacy and the Estensi over Ferrara continued to divide the nominally Guelf communes of the region. Furthermore, the Florentines, beset by economic problems, a growing deficit, and other internal crises, no longer saw themselves as leaders of the Guelf alliance in Italy. In Naples, the death of Robert of Anjou in 1343 was followed by a century of political conflict and turmoil. Also, the papacy was in residence at Avignon for most of the century, far from its former Guelf allies. Its growing estrangement from Florence eventually led to war in 1378 (the "war of eight saints"). By the end of the fourteenth century, in several cities, "Guelf" had effectively become a convenient label that simply signified fidelity to a status quo rooted in a past political tradition.

Guglielmo Da Pisa, Fra

Fra Guglielmo (fl. 1260s-early 1300s) was a Pisan sculptor who, according to early sources, collaborated with Nicola Pisano and others on Saint Domenic's tomb for San Domenico in Bologna in 1267. Guglielmo, who was deeply influenced by the early classicizing style of Nicola Pisano, became a successful independent sculptor, active in Pistoia and Pisa. In the 1290s, he is recorded in connection with Pisa's principal Dominican convent, Santa Caterina, to which he was also attached as a lay brother. Today he is best remembered for an impressive pulpit in San Giovanni Fuorcivitas in Pistoia, which once bore the name Guglielmo and the date 1270. He may have been involved in the sculptural decoration of the facade of San Michele in Borgo in Pisa, since an inscription (now lost) referred to a Guig-lielmus and the carvings themselves show affinities with the pulpit in Pistoia. Other projects in Pisa with which he is associated are the design of the

facade of Santa Caterina and Cimabue's apse mosaic in the *duomo*, for which a certain Frater Guiglielmus delivered an amount of tesserae in 1301.

Given the paucity of securely identifiable surviving work by Fra Guglielmo, the pulpit in Pistoia provides valuable insights into his artistic career. It is rectangular in plan and has two tiers of reliefs depicting episodes from the lives of Christ and the Virgin. This design—perhaps in accordance with the patron's wishes—follows the general configuration of Guido da Como's earlier pulpit in the nearby Pistoiese church of San Bartolomeo in Pantano (1250). Another possible model, however, might have been Guido's pulpit for the *duomo* of Pistoia that was dismantled in the 1500s. Fra Guglielmo's carving is accomplished and assured in its degree of expressive undercutting, which endows the figures with a powerful plasticity that is in tune with the antique-inspired traditions of Tuscan Romanesque and Nicola Pisano's art. Allied to the animated effects of chiaroscuro brought about through the varied relief are rich effects of color and pattern, since the narrative backgrounds glisten with polychromatic glazes.

Guido D'arezzo

Guido d'Arezzo (Guido Aretinus; c. 991 — 1050) was an important Italian music theorist. The circumstances Guido describes in the prefaces to his treatises place his activity in Arezzo, Pomposa, and Rome c. 1025-1032. Four treatises can be attributed to him: *Micrologus* (between 1023 and 1032, perhaps 1025/1026); *Prologus in antiphonarium* (later than *Micrologus*); *Regule rhythmicæ* (later than *Micrologus*); and *Epistola de ignoto cantu* (later than *Prologus* and *Regulae rhythmicæ*).

In *Micrologus*, Guido surveyed, principally, the music theory that would be of use to a practicing musician. He described a scale extending from G at the bottom of the modern bass-clef staff to C in the third space of the treble, including all natural notes plus B-flat below middle C, and presented them in a tuning with all perfect fifths pure. With the addition of B-flat above middle C and of the high D and E, this scale and this tuning (the latter since called Pythagorean) became the standard of the Middle Ages. Guido enumerated and described the six intervals most typically used in plainchant and early medieval polyphony (major and minor seconds and thirds, perfect fourths and fifths). He presented the basics of the theory of melodic modes, first explaining the classification of four modal types on the basis of the location of a central tone within the context of a series of major and minor seconds above and below that central tone, and then describing the division of each into a pair differentiated by relatively high or low register. Similar classifications and differentiations persisted in theories of mode throughout the Middle Ages and beyond. He described a procedure for composing a melody by deriving its pitches from the

vowels of the text to be sung. He described the traditional practice of polyphonic composition with parallel fourths and fifths as "harsh" (*durus*) and appended a set of rudimentary counterpoint rules for using other intervals, particularly at the ends of phrases, which produce a result he characterized as "soft" (*mollis*). To all this he added a speculative chapter recounting how Pythagoras discovered the nature of musical harmony by studying the weights of hammers striking an anvil; this story, in one version or another, has since been recounted in dozens of music treatises. *Micrologus* became one of the most widely copied music treatises of the Middle Ages (almost eighty manuscript sources survive), and one of the most influential.

Two of Guido's innovations, however, must be reckoned even more influential than anything he described in *Micrologus*. He seems to have been the first (in *Prologus*) to describe the use of the staff in music notation: the placement, that is, of notes on or between any of a set of parallel lines, with the positions of C's and F's indicated first by the placement of these letters in the appropriate positions at the beginning of the staff (like modern clef signs); and second by the use of the colors yellow and red, respectively, to highlight the positions of the two letters (much as the C and F strings of a harp are colored today). He also seems to have been the first (in *Epistola*) to name the ascending degrees of the C scale *ut re mi fa sol la*, syllables derived from the openings of lines of the hymn *Ut queant laxis/Resonare fibris*...

In *Regulae rhythmicae* Guido reworked in poetic form material he had covered for the most part in *Micrologus*; he also included one example in staff notation.

Writers of a much later date transposed the series *ut re mi fa sol la* to pitches other than C and constructed an interlocking array of such series spanning the entire musical gamut. Although the "Guidonian hand"—a representation of the left hand with the notes of the musical gamut depicted on the various joints of the fingers—was during the Middle Ages and later often attributed to Guido of Arezzo, it is documented only from the twelfth century.

Guido Da Como

The northern Italian sculptor Guido da Como (Guido di Bonagiunta Bigarelli; fl. c. 1238, d. 1257) was born in Aragno, near Lugano, into a family of stonemasons. His activity as a marble carver is recorded in northwestern Tuscany in the important towns of Pisa, Lucca, and Pistoia; but since Guido was a common name among the many marble cutters from Como based in Tuscany, the reference to a Guidus de Como in Barga in 1238 might be to another craftsman.

The earliest secure reference to Guido dates from November 1244, when he was in Lucca and was perhaps involved in work for the cathedral, where a number of other stoneworkers from Como are

recorded. In 1246, he signed the octagonal baptismal font that is still placed at the heart of the baptistry in Pisa. Its polygonal form, which is in harmony with the centralized plan of the building, probably determined Nicola Pisano's choice of a polygonal pulpit for this same space in 1260. Guido's font is characterised by crisply defined floral and figural motifs set within a field of polychromatic geometric intarsia designs. The vigorous relief and precise carving of the rich decorative details of this font were almost certainly influenced by late antique models, which abounded in Pisa.

In 1250, Guido signed and dated the pulpit in San Bartolomeo in Pantano, Pistoia; this is his only other securely identifiable surviving work. Following the tradition of Guglielmo's pulpit for the cathedral in Pisa (now in Cagliari cathedral; 1159— 1162), Guido's pulpit is rectangular and has two tiers of reliefs. Classicizing in style, the carved New Testament narratives manifest a compact solidity of form with sharply incised details that are especially evident in the carefully delineated drapery forms.

Other works in Pistoia, such as an *Angel* (in San Giuseppe) and a series of richly decorated marble panels (in Sant' Andrea), have been associated with Guido on the basis of stylistic affinities with the surviving signed works. He is last mentioned in 1257 in Lucca, where his half-brother Guidobono, a stonecutter, was also residing.

Guido Da Montefeltro

Guido (c. 1220-September 1298) was a successful Ghibelline leader, known as the shrewdest and most talented mercenary captain of his time. He safeguarded Ghibelline interests in central Italy as Guelf power grew. After a lifetime of warfare and strategy, Guido joined the Franciscan order in 1296; he died two years later.

Nicknamed "the fox," Guido achieved a series of military victories through cunning and skill. In 1274, he was summoned to take control of the Ghibelline party of Romagna. In June 1275, his Ghibelline force defeated the Guelf army, killing, it is said, nearly 7,000 Guelfs. In September 1275, Guido again defeated the Guelfs, this time at Raversano, and took possession of nearby Cesena. For years he led Romagna in its resistance against papal power, and in 1282 he successfully warded off the troops of Pope Martin IV, under the command of Giovanni d'Appia, who had attacked Forlì. In 1283, however, Guido was driven out of Forlì by its inhabitants, who had submitted to the church. In 1286, Guido too submitted to papal authority, but he was banished to Piedmont. Two years later, he was elected commander of the Pisan Ghibellines. Defying his banishment, Guido returned from exile and was consequently excommunicated.

Under his leadership the Pisan Ghibellines won decisive victories against the Florentine Guelfs; but when the two cities made peace in 1293, Guido was dismissed. In 1292, Guido made himself master of Urbino and defended the city from the attacks of Malatestino di Rimini. Also in 1292, he began his attempt to be reconciled with the church; and in 1296 he entered a Franciscan order, in which he led an austere existence until his death. He died in a Franciscan monastery in Assisi or Ancona.

A debatable event in Guido's biography provided the basis for Dante's portrayal of him as a false counselor in *Inferno* 27. In Dante's narrative, after Guido became a Franciscan friar, Pope Boniface VIII solicited his advice regarding the pope's struggle against the Colonna family, promising him absolution from any sin he might commit. Dante recounts that Guido counseled the pope to make false promises to the Colonna, and this encouragement of double-dealing earned Guido a place among Dante's fraudulent counselors. The historical foundation for this account is unclear. It is true that Boniface promised amnesty to the Colonna and then razed their stronghold, Palestrina; and the story was repeated as fact in chronicles that followed the *Inferno*. However, it has proved difficult to find reports of Guido's involvement with Boniface that definitely predate the *Inferno* and thus would show that Dante did not invent the episode. The chronicle of Riccobaldo of Ferrara, which details the exchange between the strategist and the pope in language that strongly resembles Dante's, may predate the composition of the *Inferno*; moreover, Dante had called Guido "our most noble Latin knight" in an earlier work, the *Convivio* (4.28.8), and this may lend credence to the idea that Dante's exalted view of Guido was altered by the damning information in Riccobaldo's chronicle.

Guido's son, Buonconte da Montefeltro, was killed at the battle of Campaldino in 1289 and is mentioned by Dante in *Purgatorio* 5.

Guido Da Siena

Guido da Siena (fl. c. 1250-1280s) is the first Sienese artist for whom a specific name is known and is generally regarded as the founder of Siena's important school of late medieval painting. Guido is considered among the most important and prolific painters in the generation before Duccio di Buoninsegna; in fact, Duccio may have been an apprentice in Guido's workshop. Compared with Duccio, however, very little is known about Guido. What modern art historians do know comes from only two inscriptions and a body of work that is associated stylistically with Guido and, presumably, his pupils; no documents of commissions, payments, or tax declarations or other contemporary references have surfaced. Guido's name appears in the inscription at the base of a large Madonna and Child in the Palazzo Pubblico of Siena. This inscription also carries the date 1221; thus for many years it led art historians to date Guido and his work, precociously, in the first half of the thirteenth century. That early placement was abandoned in favor of the second half of the thirteenth century once Guido's works were compared stylistically with those of painters such as Coppo di Marcovaldo and Cimabue from Florence and Guido's younger Sienese contemporary, Duccio. Guido is now regarded as a close contemporary of Cimabue,

with whom he seems to have exchanged artistic ideas.

With Guido's historic and art-historic context established, scholars have surmised that he was born c. 1240 and that, given the nature of his early works, he received his artistic training in Lucca in the 1250s. By the 1260s, Guido was probably an independent master; soon thereafter, he stood at the head of a large and productive shop working in an advanced Italo-Byzantine style. Guido's art is perhaps best-known from the Madonna and Child in the Palazzo Pubblico. This is a large altarpiece (more than 13 feet, or nearly 4 meters, high); throughout the sixteenth century, it was in the Capacci Chapel in the church of San Domenico. The Madonna is now dated to c. 1280 and should be considered roughly contemporaneous with Cimabue's Santa Trinita Madonna and only a few years earlier than Duccio's Rucellai Madonna (both in the Uffizi, Florence). But major parts of Guido's altarpiece (particularly the faces of the Madonna and child) were obviously repainted during the early fourteenth century in the later manner of Duccio, and it is therefore difficult to appreciate the fullness of Guido's art in this work. Only the jagged though decorative piping line on the Madonna's mantle, the drapery folds of Christ's robes, and the animated, brightly colored angels at the summit of the altarpiece are distinctly of the late thirteenth century and demonstrate the extent to which Guido laid the foundations for Duccio and his school in terms of decorative energy, chromatic richness, and narrative intensity. More characteristic of Guido's art is a small narrative panel of the Annunciation (now in the Princeton University art museum). Guido's last works seem to date from the 1280s, a decade during which Guido and the younger Duccio may have provided each other with artistic stimulation.

Guido Delle Colonne

The thirteenth-century judge Guido de (or da) le Colonne di Messina is referred to by Dante in *De vulgari eloquentia* as *Iudex de Columpnis de Messana* or simply as *Iudex de Messana*. Guido's name appears in a total of fifteen documents, some of them bearing his signature, issued in Messina between 1243 and 1280. This documentary evidence testifies to his activity as a judge in that city. Since he was acting in a professional capacity as early as 1243, he must have been born c. 1210; this date makes it rather unlikely he could be identical with a Guido de Columna who was the author of a Latin version of Benoît de Sainte-Maure's *Roman de Troie*, begun in 1272 but not finished until 1287. Bertoni (1947) accepts this identity, however, thereby placing Guido's poetic activity during the Manfred era. Guido's birthplace is unknown; there is nothing to support Monaci's claim (1955) that Guido was descended from the Colonna family in Rome, nor do we have any firm proof that he was related to the other poet of the same name in Messina, Odo delle Colonne. Nothing is known about Guido's personal life. His poetic legacy consists of only five *canzoni*, of which one—*La mia vit' è sì fort' e dura e fera* ("My life is so harsh and fierce")—is of uncertain attribution; it is described as anonymous in the Vatican Codex (Vat. Lat. 3793) but is given to Guido in the Palatine Codex (Florence, Biblioteca Nazionale Centrale, Banco Rari 217, formerly Palatino 418). Included in this count is the poem *Gioiosamente canto* ("Joyously I sing"), which scholars almost unanimously assign to Guido on the strength of the attributions proposed by the most reliable manuscripts (Vatican 3793 and Laurentian Redi-ano 9); but many other codices, among them the Palatine, Chigi-ano L.VIII.308, and Vatican 3214, concur in giving it to Mazzeo di Ricco, who may simply have been the recipient rather than the author of the poem.

Although Guido delle Colonne's lyrical production is thus very

modest in scope, his poems rank among the most technically elaborate of the Sicilian school. Guido treats the traditional amorous themes with exceptional rhetorical skill and has at his disposal an impressive fund of abstract imagery that enables him to bring variety to even the most conventional motifs. His rhetorical resources and his technical virtuosity drew high praise from Dante, who, in *De vulgari eloquentia*, cites two of Guido's poems as particularly elegant: *Amor che lungiamente m'hai me- nato* (Love who has driven me for a long time) and *Ancor che l'aigua per lo foco lassi* ("Although water, because of fire, loses"). The second of these *canzoni* is quoted as an example of *suprema constructio* because of its structural complexity and its difficult rhyme scheme. Whereas the Sicilians treat the motifs of atmospheric and other natural phenomena merely as part of a comprehensive repertoire designed to offer an illustration of the prevailing cultural-philosophical climate, Guido delle Colonne is able to move beyond loosely connected encyclopedic detail to express subtle analogies between a variety of natural phenomena, and he skillfully applies these images to the nature of love. A prime example of his virtuosity in dealing with these motifs is the poem *Ancor che l'aigua per lo foco lassi*, with its intricate associations of fire and snow. It is from this *canzone* that Guido Guinizzelli drew the inspiration for his poem *Al cor gentil ripara sempre amore* ("Love always dwells in the noble heart").

Guido Faba

Guido Faba (before 1190-c. 1248) was born in Bologna and was a *magister* of the rhetorical *ars dictaminis* there by 1210. He then apparently studied law, and in 1215 and 1219-1220 we encounter him as a notary; he began to serve the bishop of Bologna in that capacity in 1221. Guido entered the clergy in 1224-1225 and became a priest and chaplain in the chapel of San Michele di Mercato di Mezzo. This chapel was associated with a hospice for students and a school of grammar and *dicta-men*, in which Guido also served as a professor. He possibly taught in Siena in 1242-1243. He died in Bologna soon after 1248.

Guido's major works mostly focus on various aspects of *ars dictaminis*. *Exordia* (his earliest work; second version c. 1229) and *Gemma purpurea* provide introductions for letters, carefully adapted to the subject matter of the missive and the social status of the addressee. In his *Summa de vitiis et virtutibus*, the model introductions take as their themes the vices and virtues, which have been discussed in brief preceding tracts and definitions. *Arengae* is a collection of introductory

phrases suitable for both letters and speeches, and a second edition (1240-1241) contains complete speeches. Complete sample letters are provided in *Dic-tamina rhetorica* (c. 1226-1227); and *Parlamenta et epistole* (c. 1242-1243) offers models usable for both speeches and letters. Guido's most sustained theoretical discussion of *ars dictaminis* is to be found in *Summa dictaminis* (c. 1228-1229). After a discussion of vices and virtues of style, he offers a broad definition of *dictamen* and proceeds to outline the three principal parts of the letter: introduction, narration, petition. This threefold division is similar to that provided by Buoncompagno in *Palma* (c. 1198); although Buoncampagno identified the salutation as the first principal part, he used the same metaphor that Guido invokes—foundation, walls, and roof. Guido goes on to detailed discussions of the various main and subsidiary parts of a letter; the precepts on the salutation are complemented by models, which include salutations suitable for various phases of a love affair. After an extended section on matters of style, Guido offers his readers a collection of biblical maxims and a series of exercises and sets of sample introductory phrases for letters to persons of different social status. He rounds things out with a short discussion, accompanied by examples, of the composition of ecclesiastical and secular privileges. Another brief excursion into *ars notaria* is provided in Guido's *Petitiones* (c. 1230), in which he offers models for documents related to canon law procedure, particularly appeals to the Holy See.

Judging from the number of surviving manuscripts of his works, Guido appears to have been the most influential of the three Bolognese *dictatores*—himself, Buoncompagno da Signa, and Bene da Firenze. In his writings, Guido emphasized practicality rather than playful literary elegance or creative originality. He favored varied examples over extensive theoretical discussions, and his model letters were straightforward rather than fanciful and thus could be used directly, with only minimal adaptation. Moreover, in *Summa de vitiis et virtutibus*, *Gemma purpurea*, and *Parlamenta et epistole*, he also offered models in the vernacular, responding to a contemporary need created by its increasing use in official communications, and incidentally providing us with early examples of literary Italian.

Guido Novello Da Polenta

Guido Novello da Polenta (d. 1330) was the nephew of Francesca da Rimini. Guido became lord of Ravenna in June 1316, succeeding his uncle Lamberto. According to Boccaccio, in *Trat-tatello in laude di Dante* (*Treatise in Praise of Dante*, 12), Guido was *ne'liberali studi ammaestrato, sommamente i valorosi uomini onorava e massimamente quelli che per iscienza gli altri avanza-vano*: "learned in the liberal arts; he greatly honored worthy men and especially those who surpassed their peers in knowledge." Indeed, Guido is best remembered as Dante's last patron, having offered hospitality to Dante from 1317 until the great poet's death in 1321.

Guido too was a poet, in the *stilnovo* tradition. His seventeen poems (sixteen *ballate* and one sonnet) deal exclusively with the theme of love and are contained in the Escorial manuscript {Escorialense Lat. e.III.23}. The prevalence of the *ballata* form is appropriate to his elegiac descriptions of love. Guido's poetic voice is not unique, but it is so graceful and clear that Guido can be considered one of the most eloquent followers of Dante. The *ballata* *Nov'entelletto move 'l meo desire* ("A new understanding moves my desire") is one example of Guido's eloquence. There is little drama in his poems; rather, his *ballate*—such as *Un penser ne la mente mia se chiude* ("A thought enclosed in my mind") and *Madonna per vertute* ("My lady through virtue")—are stylized representations that reflect a genuine concern for aesthetic measure. This concern results in subtle but noticeable shifts in his poetic voice. The gerund in the *incipit* of *Lacremando lassasti gli ochi mei* ("You left my eyes weeping") and the direct discourse in *Dixem'Amor: "Questa donna più vol te"* ("Love says to me: This lady prefers you")

underscore the poet's excitement, yet Guido remains in control of his subject matter. Verses such as *Sì remase del tutto abbandonato/lo meo entelietto e la mente smarrita,/che non ho più valore* ("My love is so completely abandoned and my mind lost that I no longer have any strength," verses 4-6 of *Lacremando*), which might be expected to suggest the poet's despair, are instead gracious entreaties to his mistress. Rather than labeling Guido a mannerist poet, it is more appropriate to consider him a faithful representative of traditional *stilnovo* themes and style. This interpretation accords with his reverence for Dante and with our understanding of the relationship between social nobility and poetry as the language of intellectual elites

Guidotto Da Bologna

Guidotto (fl. late thirteenth century) was a friar in Bologna and probably also a teacher of grammar and rhetoric there; he may also

have taught in Siena after 1278. He is usually identified as the author of *Fiore di rettorica* (dedicated in one version, which thus appears to have been composed between 1254 and 1266, to King Manfred of Sicily); but possibly his is merely a redaction of someone else's work. *Fiore di rettorica* is one of the earliest compendiums of rhetoric in the Italian vernacular; it is primarily a somewhat condensed and modified translation of *Rhetorica ad Herennium*. In its emphasis on oratory, it is part of the tradition of *ars arengandi*.

Guilds

Medieval guilds—*arti*—were self-regulating associations of craft masters, merchants, or professionals organized within cities according to their trades or occupations. The guilds developed from the later twelfth century on, along with a revival of towns and trade and the emergence of urban institutions such as the commune and the noble tower societies. By joining together, members of guilds could regulate many aspects of a given occupation: training and entry, working conditions, competition from within and outside the community, and relations between those associated in the guild and higher feudal, civic, or ecclesiastical authorities.

By the thirteenth century, the guilds in a town played a very important role in its economic, political, and social life. Members of guilds often represented the dominant economic class of the town, and in the later 1200s guild membership was sometimes a prerequisite for participation in government. In an individual's life, too, membership in a guild constituted a primary relationship, which defined many aspects of one's position and role in society. Guilds were also an important source of church and civic patronage and of charity for the poor—charity was always extended to guild brethren and was sometimes provided to people outside the guild. Guilds remained a vital institution throughout the Middle Ages and beyond. By the later *Trecento*, however, many pressures—including economic depression, the rise of signorial government, innovations in business organization, and unrest among unrepresented workers—combined to reduce their effectiveness.

Origins

The Roman empire inherited the institution of the *collegium* from the republic. *Collegia* were associations of craftsmen or employers who practiced the same trade and met for social and religious conviviality. By all appearances, they did not seek to regulate either the occupation or the trade, but they could wield some political or social power through their patron, a wealthy and powerful person not involved in

the occupation. The *collegium* gained the legal status of a person in the mid-second century and increasingly came under control by the state. By the end of the third century, the edicts of Diocletian, and later those of Constantine, had tied artisans and workers (and their heirs) to their occupations and had laid down often strict rules governing the trades that were most important to the state. The *collegia* proved to be a useful instrument for policing regulations and enforcing demands on their members for additional public service.

In the late empire, as public authority, civic life, markets, and trade withered away, the *collegia* all but disappeared. Scanty references to a few apparently organized crafts appear up to the early seventh century, but little is known of their survival. Roman *collegia* were more likely to persist in the parts of Italy under Byzantine control than in the areas overrun by Germanic invaders. Unfortunately, Justinian's code is nearly silent on these associations, and the documentary record provides no more than slight evidence for Byzantine guilds (*somateion* or *schola*) outside Constantinople. Indeed, they may have faded away in southern Italy and the exarchate of Ravenna as well. There is thus little evidence to support the notion that Roman *collegia* were directly connected to later medieval developments.

Traditional Germanic societies had no need for urban craft guilds; but they did produce the *gilda*, a festive gathering of people connected by age or family; the English word "guild" is derived from this term. With Christianization, the *gilda* may have taken on religious elements and overtones. The development of the parish also focused people's attention on their relationship to a single church and congregation, an important non kin association. Oath-taking, typical as it was of German tribal life, was frowned on and was often condemned by both Charlemagne and the church. Associations bound by oath, even for almsgiving, were prohibited by the capitulary of Herstal. A century after Charlemagne, however, the kings in Pavia were organizing certain important occupations into *ministeria*, probably with an eye toward ensuring cooperation of the artisans with the demands of the regime. None of these developments, however, seems to have led directly to the emergence of guilds in Europe after 1000.

Medieval Italian Guilds

The specific origins of the voluntary, oath-bound, self-serving guilds in Italy are lost to history. Notarial evidence is fragmentary, notices in civic records are few, and guild statutory material is generally very late. One may conclude, however, that although some organization of specific occupations may have been imposed by feudal or civic authorities, most guilds evolved from meetings of masters in a particular craft who sought to protect and promote their collective and individual interests in an increasingly complicated world.

By the early twelfth century, towns had grown in area, in population, and in the variety of tasks allowed by an ever more sophisticated division of labor and trade network. Imperial officials, feudal lords, or bishops still had political authority in many places; but the independent commune was developing its challenge by harnessing the economic power of merchants, tradesmen, artisans, and landowners. In some places, the appearance of guilds predates the emergence of the commune; elsewhere, guilds may have formed to protect the specific interests of their members against any threats the communes themselves might have posed. Since landholding nobles often dominated the communes, there is no reason to assume that communal government provided for the needs of artisans and shopkeepers.

Guild organization was established in a set of statutes created and adopted by the association and binding on all members. These were updated periodically, and those that have survived are rarely original and are often quite late (later thirteenth century and early fourteenth). One or a few of the most prominent guildsmen served as executive officers (consuls, priors, rectors); they were usually elected for one-year terms. Often there was also a council that aided the executives and arbitrated or judged cases involving members. A guild might have a separate court or tribunal, and normally it also employed one or more notaries and messengers. In most respects guild organization directly paralleled that of the commune.

It was unusual for statutes to regulate the apprenticeship and employment practices of individual members very closely, but some rules did apply. Direct relatives of the members were always given the highest priority in apprenticeships, sometimes by statute. Children

could be apprenticed at a very young age (between seven and ten years was often a statutory minimum), and parents signed contracts, initially based on rental agreements, to place their children with masters. These agreements, not statutes, regulated the apprentice's life. The child was to be exposed to a valuable educational experience, and the master retained a bound shop servant and, after a few years, a valuable employee. The statutes could limit the number of apprentices a master might support, or the number of journeymen—trained workers who labored for a daily wage, hence the term (from *giorno*, "day")— he could hire. Occasionally, the statutes also controlled hiring practices by setting maximum wages and forbidding unfair luring of workers by masters from other masters.

Guilds fell into three categories: craft, merchant, and professional. Craft guilds normally included all the masters in a given field, and sometimes journeymen and even apprentices were enrolled. The masters, however, dominated guild affairs, and so the guilds represented the rights and interests of the employers and only incidentally those of the workers. Within a guild, a number of specific, and sometimes apparently unrelated, crafts were included. This may have resulted from an initial grouping for greater strength, or from later reorganizations, as when the twenty *arti minori* (lesser guilds) of Florence were fused into nine under the direction of Giano Della Bella in the 1290s. In 1330, Pistoia had eight guilds representing forty-six occupations; at about the same time, tiny Pescia in Tuscany had ten guilds encompassing twenty-one occupations. This variety could result in the domination of a guild by members of its most important or wealthiest component. In many cases, craftsmen broke away from more comprehensive merchant guilds in the late twelfth or early thirteenth century and formed their own—thus increasing their freedom of action. In Milan in 1198 the Credenza of Saint Ambrose, which embodied the artisans and minor merchants, split off from the authority of the Motta, the organization of the greater merchants and knights. In any case, the masters who were wealthier or had larger operations carried greater weight within the guild and tended to control its actions and policies.

Each town or city had its own collection of craft guilds that reflected its particular resources, local economy, and history. Typically, however, a town would have guilds of bakers, smiths, cloth sellers, butchers,

victuallers, masons, carpenters, millers, painters, and shoemakers, among others. After the fusion of the twenty Florentine *arti minori* under Giano Delia Bella, the nine resulting guilds were headed by, respectively, the wine sellers; innkeepers; sellers of salt, oil, and cheese; tanners; armorers; ironworkers; girdle makers; woodworkers; and bakers. In the 1230s, San Gimignano had only four guilds: furriers, drapers, shoemakers, and victuallers. By 1258, it had added smiths, butchers, animal sellers, and carters. After 1258, the wool cloth producers, tailors, carpenters, masons, and barbers, along with merchants, judges, and notaries, organized themselves.

Craft guilds had several economic functions. By limiting apprenticeships and accepting (or rejecting) a masterpiece from a journeyman, or otherwise scrutinizing his skills or credentials, a guild effectively controlled access to the market. Through its statutes, it could regulate competition, quality, quantity, and working conditions. Masters were not to collude to fix prices, and unfair advantages were attacked by controlling fraud and sharp business practices. Cloth sellers in Rome, for example, were not to interfere with a customer who was examining a competitor's product. Quality and workplace standards were often found among a guild's statutes, but these had sometimes been preceded by a commune's standards or regulations. Practical considerations militated against locating tanneries, with their noxious smells, inside towns long before their own rules dictated a location away from the populace. Communal concerns for health and fairness also combined with business interests to control the use of false weights and measures, the sale of spoiled or adulterated food, or the practice of noisy occupations at night. Although guilds usually maintained a monopoly on a given occupation within a town, maintenance of fair competition among masters was a principal goal.

Professional guilds were limited to those whose members generally had academic qualifications or the equivalent in experience. The most common of these guilds were judges and notaries, physicians (often along with apothecaries), and, in cities with universities, members of faculties.

Merchant guilds were often the earliest urban guilds to develop. Piacenza formed one of the oldest, documented in 1154. The Milanese followed suit by 1159 and the Florentines by 1182. These large and

inclusive guilds began to split into smaller ones between 1190 and 1220 in Lombardy, and in the mid-thirteenth century the Roman guild of merchants spawned at least five lesser guilds. In virtually all cases, the merchant guild remained the local powerhouse, since it encompassed the wealthiest international merchants, who often also served as bankers and were large-scale landowners.

Guilds and Civic Politics

In thirteenth-century Siena, the merchants and bankers were organized into the Mercanzia, a guild that overshadowed all others. It was instrumental in reorganizing the civic government in 1287, and its consuls (four elected executive officers), along with the *podestà*, were responsible for choosing the first six members of the new *signoria* (governing body), known as the Nine. Until its fall in the mid- *Trecento*, the Nine routinely included several if not all of the Mercanzia consuls, and government policies consistently reflected the interests of the great merchants and bankers.

Guilds of all types proved from the beginning to be convenient and effective units around which to organize representation of the commune and later the *popolo*. The community of interests within the guild was transferred to the broader political field, and early militias often trained and were mustered according to guild. Since guild members could live anywhere in a town, however, they were hard to gather on the spur of the moment. Thus arose the broader popular movement of the *popolo* that pressed for greater representation of the merchant and artisanal classes against the entrenched power of the nobles in the communal government. In some ways the development of guilds paralleled and complemented that of the "tower societies," which focused the nobles' power around clan enclaves and their tall square towers that punctuated the skylines of many cities. At the same time that the lesser guilds were splitting off from the merchant guilds, both were struggling for power against the nobility, often in the streets. The 1190s saw many such clashes: in Brescia (1196), Piacenza (1198), Milan (1198-1201), and Assisi (1198-1202); and between 1200 and 1212 in Padua, Cremona, Lucca, and Siena. The rectors or consuls of guilds

gained seats on the ruling councils of Brescia, Milan, Piacenza, and Cremona in the early 1220s; in Bologna in 1228; and in Parma in 1244.

Florence: A "Guild-Republic"

The political history of medieval Florence from the mid-thirteenth century on is bound up with the history of its guilds. Its oldest documentation dates to 1182, with mention of the *societas mercatorum* (guild of merchants), later known as the Calimala and associated especially with the wool trade. The money changers (*cambiatori*) broke away from this guild in 1202. The earliest notice of craft guilds is from 1193. The wool guild (Arte della Lana) began in 1212, and the shopkeepers and silk guild of Por Santa Maria in 1218. The first record of the guild of judges and notaries is dated 1212. These five plus the guilds of the furriers and of the physicians and apothecaries constituted the *arti maggiori*, or major guilds.

The *primo popolo* of 1250 that overthrew the noble-dominated Ghibelline government of Florence was organized around the guilds; and except for a six-year hiatus of Ghibelline rule (1260-1266) the Florentine government was led, until and beyond the end of the Middle Ages, by the leaders of the *arti maggiori*. In 1282, the seven guilds elected six representatives to serve as priors to run the state for a two-month term; these priors then elected their own successors. The five *arti medie* (middle guilds)—blacksmiths, builders, butchers, shoemakers, and cloth retailers—later joined these seven in stocking the priorate. With the Ordinances of Justice of 1293, the lesser guilds were reorganized and gained a voice, if not ruling power. At the same time, guild membership and participation in a trade became a prerequisite for holding office in the state, a means of excluding the nobility and enhancing the role of the guilds. Nonetheless, this system was far closer to a corporate oligarchy than to a popular democracy, since it was led by the elite of the seven chief guilds. As Florence expanded territorially in Tuscany in the middle and late *Trecento*, most of the communes it absorbed were expected to have their guild members enroll in the equivalent Florentine associations. Although this was seen by some as coercive, it would have been the most effective way to introduce the

subjugated communes into the political life of Florence.

Venice: Tying the Guilds to the State

The Venetian experience with guilds was very different from that of most other places in medieval Italy and thus provides some interesting points of comparison. Like Genoa, another maritime power, Venice did not have a merchant guild. In both cases political history had precluded the need for a separate association for international shippers, since the state itself was from an early point directly controlled by the wealthy businessmen, and thus their interests were intimately tied to state policy. In Venice, the senate was essentially the board of directors for the maritime enterprise.

Arti, or craft guilds, emerged in the twelfth century; but from 1173 on, the state directly oversaw these through the operations of the *giustizia vecchia*, a board that registered guilds, sanctioned their statutes, and protected consumers. In 1261, a separate *gius-tizia nova* began regulating sales of foodstuffs. Between 1218 and 1330, the *giustizia vecchia* registered fifty-two craft guilds (compared with thirteen in Bologna and thirty in Florence). Many of these were involved with the greatest medieval industrial operation, the Arsenal. Since shipbuilding was a vital state interest, close supervision of those involved seemed natural. Those who inspected the work of the guildsmen had their own guilds.

In Venice, a guild's judicial decisions could be appealed to the *giustizia*; this unusual feature further demonstrates the close link between the state and its guilds. The annual chief elected officer of the guild was the *gastaldo*, who was responsible not to the membership but to the civic magistrates. Many of the guilds owed specific service to the state, especially during emergencies, and after 1270 the guildsmen took oaths of loyalty not to the brotherhood but to the state. And yet the guilds did not play a role in the direction of Venice: with the *serrata* of 1297, in the same decade that saw the incorporation of even the lesser guilds into Florentine politics, the Venetian state specifically excluded from political power any and all guildsmen.

Social and Religious Aspects of Italian Guilds

Like the ancient *collegium* and the Germanic *gilda*, the medieval guild embodied the idea of brotherhood (and occasionally sisterhood). In Christian Italy, however, drunken feasting gave way before organized religious rituals and participation, in a corporate way, in the acts of corporal mercy expected by the church of good Christians. The original guilds without doubt had as one of their functions the mutual support of members and their families, through monetary charity, prayers, and burial. Later guild statutes often contained very clear statements of these obligations. In many cases, the best-articulated of these statutes had to do with attendance at and participation in the burial of fellow guildsmen. Financial aid for a brother who had fallen on hard times, or for his widow or orphans, had to be treated case by case, but aid was expected: such aid constituted both a social and a religious act of charity. Support for mendicant religious and other poor folk was usually channeled through lay confraternities, which were often directly connected to the guild, and provided a specifically religious forum for the brotherhood.

Only the greatest guilds had their own halls; most guilds met in churches or chapels, for both prayer and business. Since Christianity pervaded civic life in Italy, it naturally played a large role in guild life. Guild statutes and oaths—like virtually all types of civic and even personal business documents—began with invocations of saints or of God's love or power. Jews, always a marginal element in medieval society, were universally excluded from guilds. Church feast days and Sundays were consistently observed in the statutes as days of no work. Guilds were expected to participate, often with great pomp, in the feast days of civic patron saints and the patron saint of the guild or confraternity.

A great deal of later medieval art owes its existence to guild patronage. Through the brotherhood, many small donations could amount to a sizeable sum; and paintings, stained-glass windows, and statues were commissioned to decorate the church in which the brotherhood met or its own chapel in a church. The decoration of the exterior of the Florentine church of Or San Michele, which consists of masterpieces of early *Quattrocento* statuary commissioned by each of

several guilds, is a unique memorial to, and a culmination of, the combined civic, religious, and fraternal impulses that the medieval Italian guilds engendered and embodied.

Guinizzelli, Guido

The Bolognese poet and jurist Guido Guinizzelli (c. 1230— 1276) is the first great poetic figure associated with the *do Ice stil nuovo*. Although he was once thought to have been from the de' Principi family, his family was most likely the Magnani. His grandfather, Magnano, was a prosecutor for the Bolognese commune; his father, Guinizello di Magnano, was appointed to the council of the people and served as a judge and later as *podestà* at Narni. Guido Guinizzelli was evidently the eldest of six children. He married Beatrice della Fratta in 1272, and their son Guiduccio was born the following year. Guinizzelli led an active professional and political life. He was a member of the Ghibelline Lambertazzi party and was banished, with his brothers Giacomo and Uberto and his son Guiduccio, by the victorious Guelf Geremei party in 1274. He chose Monselice near Padua as his place of exile and died there.

Guinizzelli's poetry comprises five *canzoni* and fifteen sonnets confidently ascribed to him, two fragmentary poems, and four *canzoni* whose authenticity is disputed. Most of the authentic poems appear in one or more of three great early (late thirteenth- or early fourteenth-century) manuscript anthologies of Italian lyric poetry. Two of these anthologies are in Florence: Rediano 9 (Laurentian Library) and Banco Ran 217 (Biblioteca Nazionale Centrale). The third is in the Vatican Library (Latino 3793) and in later collections—for example, Chigi L.VIII.305 (Vatican Library) and the Raccolta Bartoliniana (Accademia della Crusca, Florence). Each poem has a separate, often complex, textual history, and no reliable chronology can be established. Guinizzelli's verse techniques are generally conservative, and his language incorporates forms from Sicilian, Provençal, Tuscan, Latin, and French

sources. All the poems aim at musical effects, but they vary greatly in style. The opening *sententia* and moralizing tone of the *canzone Tegno di folle 'mpres', a lo ver dire* ("I think a man foolish, to tell the truth") echo contemporary Tuscan poets, especially Guittone d'Arezzo. The themes, diction, and syntactic complexity of *Madonna, il fino amor ched eo vo porto* ("My lady, the perfect love I offer you") recall the tradition of Sicilian-Provençal poetry. Sonnets like *Pur a pensar mi par gran meraviglia* ("It seems a great wonder to me merely to think") and *Fra l'altre pene maggio credo sia* ("Among all evils I believe the worst") are examples of didactic lyrics in the middle style, whose subject matter Dante (*De vulgari eloquentia*, 2.2.6-10) identifies as virtue. *Volvol te levi, vecchia rabbiosa* ("May a whirlwind strike you, you vicious old woman") is lively, satiric, and vituperative.

The poems associated with the *dolce stil nuovo* represent a quarter of Guinizzelli's extant verse, but on the strength of them Guinizzelli has been regarded variously as a founder or precursor of the changes that occurred in Florentine poetry between 1280 and 1310. His most influential piece is the *canzone Al cor gentil rempaira sempre amore* ("Love returns always to a noble heart"), which announces two important concepts—the coexistence of love and the noble heart and the figure of the *donna angelicata* (angelic beloved). The first concept associates love with nobility and nobility with character. It consequently addresses a question, much debated by classical and medieval writers—whether nobility is determined by one's lineage or one's innate qualities. Unlike his predecessors, who describe a process in which the soul is made noble by love, Guinizzelli argues for a simultaneous appearance: *né ft' amor anti che gentil core, / né gentil core anti ch'amor, natura* ("Nature did not make love before the noble heart, / Nor the noble heart before love"). The second concept redefines the rhetoric of praise. Earlier poets had spoken of the angelic beloved by approximation, addressing her as if she were an angel. Guinizzelli objectifies her as the embodiment of spiritual values who stands between human experience and the abstract truth of divine creation. In contrast to Dante's later formulation of Beatrice, however, Guinizzelli's beloved finally remains secular and earthbound; she has, he says, the likeness of an angel.

To express these concepts, Guinizzelli draws on medieval science and

philosophy, giving the poem a richly allusive texture; and he adopts a style of closely reasoned philosophical argumentation. Love's existence in the noble heart is explained through the Aristotelian-scholastic analysis of potency and act and through the imagery of astral influences imbuing a precious stone with its properties. Love, the poet says, is like fire on the tip of a candle or a diamond in a vein of ore, while the proud man's boast of his heritage is like mud unchanged by the sun's power. The lover's wish to serve his beautiful lady duplicates the movement of the Neoplatonic angelic intelligences who contemplate divine perfection directly and instantly understand its wishes. Guinizzelli also brings to the poem a Franciscan-Augustinian metaphysics of light, which also influences the stilnovist sonnets *Vedut' bo la lucente Stella diana* ("I have seen the bright morning star") and *Io vogl' del ver la mia donna laudare* ("I want to praise my lady truly").

Guinizzelli's innovations in theme and style drew criticism from conservative poets like Guittone and Bonagiunta of Lucca; but Dante admired these innovations, and Guinizzelli's poetic craftsmanship in general. Dante echoes *Al cor gentil* in *Vita nuova* (19 and 20) and cites it in his discussion of nobility in *Convivio* (4.20). Francesca's apology for her adulterous love in *Inferno* 5 ironically echoes it, too. But Guinizzelli's position in literary history was established by Dante's historical representation of him at several points in the *Comedy*. In *Purgatorio* 11 Oderisi proposes a literary succession from Guinizzelli to Cavalcanti to perhaps a greater poet, presumably Dante. In *Purgatorio* 24 Bonagiunta concedes that he and other Sicilian-Tuscan poets fell short of Dante's *dolce stil novo*. In *Purgatorio* 26 Dante greets Guinizzelli as "the father of me and of others my betters who ever used sweet and gracious rhymes of love." Dante's portrayal consciously makes Guinizzelli the originating figure in the thirteenth-century polemic over the Italian love lyric, and it amplifies the break from tradition that Guittone and Bonagiunta saw. Yet Guinizzelli's actual position is somewhat different from either view. A precursor of the new style, he was at once connected to traditional poetic practice and committed to experiment and innovation. Unlike the Florentine poets he influenced, Guinizzelli did sharply distinguish the stilnovist elements of his work from the influence of his Sicilian predecessors or his Tuscan contemporaries. Most scholars emphasize the shifting dimensions of his

work—sometimes prestilnovist, sometimes protostilnovist.

Guittone D'arezzo

Guittone d'Arezzo (c. 1235-21 August 1294) was the master of thirteenth-century literary culture in Tuscany and Emilia. Guido Guinizzelli deferred to his command of style; and Dante, like other poets, experimented with Guittone's formal techniques and elevated tone, striving to surpass his poetic fame and expressivity. In spite of the anti-Guittonean polemic set in motion by the stilnovists, Guittone's corpus of fifty Italian epistles, fifty *canzoni*, and some 250 sonnets—evincing a vast range of formal experimentation, political-moral discourse, and public correspondence—profoundly influenced and altered the course of vernacular literature in Italy.

Guittone probably joined the order of the Knights of Saint Mary (the so-called Frati Gaudenti, "jovial friars") in 1265. This was a turning point in his life and writing; and it is impossible to ignore the other, albeit sparse, biographical data available to us, for in few poets of Guittone's era was the connection between life and literature more keenly developed. Before he took up his literary career in the 1250s,

Guittone had an inside view of municipal politics—perhaps beginning in 1249, when he helped his father in the Aretine treasury. By the late 1250s, Guittone's conservative Guelph values and his dissatisfaction with Arezzo's Ghibelline government led him to seek voluntary exile in places such as Pisa, Bologna, and Florence. Pisa is the provenance of the most authoritative manuscripts of his works: Rediano 9 (Lau-rentian Library, Florence) and its lateral Riccardiano 2533 (Ric-cardian Library, Florence). The wide circulation of Guittone's literary work during his lifetime probably contributed to his stature as the head of an entire poetic movement.

There is no doubt that Guittone was a powerful literary model for thirteenth-century Tuscan poets. He succeeded in converting the detached courtly traditions of the Sicilians and Occitans into a poetry that reflected the political and ethical concerns of the municipal citizen, the pivot of a new Tuscan power structure founded on the sometimes contradictory worlds of Christian morality and the new commercial order. In his writing, Guittone established a delicate balance between wisdom and wealth by emphasizing the ethics of their acquisition and use: *Saver. . . vale in ben condurb... . [N]on peccato in ricchezze è, ma in male aquistarle e male usarle* ("Wisdom is good in that it leads one to happiness. . . There is no sin in riches, but in acquiring and using them evilly," Letter 25). The two polysemous foundations of these ethics, often repeated in Guittone's poetry and letters as *onor e pro* ("honor and profit"), are in fact the classical concepts of *honor* and *utilitas* overlaid with the Christian ideals of goodness and service and adapted to contemporary mercantile notions of family honor and useful efficiency. To this groundwork of a poetics of moral virtue Guittone added a dimension of political philosophy, moving from a defense of collective culture in his early invectives against the Aretines (*Gente noiosa e villana*—"Bothersome and uncourtly people") and the Ghibelline Florentines after the rout of the Guelphs at Montaperti (*Ahi lasso, or è stagion de doler tanto*—"Alas, now is the time of great sorrow") to his later concentration on individual peace as an integral part of the Christian collective (*Magni baroni certo e regi quasi*—"Great barons certainly and kings almost"). Guittone's fusion of rhetorical skill and civil morality solidified, in Italian letters, the perspective of the involved civic poet writing in the vernacular.

Guittone's poetics was equally influential among his contemporaries. It was based on the highly elaborated rhetorical devices of *ars dictandi* and the complicated formalism of the Occitan *trobar clus* (hermetic style). In his poetry and letters, which had a common language and syntax, Guittone's style reflects more than studied and refurbished borrowings of these two earlier traditions. In both cases, Guittone not only reexamines these two sources of knowledge and self-reflection but also tailors them to the cultural needs of the vernacular of his day. Guittone's vernacular exploitation of conventionally Latin-bound rhetoric and his revision of *scuro parlare* (obscure speech) or *trobar clus*, taken in part from his extensive knowledge of Occitan poets (including Raimbaut d'Aurenga and Arnaut Daniel), represents a commitment to link the honored traditions of the past with the language and values of the new power base of the commune. Guittone's discursive investment in literary Tuscan inspired two generations of Tuscan and Emilian literary circles bent on imitating this new, even overextended, attention to the development of a highly articulated poetic language.

Guittone also led the way in challenging other aspects of literary convention. He helped transform the vernacular poem from something composed for performance by singers to a text of writers and correspondents. His refinement of the songbook, or song cycle (conjectured to have been five separate collections), and even its illustration (in *Trattato d'amore*, "Treatise on Love"), and his experimentation with expanded verse forms reveal his involvement in literature not simply as a vehicle for his formal talents but as a committed redefinition of the relationship of literature to its public. This new sense of a public, and of a public sphere, runs throughout Guittone's works, reshaping the narcissistic "I" of courtly lyrics into a self-reflective individual linked to his fellow citizens not through a political faction but through the *polis* or city itself (see Letter 14). In his *canzone Ora parrà s'eo saverò cantare* ("Now it will be evident if I know how to write poetry," written after his conversion), Guittone spells out the four essential elements of human existence: *Natura, Dio, ragion scritta, e comune* ("Nature, God, philosophy, and common sense"). The cohesion of civilization depends on trust and the application of reason. The most basic transgression of that trust, self-

deception, corrupts the entire fabric of civilization: *ché mal l'averebbe d'altrui/chi sé medesimo decede* ("for those who deceive themselves would certainly not have mercy from others," in *O dolce terra aretina*). Thus when Guittone addresses Finfo del Buono (Letter 20), or an infirm brother (Letter 21), or any of his numerous verse and epistolary correspondents (his *societas amicorum*), he also addresses the citizenry at large, embracing the universal within the individual.

However, Guittone was not exclusively a moralist. His early poems treat primarily the theme of love. Three of his five song cycles examine loyalty, joy, and unhappiness in love; the third cycle, partially, takes the form of a feigned debate between a woman and her lover. The sonnet sequence theorized to have been his fourth amounts to an *ars amandi*, dubbed by Avalie a manual of seduction, which is retracted in the fifth cycle (*Trattato d'amore*). Yet even Guittone's love lyrics have a rhetorical cast; their intellectual ardor overwhelms the conventional necessities of tolerance and torment with almost legalistic analyses of the process of love. Sentimental passion seems to be replaced by what Quaglio (1975) calls Guittone's "casuistry of love," in which system dominates the lyric's focus on the moment. Consequently, Guittone's theory of love sometimes reflects moralistic symmetry and a strong sense of reciprocity in a process that helps refine the lover's spirit and nobility. Nobility is no longer defined as a matter of aristocratic lineage; it is now the education of the heart: *Non ver lignaggio fa sangue, ma core*, "The heart, not the blood, makes for true lineage" (in *Comune perta fa comun dolore*, "A common loss makes for a common sorrow").

Perhaps the most significant feature of Guittone's production is its high level of contrast, Guittone startles his reader with unexpected technical and structural revelations to support his repeated messages of peace or—earlier in his career—conventional courtly themes, now adapted to the municipal reader. Guittone's strategy seems to be based on enigmas of faith, echoed in his advice that spiritual richness can be found in only poverty (Letter 3) and happiness only in strife: *solamente apresso travaglio è poso* ("tranquillity is achieved only after strife," Letter 25). Guittone's opus is itself divided between his early verses, described in a sonnet to Monte Andrea (*A te, Montuccio*—"To you, Montuccio") as "poisonous fruits," and his "conversion poems," which are assigned in the manuscripts to "Fra (Brother) Guittone." This

distinction reflects mostly Guittone's entry into the Gaudenti, a lay order known for its religious dedication to pacification and antifactionalism. Yet even Guittone's precon-version works declare the common humanity of all citizens, regardless of faction.

Guittone's poetic trademark is severe rhetorical artifice. In his early poems, this artifice is penetrable only by "those who love": *Scuro saccio che par lo/mio detto, ma'che parlo/a chi s'entend' ed ame*, "I know my writing may seem obscure, except that I speak to those who have understanding and love" (in *Tuttor, s'eo veglio o dormo*, "Always if I lie awake or sleep"). In his later poems it is penetrable by those who have forgone the constraints of love ("where . . . madness reigns," in *Ora parra*). This distinction seems to have been born naturally from a vital contrast in all his poetry between the past and the present. His remembrance of Arezzo's past glories (*O dolce terra aretina/ . . . membrando ch'eri. . . /arec d'onnid ivizia*—"O sweet city of Arezzo . . . when I recall that you contained all wealth") is bitterly countered, in a bold display of rhetorical antithesis, by the city's present "abundance of moral dearth" (in *Or è di caro piena l'arca*). Yet the symbolism of these temporal terms is not static. In the collective conscience, the past—the *benedetto tempo*—recognized the concepts of value and love as distinct from wealth and self-indulgent solitude. But in the progress of the soul, the individual's past represents a worse state of moral ignorance.

Guittone's poetics of formal obscurity is, by contrast, the vehicle for themes often linked by the absolute moral maxims of his political Christianity and the concrete pragmatism of his traditional Guef and mercantile ethos. However, his political-moral writing forges not so much municipal realism, more germane to Monte's poetry, as civic idealism. Nevertheless, he is prone to express these ideals with stormy sarcasm and subtle irony reinforced by a syntax designed to persuade by its brilliantly articulated complexity.

The artistic refutation of Guittone was first voiced by Guido Cavalcanti and Dante. Cavalcanti, in *Da più a uno face un solle-gismo* ("From the many to the one makes a syllogism"), condemned Guittone's literary language, excessively difficult rhymes, and lack of imagination. Dante (who was, like Guittone, an exile) undertook his own stylistic ventures—especially in his *rime petrose* and *tenzoni* with Dante da Maiano. Afterward, in his assessment of the new courtly-literary

language of Italy (*De vulgari eloquentia*, l.xiii.l), Dante dismissed the "municipal" elements in the poetic language of Guittone and Guittone's followers. Dante recognized Guittone's historical stature in *Purga torio* 24, while deriding his notoriety in *Purgatorio* 26. In spite of these early negative judgments, imprints of Guittone's harsh style, polemical and sarcastic logic, and moralistic themes appear throughout the *Commedia* and are ingrained in the poetry of rectitude of the Italian Middle Ages.

Hadrian I, Pope

The pontificate of Hadrian I (Adrian I; d. 795, r. 772-795) was notable for the establishment of the long-hallowed contours of the papal patrimony, for the development of relations between the papacy and the Franks, and for the final emancipation of the papacy from Byzantine authority. Hadrian was born into a noble Roman family and was raised by an uncle who was influential in papal government. Before 767, at the behest of Pope Paul I, Hadrian entered an ecclesiastical career. He was an impressive figure, and his effective preaching, wide learning, and diligence as a papal notary made him popular in Rome. His election to the pontificate in February 772 began an anti-Lombard reaction in the city; exiles were recalled, and the pro-Lombard leader Afiarta was prosecuted for murder, though Hadrian was apparently disappointed when Afiarta was summarily executed in Ravenna.

Hadrian was involved in a dispute with the Lombard king Desiderius over the application of treaties of 754 and 756, by which the Lombards ceded much territory to the papacy; consequently, the pope appealed to Charlemagne (in the spring of 773). After that, Hadrian became embroiled in an extended, courteous debate with the Frankish king over the *promissio donationis*, an oath Charlemagne took at Rome, shortly after Easter 774, by which he granted most of Italy south of the Luni-Monselice line to Saint Peter. After Charlemagne became king of the Lombards (in June 774), he was disinclined to dissolve his kingdom, and in the end Hadrian obtained only a fraction of what had been promised. However, Charlemagne did lead an army south of Rome against Hadrian's hostile Lombard neighbors.

Hadrian's relations with Charlemagne were strained by their different understanding of the privileges and duties of bishops in important Italian sees and were further complicated by Hadrian's

involvement in Byzantine affairs. Although his papal documents were the first to abandon Byzantine dating systems, Hadrian did not neglect the Byzantine world. He participated vigorously in the dispute over icons in the Byzantine empire; he corresponded with the Byzantine emperor and empress; and papal envoys were prominent at the second Nicaean council, which discussed the worship of icons. This openness to Byzantium irritated Charlemagne, who was scandalized by the Nicaean canons; the Latin translation of these canons, prepared in Rome, was garbled (exchanging *proskinesis* for *adoratio*) and elicited a strong response from Charlemagne's court in the form of the *Libri Carolini*. Though Hadrian defended the second Nicaean Council in a letter to Charlemagne, he was unable to avert the condemnation of its decrees by the Council of Frankfurt (794).

Hadrian was a lover of churches, and he built extensively in Rome. His building program included not only churches but also refurbished aqueducts, restored walls, and a portico joining Saint Peter's to the Tiber. He also founded four new *domusculatae*, partly on his family's property north of Rome, to furnish the church with victuals and to nourish the poor. Hadrian was the first pope to mint coins and one of very few popes to put a portrait bust on his coinage.

Hadrian died on Christmas day, or the day after, in 795. Charlemagne, whose ascendancy had influenced Hadrian's pontificate deeply, is reported to have wept on learning of his death. The metrical epitaph the king sent to Rome for the tomb of his "father" can be seen today in the portico of Saint Peter's.

Some of Hadrian's letters (forty-eight) are in *Codex Carolinus*; two other letters are in *Monumenta Germaniae Historica Epistularum*, 5; still others (some spurious) are in Migne. A poem by Hadrian is in *Monumenta Germaniae Historica Poetarum Latinorum*, 1. For synods and councils held during Hadrian's pontificate, see Mansi, A translation of his epitaph is in Gregorovius (1903).

Hadrian II, Pope

During his short pontificate, Hadrian II (Adrian II; c. 792-872, r. 868—872) attempted to continue the policies of his predecessor, Nicholas I, although he lacked Nicholas's forceful character. Hadrian was often called the "new Elijah," but under his leadership the papacy suffered reverses at the hands of Roman factions, Byzantium, and the Carolingian churches.

Hadrian's ascent to the papacy was rapid, and his election was unanimous. However, early in his tenure, factionalism erupted in Rome, which he quelled only after his daughter and wife (he had been before his ordination in 842) were murdered (in 869). Heartbroken and humiliated, he kept to a moderate course and reassured the devotees of Nicholas of his good intentions. Hadrian sought to alienate no one in Rome, while also maintaining good relations with Louis II, whose campaigns in the south might free the papacy from the threat posed by the Muslims.

Hadrian underestimated the Germans' and Byzantines' resistance to Rome's involvement in converting the Slavs. On learning (in June 868) that Patriarch Photius had been deposed, Hadrian denied King Boris's request for a Bulgarian archbishop; Hadrian hoped to subordinate the nascent Bulgarian church to Rome and thereby limit its autonomy. However, the Byzantine clergy, offended by tactless demands for recognition of papal primacy at the Council of Constantinople (869-870), consented to Boris's request and won the king over. Simultaneously, a papal mission to Moravia, led by Saint Methodius (870), floundered, owing to interference by the Germans; Methodius was imprisoned in Bavaria.

Neither did Hadrian have much success in Carolingian affairs. He vacillated when Lothar II pleaded for an uncanonical divorce. When Lothar died, Hadrian supported Louis II to succeed him, but the Gallic

clergy elevated Charles the Bald before papal directives could reach Metz. Hadrian then became embroiled in an epistolary debate with Hincmar of Reims and Charles on the prerogatives of the Gallic church and kings. In this affair, as in others, Hadrian was generally ineffectual and did not wield the power or the influence of his predecessor.

Part of Hadrian's epitaph survives (see DeRossi 1888; Mann 1906); for his surviving letters see Perels (1925).

Hadrian IV, Pope

Almost nothing is known about the birth, parentage, or childhood of Pope Hadrian IV (Adrian IV; Nicholas Breakspear or Brekespear; c. 1100-1159, r. 1154-1159). Most of our information derives from two sources: Cardinal Boso and John of Salisbury.

Boso wrote a *vita* (life) of Hadrian, which is in the collection of Nicolas Roselli, cardinal of Aragon, in 1356. According Boso, Hadrian was born in England near Saint Albans and went to Aries in France to study early in his boyhood. At the monastery of Saint Rufus near Avignon, it is recorded that he took the vows and habit of an Augustinian. After a short time, he was elected abbot of Saint Rufus. On a trip to Rome on business for the monastery, he endeared himself to Pope Eugenius III, who made him cardinal bishop of Albano in 1146.

Pope Hadrian IV. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 202v.

John of Salisbury adds to our knowledge of Hadrian's life at this point, and mentions that Hadrian's father was Robert Brekespear and that Hadrian's original name was Nicholas Brekespear. Another source corroborating this information is in Norway, where Hadrian established an independent archiepiscopal see at Trondheim and made Saint Olaf its patron saint. As a papal legate in 1152, Hadrian also tried to establish an archiepiscopal see in Sweden, but Gothland opposed Sweden regarding where it should be located. Hadrian did, however, reform abuses and establish Peter's pence in Sweden before returning to Rome. In Rome, Hadrian was apparently at the right place at the right time: he was hailed as the apostle of the north; and when Pope Anastasius IV died on 2 December 1154, Hadrian was elected pope on the very next day. He is the only English pope.

Hadrian IV's tenure as pope was fraught with political intrigue and conflict. King William of Sicily and Hadrian were openly hostile to each

other; Frederick Barbarossa merely professed friendship; the barons of Campania raided and robbed each other and also robbed pilgrims on their way to Rome; and the populace of Rome, under the leadership of Arnold of Brescia, was in open revolt against Hadrian. Hadrian, after determining his situation in Rome, placed the city under interdict and retired to Viterbo. The Roman populace, unable to observe any sacred services until after Lent, eventually made its submission to Hadrian and banished Arnold of Brescia, who was ultimately executed. As Hadrian returned to Rome, Frederick Barbarossa was advancing through Lombardy. Frederick, having received the Iron Crown in Pavia, was intent on receiving the imperial crown in Rome from the hands of Hadrian. A famous meeting between the two rulers, temporal and spiritual, took place north of Rome at Sutri on 9 June 1155. Frederick, omitting a part of the customary ceremony of homage, did not hold Hadrian's stirrup when the pope dismounted. Because of this insolence, Hadrian withheld his kiss of peace and refused to crown Frederick until full homage was performed. Frederick submitted, performing the necessary act of homage on 11 June 1155 at Nepi; he was subsequently crowned in Saint Peter's on 18 June. Immediately afterward, fighting broke out between the imperial army and the Roman army; during this fighting, more than 1,000 Romans were killed. Without so much as an acknowledgment of the deaths, Frederick left Rome and went northward; on his way, he proceeded to burn the city of Spoleto to the ground.

William I of Sicily and Hadrian IV never established cordial relations. Hadrian called William lord rather than king; William took offense, ravaging and ransacking southern Campania, whereupon Hadrian excommunicated him, John of Salisbury spent three months with Hadrian in Benevento during this period and obtained from him the famous Donation of Ireland. The authenticity of the *Laudabiliter*, the document containing this grant, is in doubt; but in any case the basic assumption that the pope was overlord of Ireland and could therefore grant the entire island itself to whomever he pleased—in this case King Henry II of England—was an interesting legal labyrinth. For more than four centuries the popes maintained their right as overlords of Ireland.

By 1154, William I had captured important Italian cities and had

even confiscated 5,000 pounds of gold meant for the pope from his ally Manuel I. Eventually, Hadrian IV sued for peace. Under the peace agreement, William was invested with the territories of Naples, Amalfi, Salerno, and the March of Ancona; for his part, he pledged to be the pope's liegeman and pay a yearly tribute. Soon after this, Hadrian made peace with the Romans and returned to Rome. However, continued tension between the emperor, William I, and the papacy challenged Hadrian until his death on 1 September 1159.

Hadrian V, Pope

Hadrian V (Ottobono Fieschi, c. 1205-1276, r. 11 July-18 August 1276) was pope for only five weeks. Following the death of Innocent V in 1276, the cardinals met at the Lateran under the eye of Charles of Anjou and elected Ottobono Fieschi, a nephew of Innocent IV, to the papacy. Fieschi had been a successful legate to England during the minority of Henry III (1265-1268), promulgating influential legatine statutes. Thereafter he promoted Angevin interests in the curia. Perhaps because of the rigors of the conclave, the new pope proposed a revision of the rules for electing a pope—his only official act during his brief tenure. Hadrian V fell ill in August 1276 and died at Viterbo both unconsecrated and uncrowned. In Canto 19 of *Purgatorio*, Dante reserves a place for Hadrian among the penitent who are purifying

themselves of the sin of avarice.

Hagiography

Hagiography is the branch of learning that studies saints; sainthood; and the lives, miracles, and veneration of saints throughout history. This discipline developed from the particular nature of the documents, narratives, and accounts of saints' lives created during the course of the Middle Ages. The acts of martyrs (*acta martyrum*) and biographies of saintly men and women form a genre of devotional literature intended to be instructive and edifying while paying homage to the life and works of one or more saints or saintly persons awaiting official canonization.

Hagiographic texts may be literary, liturgical, or historical. The liturgical calendar celebrates a different saint each day. In the Middle Ages, monks began the practice of reading aloud the lives of saints on their feast days during communal meals in the refectories. Some of the hagiographic texts were too long to fit into the time allotted for a monastic meal and had to be abridged. This was the origin of texts such as the *Golden Legend* (*Legenda aurea*) by Jacobus da Voragine. Although these writings are varied and diversified, they all share certain basic characteristics and constitute a single genre. Although hagiographies are unreliable in terms of factual accuracy and historical veracity, they provide unique and valuable information about medieval traditions and customs. In order to prove sanctity, hagiographic texts often detail identical patterns and analogous occurrences in the lives of saints who lived far apart chronologically and geographically.

Sometimes the texts appear to follow a single guideline or model, to which they accommodate specific facts about the lives of individual saints.

Hagiography is fundamental in the study of the Middle Ages because of the importance given to the veneration of saints and everything connected with saints, such as icons and relics, during this era. Many hagiographies are anonymous; others are attributable; still others were written by great church figures, such as popes. Some hagiographies concern individual saints; some concern a group of saints; and some concern an entire class of saints—gathered, for example, according to geographic provenance, such as Eusebius of Caesarea's history of the martyrs of Palestine, Theodoret of Cyr's history of the monks of Syria, and Gregory the Great's history of the Italian fathers.

Hawkwood, Sir John

Sir John Hawkwood (Sir John de Hawkwood, Giovanni Acuto; c. 1320-1394) was born in Sibie Hedingham, Essex, the second son of a landowner and tanner named Gilbert Hawkwood, and died in Florence. John Hawkwood, a soldier and leader of mercenary troops, started his military career in France at the beginning of the Hundred Years' War and then became chief of mercenary bands for more than thirty years in Italy, where he was known as Giovanni Acuto.

John Hawkwood served in the army of Edward III, in France, and is said to have fought in the famous battles of Crècy (1346) and Poitiers (1356), gaining a knighthood. After the peace of Bretigny (1360), a great number of the troops were dismissed and many soldiers formed companies of free lances. Hawkwood became the chief of one such band. In 1362, he crossed the Alps and went south, into the service of the republic of Pisa, which was then at war with Florence. In 1364, he was elected captain general of a company of Englishmen called the White Company because of their shining arms and their splendid armor. With other mercenaries at the service of Pisa, Hawkwood attacked Florence and came near enough to the city to burn some suburbs. But the gold of Florence produced its effect, and all the other mercenaries, as well as a number of soldiers of the White Company itself, deserted him. He retired to Pisa with only 800 men.

In 1368, Hawkwood went north to Milan, where he was hired by Barnabò Visconti to fight against the pope and Florence. Hawkwood was sent again to central Italy to support Perugia in its revolt against the pope; there, he was surprised near Arezzo by German mercenaries who had been hired by the pope, was defeated, and was taken prisoner. However, he was ransomed by the Visconti, and he enjoyed such fame and prestige that he was able, in a short time, to put together another

company, consisting of his formerly scattered forces and hundreds of other mercenaries willing to serve under him. His army was so strong that it menaced the pope in Montefiascone and in Viterbo. Then, at Cascina, Hawkwood intercepted and defeated a force of Florentines with more than 4,000 men. Back in northern Italy, he defeated the forces of the marquis of Montferrat at Rubiera, in 1372, and laid siege to Asti. But he then left the service of Barnabò Visconti when Barnabò decided to reduce his pay.

Paolo Uccello (1397-1475), *Condottiere John Hawkwood* (1320-1394). Equestrian portrait. Duomo, Florence. Photo: © Erich Lessing/Art Resource, N.Y.

Within a few weeks, Hawkwood entered the service of the most determined of the current enemies of the Visconti, Pope Gregorius XI, who also had other leaders of mercenary troops at his service. One of

the other leaders, the French mercenary de Coucy, used a strategy that was based on attacking enemies at any cost, whereas Hawkwood thought that intimidation and threats could be more efficient and immensely less costly than open attack. For this reason, Hawkwood's contemporaries called him *cautissimus*. De Coucy caused Hawkwood to suffer an unmerited defeat at Montechiaro; but a few days after this, Hawkwood was able to turn on the pursuing Milanese and rout them.

In 1375, Hawkwood had to move against the free cities of Tuscany as commander of the papal army, which was strong enough to devastate the country but not to conquer the city-states of the region. When the Florentines offered a large sum of money in exchange for a solemn promise not to damage Florence and the other allied cities, Hawkwood persuaded the papal representative to accept the offer.

The pope was a bad paymaster and habitually answered Hawkwood's requests with vague promises and apostolic blessings. However, as payment for his services Hawkwood obtained the papal territories of Bagnacavallo, Cotignola, and Conselice in Romagna in 1376. In Italy, most of the cities in the papal territories were in rebellion against tyrannical exploitation by the papal legates, and Hawkwood was often asked to fight not against other armies but against the rebels—and to slaughter civilians, as he did in Cesena early in 1377. Chronicles report that 4,000 people were killed at Cesena. To avoid being used for the punishment of innocent people, Hawkwood decided to abandon the service of the pope in 1377 and joined the antipapal league, where he found his earlier enemies Barnabo Visconti and the Florentines.

Hawkwood, who was apparently a widower, married an illegitimate daughter of Barnabò, Donnina, in 1377. He moved to Romagna in order to establish himself in his possessions there, but soon the small dimensions of his land and the unfriendliness of his neighbors led him to change his mind. He decided instead to accept an offer from the republic of Florence, thus beginning a period of almost permanent service to the Florentine *signoria*. During the following fifteen years he fought against the pope and then against Gian Galeazzo Visconti, Barnabò's nephew, who had risen to power in Milan after ousting Barnabò. Hawkwood guided an army against Gian Galeazzo Visconti in northern Italy, with some success, and was able to retreat without losses when a disagreement with the allied forces made the course of

the campaign unfavorable. Contemporary sources regarded this retreat as a victory. When Hawkwood went again to northern Italy to fight against Verona, which was allied with the Visconti, he achieved a significant victory over the Milanese and Veronese forces at Castagnaro on 11 March 1387. In 1391, he bravely and efficaciously defended Florentine positions in Tuscany against the army of the Visconti, which eventually retreated.

Hawkwood received honors and consideration from the Florentine *signoria* and had a palace near Florence. He lived at this palace until his death, which occurred during the night of 16–17 March 1394. Solemn funerals were provided by the *signoria*, and his widow received a life pension. In 1430, the republic commissioned the famous artist Paolo Uccello to paint an equestrian portrait of John Hawkwood in the cathedral of Florence. The large fresco is still there, as well as the inscription, which begins: *Ioannis Acutus Eques Britannicus, Dux Aetatis suae Cautissimus et Ret Militaris Peritissimus*.

John Hawkwood was a typical *condottiere* and one of the best-known leaders of mercenary troops of his time. He served the most important and mightiest states of Italy—Florence, Milan, and the pope. His military ability was universally recognized. He is said to have introduced into Italy a strategy of the English army that involved dismounted knights wielding long lances and mobile archery squads with longbows. As a *condottiere* employed by different states, he could rarely develop autonomous strategies, but whenever possible he avoided the risk of fighting for targets that could be obtained by other means.

Henoticon

The dyophysite doctrine—belief in the two natures of Christ— was promulgated as orthodox dogma at the Fourth Ecumenical Council of Chalcedon in 451; however, it was deemed unacceptable by large numbers of Monophysite Christians, especially in Syria-Palestine and Egypt. The Monophysites' resistance to this dogma created not only a theological problem but also regional and factional political dissension.

The eastern emperor, Zeno (474-491), whose stormy reign had been complicated by this problem, attempted to resolve it, on the advice of his patriarch of Constantinople, Acacius (r. 472–489), by issuing the *Henoticon*, or Decree of Unity, on 28 July 482. The *Henoticon* was addressed specifically to Egyptian church circles. Without officially condemning the Chalcedonian doctrine, Zeno effectively bypassed it, reaffirming a doctrinally neutral stance based only on the earlier decrees of the Council of Nicaea.

While this vague, flexible approach was astute and was welcomed by moderates, it did not satisfy the hard-core extremists on either side, and the Monophysite dissent continued. Meanwhile, the adamant Chalcedonians secured the support of the new pope, Felix of Rome (r. 483-492), who condemned Zeno's decree (July 484) and

excommunicated Acacius. This act initiated the so-called Acacian schism, which had as much to do with questions of jurisdiction as with questions of doctrine and constituted the first such breach between the churches of Rome and Constantinople. Such opposition was ignored by Constantinople, however, and the *Henoticon* remained official imperial policy until 518, when Emperor Justin I abrogated it and ended the Acacian schism.

Henry II, Saint and Emperor

Henry II (973-1024, r. 1002-1024) was the last of the Saxon line of

German emperors, succeeding to the throne after the death of Otto III. Henry had been destined in his early years for a career in the church and had therefore received an outstanding education; he had also developed sympathy for the church reform movement. He was very pious and believed that he was the head of Christendom.

Henry, who was much more concerned with Germany than with Italy, journeyed to Italy only three times during his reign. The first journey was undertaken in response to Arduin of Ivrea, who had proclaimed himself king of Italy. Arduin was forced into the Alps, although he did not renounce his claim until 1015; and Henry was crowned at Pavia as king of Italy. The next expedition to Italy was in 1013-1014 at the request of Pope Benedict VIII, whom Henry had to rescue from fighting among Roman families. It was at this point, in 1014, that Henry was officially crowned in Rome as Holy Roman emperor. Henry's final journey to Italy, once again at the pope's request, took place in 1021-1022, when Henry pushed back the Byzantines in southern Italy and reattached Capua and Spoleto to the Holy Roman empire.

Pope Eugenius III canonized Henry in 1146.

Henry IV, Emperor

Henry IV (11 November 1050-7 August 1106) was born (possibly at Goslar) the son of Emperor Henry III and Agnes of Poitou; was elected king at Tribur in November 1053; and was crowned on 17 July 1054 at Aachen. He nominally began his reign in 1056, after the early death of his father. His guardianship was in the hands of Empress Agnes until April 1062, when conspirators led by Archbishop Anno II of Cologne abducted the young king. Anno also changed imperial ecclesiastical policy, dropping imperial support of Bishop Cadalus of Parma, who had been elected by Italian opponents of the reform movement in Rome as antipope Honorius II. In collaboration with Peter Damian, the German court recognized Pope Alexander II (r. 1061-1073). Henry began to govern in his own name in March 1065. In July 1066, he married Bertha of Turin; he tried to divorce her in June 1069 but desisted in the face of remonstrations by Peter Damian,

Henry's relationship with the German nobles was tense from the beginning of his reign, and the tension increased c. 1067, when Henry resumed his father's policy of establishing a firm hold on Saxony by strengthening and expanding royal rights and properties. Fortifications were occupied by predominantly southern German ministerial functionaries. The Saxons were provoked to resist, playing into the hands of Otto of Northeim, who had been duke of Bavaria since 1061. The summer of 1073 brought an armed revolt, but Henry's victory in the battle of Homburg in September 1075 was decisive enough to achieve the election of his son Conrad by the nobles at Christmastime 1075.

The defeat of the Pataria faction in Milan in the spring of 1075 and his own victory over the Saxons encouraged Henry to believe that he could solve the investiture problem, which had arisen in Milan as well. However, his nomination of Tedald to the archbishopric of Milan

provoked the fierce opposition of Pope Gregory VII, who expressed his opposition in writing in a letter of 8 December 1075 and also in an oral statement, of unknown content, delivered by the messengers. The reply came from the Diet of Worms (24 January 1076). The German episcopate, which resented the pope's hierocratic claims (i.e., claims having to do with government by ecclesiastics) and the centralization of the papacy, renounced their obedience to Gregory, claiming that his election had been illegal. Henry IV, in a separate letter, asked Gregory to resign. The northern Italian bishops immediately supported these measures. Gregory responded from a Lenten synod that he was holding in Rome (14-20 February 1076). In a prayer to the apostle Peter, the pope, relying on his power to loose and to bind as Peter's successor, deposed and excommunicated Henry and absolved Henry's subjects from their oath of obedience to the king. In response, many of the bishops deserted Henry, joining forces with the Bavarian and Saxon opposition. By October 1076, at a meeting of princes in Tribur, the king had to accept the terms of the opposition and declare his submission to the pope. Moreover, unless Henry was absolved from his excommunication by February 1077, the princes would proceed to elect a new king. Last but not least, the princes invited Gregory to Germany as an arbitrator to a diet that would be held at Augsburg in February 1077. Since Gregory refused to receive Henry in Rome, Henry decided in mid-December 1076 to meet the pope on Italian soil. Henry, with his wife Bertha and his two-year-old son Conrad, set out via Burgundy and Turin, crossing Mount Cenis because other Alpine passes were in the hands of his German opponents. Gregory withdrew to the fortress of Canossa (which belonged to Countess Matilda of Tuscany) when he learned of the king's arrival. Thanks to the mediation of Henry's godfather, Abbot Hugh of Cluny, and of countesses Matilda and Adelheid of Turin (the latter was Bertha's mother), Gregory finally reconciled Henry with the church on 28 January 1077 in a pastoral act. Henry had appeared in the inner courtyard of the castle for three days in a row, barefoot and dressed in a penitent's hairshirt, requesting permission to enter. Gregory, in his correspondence with the German princes, tried to leave the question of the kingship open, but after the events of Canossa he, in fact, again recognized Henry as king. This recognition lasted until the Lenten synod of 1080, when Henry was

excommunicated a second time. Simultaneously, Gregory recognized Rudolf of Rheinfelden, duke of Swabia, as the German king. Rudolf had been elected by the German princes on 15 March 1077, Henry's absolution of 18 February 1077 notwithstanding. At the synod of Brixen (June 1080) Archbishop Wibert of Ravenna was nominated by Henry and the princes as the successor of Gregory VII, whom the synod deposed. The death of Rudolf, and military as well as political successes, enabled Wibert and Henry to enter Rome in March 1084. Wibert was formally elected to the papacy and enthroned as Clement III. On Easter Sunday 1077, Clement III gave Henry and Bertha the imperial crown. Gregory had fled into Castel Sant'Angelo. His vassals, the Normans (under Nicholas II), came to his aid, forcing Henry and Clement to leave the city temporarily. But Gregory was also obliged to leave the city; he found refuge with the Normans at Salerno, where he died in 1085.

Henry, after his return to Germany, was at first able to consolidate his position. Henry V was elected as his successor and was crowned on 6 January 1099 at Aachen. With the death of Clement III in 1100, the end of schism in the church seemed possible. However, all the negotiations between Henry IV and Pope Paschal II (1099-1118) ended in failure, since Henry refused to give up investiture of bishops with ring and staff—the one demand on which Paschal insisted. The collapse of these negotiations with the papacy lay behind the rebellion of Henry V against his father. Hoping to obtain concessions from the pope and thus bring about peace between the church and the empire, Henry V rose against his father in late 1104; he captured Henry IV through a ruse in late 1105. At Ingelheim on 31 December 1105, Henry IV was forced to abdicate. He managed to flee and attempted to regain power; but he died at Liege on 7 August 1106. Eventually, Henry IV was buried in the cathedral of Speyer.

Henry V, Emperor

Henry V (11 August 1086-23 May 1125, r. 1106-1125) was the son of Emperor Henry IV and Bertha of Turin; he married Matilda, daughter of King Henry I of England in January 1114.

Henry V was elected king at the Diet of Mainz in 1098, at age twelve, in place of his elder brother Conrad. Conrad had been crowned at Aachen in 1087 as successor to the throne but had joined forces with Matilda of Tuscany and Pope Urban II (r. 1088–1099), who recognized him in 1095 in the mistaken belief that Conrad could count on support in both Germany and Italy. At a meeting in Cremona, Conrad had acted as honorary squire to the pope, holding the pope's stirrup, leading the pope's horse by the bridle, and swearing the customary oath of security. Henry IV had learned a lesson from this. His son Henry had to swear an oath never to act against his father's interests so long as his father was alive. When Henry V nevertheless rebelled against his father, he secured a dispensation from that oath from Pope Paschal II (r.

1099-1118). Paschal was anxious to settle the investiture question for the empire, as he was to settle it successfully for France (1107) and England (1105), and did not hesitate in recognizing Henry V, who appeared to be a champion of the church in Germany and was allied with Henry IV's princely opponents.

However, when Henry IV died (on 7 August 1106), Henry V resumed his father's policies both in Saxony and with regard to the investiture question and the papacy. In negotiations at Sutri during the winter of 1111, Henry V obtained Paschal's recognition of royal claims to the "regalia," i.e., secular rights and properties, even when these had been granted as gifts to the church. Using semantic manipulations, Henry V could promise solemnly to renounce investiture with ring and staff if Paschal would require German ecclesiastics to return their regalia to the empire. Both agreements were embodied in charters to be read at the imperial coronation ceremony in April 1111 in Saint Peter's. Henry's purposeful use of propaganda—the first by a medieval ruler—has muddied the waters for historians; but in any event an uproar in the entourages of both king and pope during the ceremony prevented the public reading of either document. Paschal, who considered that Henry had failed to fulfill the agreement, refused to crown him and was then captured, along with his clergy, including many cardinals. To prevent the election of an antipope, Paschal eventually gave in, crowning Henry and allowing him to continue to invest bishops and abbots with ring and staff. This privilege was withdrawn in 1112. Henry's negotiations over this question with Pope Calixtus II in 1119 failed once again; but under pressure from the German princes and the church, Henry finally agreed to the compromise of Worms (later the concordat) of 1122. Under this agreement Henry would be satisfied with the right to use the scepter in investing canonically elected clergy with the temporal possessions of their sees; he would abandon the use of the ring and staff, which had become symbols of spiritual office. Henry thus implicitly abandoned claims to a theocratic kingship, accepting his position as layman with regard to the church.

Henry V died childless. His death ended the Salian (or Franconian) dynasty, but his efforts to maintain the rights of the crown were responsible for a renewal of the empire under the Hohenstaufen. He is buried with his ancestors in the cathedral at Speyer.

Henry VI Hohenstaufen

Henry VI (1165-28 September 1197) was born at Nijmegen in the Netherlands and died at Messina. His father was Emperor Frederick I Barbarossa and his mother Beatrix of Burgundy. Henry was elected king of Germany at Bamberg in June 1169 and was crowned at Aachen on 15 August 1169. He was invested with his German lands in 1179.

Henry played a key supporting role in Frederick's efforts to recover his authority in Italy after the peace of Venice (1177), which sealed his failure to assert imperial control over the cities of northern Italy. Pope Alexander III (r. 1159—1181) remained wary of imperial intentions in Italy even after making peace with the emperor. Alexander's successor, Lucius III (r. 1181 — 1185), shared this skepticism and refused Frederick's request to crown Henry coemperor. Frederick subsequently arranged with William II Hauteville, the king of Norman Sicily, for the marriage of Henry and Constance, who was William's aunt and the daughter of Roger II. Henry and Constance were betrothed in 1184 and were married at Milan on 27 January 1186. Henry was crowned king of

Italy and remained there to oversee the ever-shifting relationship between the empire and the Lombard cities. Henry ruled the entire empire after Frederick Barbarossa departed on a crusade in 1189; he became emperor when Frederick died en route to the Holy Land in 1190.

Henry inherited not only the empire but also an imperial agenda. The Hohenstaufen cultivated an ideology of world empire grounded in Roman law and worked to strengthen the monarchy in a Germany dominated by princes. They attempted to increase imperial power in Italy. They led the effort to secure the Holy Land. This ambitious program aroused a great deal of enmity; indeed, the ambitions of the Hohenstaufen clashed with those of the papacy in almost every particular. Henry brought a cold, ruthless intelligence to his struggles with popes, German princes, Lombard cities, and Norman barons; but his impatience and brutality often marred his otherwise adroit handling of the many crises that he encountered during his short reign.

Henry faced two problems immediately. William II died childless in 1189. The Norman barons feared German domination and attempted to prevent Henry from claiming Sicily by right of his wife, Constance. They elected as king Tancred of Lecce, the illegitimate grandson of Roger II. Before Henry could turn his attention to Sicily, trouble erupted in Germany. In 1190, the deposed Welf duke of Saxony, Henry the Lion, returned from exile in England to resume his struggle with the Hohenstaufen. Henry quickly suppressed that revolt and returned to Italy. Pope Celestine III (r. 1191-1198) reluctantly crowned Henry emperor on 15 April 1191, as a reward for making peace between the Roman barons and the papacy. However, the fear of imperial encirclement of the papal patrimony in central Italy induced Celestine to favor Tancred against the emperor. Henry laid siege to Naples, but disease forced him to lift the siege. By the end of 1191 he was back in Germany and facing a coalition of the Welfs and their allies.

In 1192, Henry was implicated in the murder of Albert of Brabant, an anti-imperialist whom Celestine III had confirmed as bishop of Liège. This murder further widened the breach that had opened between the pope and the emperor over the pope's support for Tancred and the emperor's acquisition of the Matildine lands in Tuscany and Umbria. Early in 1193, Duke Leopold V of Austria captured King Richard I of

England, who was returning from the Holy Land, and handed him over to the emperor. The imprisonment of the crusader king provoked widespread outrage in western Europe, but Henry turned it to advantage. Richard eventually paid the merciless emperor a ransom of 150,000 pounds and acknowledged him as overlord. The Welfs were then reconciled with Henry. Both Richard and the Welfs abandoned Tancred. These events estranged the French monarchy from Henry, and the influence of the papacy in the Netherlands increased after the murder of Albert; but soon after Richard's release in February 1194, Henry was again free to pursue his claim to the kingdom of Sicily.

Tancred died on 20 February 1194. He was succeeded by his young son, William III, but the boy king could not organize opposition to Henry. William was captured, blinded, and sent to Germany. All resistance collapsed. Henry was crowned king of Sicily at Palermo on 25 December 1194. The next day, the future Frederick II was born to Constance at Jesi. The prosperous and well-governed kingdom of Sicily financed Henry's expanding political ambitions. Henry clamped down on the Norman barons and installed loyal German followers throughout the kingdom. He applied economic pressure on the Barbary ports of North Africa. He bestowed crowns on the kings of Cyprus and Lesser Armenia. He arranged a marriage between his brother, Philip of Swabia, and Irene, the daughter of the late Byzantine emperor, Isaac II Angelus. He forced Isaac's successor, Alexius III, to pay tribute for lands that William II once held in the Balkans. He pressed the kings of France and Aragon to acknowledge his overlordship as Richard had done. Henry took the cross at Easter 1195 and began to prepare a major crusade to the Holy Land. By the end of 1195, Henry was well on his way to establishing the hegemony of the Hohenstaufen in the Mediterranean.

The crusade improved relations between Henry and Celestine III, despite the pope's discomfort over imperial control of the kingdom of Sicily, the Matildine lands, and the Adriatic portion of the patrimony. Henry felt secure enough in Italy to return to Germany. Henry the Lion died in August 1195; this was, therefore, a good time for Henry to pursue increased imperial authority in Germany. In 1196, Henry called a diet at Würzburg, at which he attempted to persuade the princes to make the imperial title hereditary. In exchange, he offered the secular

princes unrestricted inheritance of fiefs in the male and female lines and offered the ecclesiastical princes a repeal of *ius spolii*, which allowed the emperor to seize the personal property of deceased prelates. Henry did not sway the princes, however. The pope, fearing that a hereditary empire in Hohenstaufen hands would threaten the independence of the papacy, refused to intervene on behalf of the emperor. The archbishop of Cologne, who feared that his customary right to crown the elected kings of Germany would become an empty formality, led a successful opposition. As a consolation prize, the princes elected the young Frederick king of Germany in December 1196.

Henry's humiliation at Erfurt worsened existing conflicts in Germany, Lombardy, the papal states, and the kingdom of Sicily. Henry returned to Italy in 1197, disappointed and angry. He ruled the kingdom of Sicily with an iron hand. He enforced royal prerogatives pitilessly and revoked many of the privileges that Tancred had granted to the Norman barons. A plot against Henry's life escalated into a full-scale insurrection. Longstanding resentment among the Muslims in western Sicily exploded. Henry suppressed the barons' revolt quickly, effectively, and savagely; but the Muslims' revolt flared off and on until Frederick II finally extinguished it in the 1220s. Some German sources have implicated Constance in the plot against Henry, but they continued to live together and rule the kingdom jointly.

By mid-1197, Henry felt confident enough to concentrate on the crusade. He saw it as a chance to display his devotion to the faith, demonstrate his military prowess, and thus win support among prelates and princes. Henry sent a small force forward to the Holy Land in late summer, but he himself died of a fever, perhaps malaria, at Messina on 28 September 1197. The expedition that Henry had planned fizzled when he died. Constance ruled the kingdom of Sicily after his death, but she, too, died in 1198. Her four-year-old son, Frederick, succeeded her.

For a decade, turbulence gripped the kingdom of Sicily. Constance had relinquished Sicily to the papacy as a fief, but Pope Innocent III (r. 1198-1216), the guardian of young Frederick, put more effort into solidifying papal lordship than into protecting the interests of his ward. Innocent exploited the disputed imperial succession in Germany to enhance papal claims of universal lordship. He consolidated the

patrimony into a coherent state to impede future imperial threats to the popes' freedom of action in central Italy. He claimed papal leadership of the crusade at the Fourth Lateran Council in 1215.

Henry's political program disintegrated at his premature death. His claims to a universal empire lapsed; Sicily and much of the rest of Italy were riven with strife; a disputed succession plunged Germany into civil war; and the papacy seized control of the crusading movement. Henry left as a legacy to his son a fierce commitment to imperial greatness, royal power, and the crusade; but enduring hostility and suspicion were also part of that legacy. The deep hatred that Henry VI aroused among his many enemies passed all but intact to Frederick II.

Henry VII of Luxembourg

Henry of Luxembourg (c. 1275-1313) was the son and heir of Count Henry III of Luxembourg (d. 1288). Young Henry was raised at the French court and spoke French as his native tongue. In 1292, he married Margaret, daughter of the duke of Brabant. As count, Henry he was noted for his effective rule, especially as peacekeeper in local feudal disputes. After Albert, king of the Romans, was assassinated on 1 May 1308, Henry was elected unanimously in Frankfurt on 27 November 1308. He was crowned on 6 January 1309 in Aachen.

Within weeks of his coronation Henry began preparations for his *Romzug*, the journey to Rome for coronation as emperor. Although several of his predecessors had avoided it, Henry felt a need to gain the prestige that the Germans associated with the imperial title, given his own dynastic obscurity and the concessions he had made to be elected. He also wanted to reassert the imperial presence in Italy, which, although practically semiautonomous, was legally subject to the emperor.

In July 1309, Henry assured Pope Clement V, who was resident in Avignon, that he would observe and defend the rights and privileges of the cities of the papal states and would embark, as emperor, on a crusade. In return, the pope formally supported Henry's journey. During the spring of 1310, royal emissaries traveled through Lombardy and Tuscany to prepare the cities for Henry's arrival. In early

November 1310, Henry arrived in Turin accompanied by some 5,000 men, including 500 cavalry. Henry would never cross the Alps again.

Northern Italy was fragmented into nearly independent city-states that often suffered from deep social and political divisions. Guelfs and Ghibellines fought openly in cities, often making bitter, potent exiles of the losers. Urban nobles had long clashed with the non-noble classes over interests and political power bases, and in many cities strong leaders emerged as one-man rulers, or *signori*. For decades, cities had created and followed their own laws and policies, controlled their

hinterlands, and maintained delicate intercity relations by custom and compromise without reference to imperial interests. Although Henry had been a successful politician and lord north of the Alps, his ignorance of Italian institutions, politics, and recent history would prove fatal to him in Italy. With the best intentions—he wanted to be an impartial conciliator and peacemaker—he would upset these complicated relationships by consciously supporting Ghibellines and nobles, deposing old *signori* and imposing new ones, pressing imperial claims to what had become communal lands and rights, and replacing communal statutes with imperial laws.

As early as March 1310, Tuscan cities led by Florence and Bologna created a Guelf defensive league, nominally under the patronage of the pope and the Angevin King Robert of Naples. The league wanted guarantees against imperial interference in communal affairs; in return, the league would support Henry with cash and troops. Early in his campaign, Henry confirmed the Guelfs' fears. Between 11 November and 11 December he radically interfered in the affairs of the town of Asti—reorganizing political offices, releasing officials, and retrying criminals. As Henry marched toward Milan, the Guelf *signore* Guido della Torre refused to give up his palace or his personal mercenary guard. Guido's defiance remained peaceful, however, and on 23 December Henry entered Milan. He soon replaced Guido with the Ghibelline Matteo Visconti. On 6 January 1311, Henry was crowned king of the Lombards; the dismayed Tuscan Guelfs avoided attending the ceremony. The Milanese offered Henry a "gift" of 100,000 florins; and Henry, taking 100 young noblemen as a bodyguard (and hostages), left Milan on 14 February.

On 10 January, Henry had made his brother-in-law, Amadeus of Savoy, vicar-general of Lombardy, to act as fiscal, judicial, and military agent of the king. This arrangement would cost the cities some 300,000 florins per year. By February, Guelf forces reacted. On 12 February, the della Torre faction revolted in Milan and were put down with moderation. Later in the month Brescia, Crema, Cremona, and Reggio expelled both their Ghibellines and their imperial vicars. Again, Henry responded moderately, but the rebels resisted and holed up in Cremona. Many of them submitted to Henry on 26 April, but he took revenge by destroying the city gates and walls and the rebels' houses, imposing

fines, and withdrawing civic rights and privileges. Resistance stiffened, and by 19 May Henry's army was besieging Brescia. Despite plague and desertion, it remained in place for four months and broke the resistance. Harsh reprisals, but no death penalties, followed.

Henry moved on to Genoa, arriving on 21 October. Town leaders and the king carried out long negotiations over regalian rights in the countryside, most of which Henry retained or regained. Between October 1311 and mid-February 1312, when Henry left for Pisa, Guelfs in Lodi, Reggio, Cremona, Piacenza, Parma, Pavia, Padua, and Brescia rebelled against their imperial governments. Since Florence was the key supporter of the revolts, Henry declared all Florentines rebels and released their debtors of their debts. Revolts in Brescia, Lodi, and Piacenza were quelled, but in April both Asti and Treviso rebelled. Pisa welcomed Henry on 6 March, and while he waited for reinforcements he wisely refrained from interfering in Pisan affairs.

By 7 May, Henry's force was outside Rome, now controlled by Angevin Guelfs from Naples. Henry's long-delayed coronation was delayed further by military resistance in Rome. Despite a major victory on 26 May, Henry could not capture Saint Peter's, so the pope's reluctant representatives crowned Henry in Saint John Lateran (29 June 1312). The new emperor now turned against Tuscany to punish Florence. In mid-September Henry's siege began, with 15,000 men and 2,000 cavalry against the Florentines' 60,000 men and 4,000 knights. The operation was unsuccessful, though it lasted six weeks.

On 10 March 1313, Henry reentered faithful Pisa. His patience long since exhausted, the emperor condemned all inhabitants of rebellious cities to be captured, stripped, and hanged. Papal interests were also threatened as Henry condemned Bologna, for example, and declared the papal vassal Robert of Naples guilty of lese-majeste for having opposed the coronation and having interfered in Rome. Publicists revived papal and imperial claims to universal authority, and a lively scholarly debate—which involved Dante (in *Monarchia*)—ensued. Henry also prepared to invade Naples, and on 8 August 1313 he left: Pisa for Siena and points south. He died of malaria while besieging Guelf Siena on 24 August, and was buried in the baptistery of Pisa.

Heraldry

Heraldry—an interdisciplinary historical science whose objects are coats of arms—goes back to the beginning of the twelfth century in France. At that time, heralds, in the service of noblemen, especially in tournaments or in wars, could recognize knights from their coats of arms and praise the ones who distinguished themselves. (Old French *biraut* is a loanword from Old High German *hariowalt* "foreman of the army.") In the fourteenth century heralds were also in the service of the Italian communes. Their responsibility was often identical to that of trumpeters and town criers. Heralds were active in diplomatic service and as masters of ceremonies, and they occasionally composed political verses for the lords, as did the head of the office of heralds of the Florentine *signoria*, which came into existence in 1350. All heralds were representative, symbolic figures; they constituted a community in which reality melded with the ideal—whether courtly chivalry or "good" government. In their records we find descriptions of coats of arms; these follow definite rules and can be included in a broad definition of heraldry along with the activity of the heralds. Moreover, a broader concept of heraldry includes not only the coats of arms in their historical context but also the art of coats of arms. Besides the established specialized heraldic literature of the fourteenth century (letters on coats of arms, rolls of coats of arms, and treatises), the sources for the medieval Italian system of heraldry consist of allusions in written sources; preserved blazons and flags; and symbolic

representations on seals and coins and in architecture, art, and handicrafts.

The object of these descriptions is the full coat of arms, which consists of the blazon and the helmet with the helmet cover and crest. Other distinguishing characteristics include the holder of the shield, and pictorial and written devices. The meaning of the full coat of arms depends on the arrangement of elements according to a system of rules; another determining factor is its ability to be passed on from generation to generation. The shape of the shields reproduced in the sources conforms to those actually used, while emphasizing characteristic features. This was especially true of Italian heraldry. Together with the "classic" three-cornered shield of the thirteenth century, Italians in the fourteenth century also preferred a rounded almond-shaped shield and the *targe* that on the upper right side had a place for the spear. Coats of arms were described from the perspective of the man who puts on the shield (i.e., left and right are seen from his point of view). The colorful nature of a coat of arms is determined by various dyes: from metallic tones—gold (*or*) and silver (*argent*)—and red (*gules*), blue (*azur*), black (*sable*), green (*vert*, later also *simple*) and purple (*puorpre*). To aid the recognition of coats of arms, it was determined that no metallic tone should be close to another, and the same was true for individual colors. Moreover, fur was used in decorative combination with one metallic tone and one color: e.g., the silver-black ermine and the silver-blue vair.

In medieval Italian heraldry, popular decorative schemes included wave and cloud forms. Colors were used to organize and subdivide a coat of arms, either through divisions on the shield's surface or through use of various stylized heraldic elements such as chevrons or lances, or common figures such as a lion, star, or lily. Symbolic coats of arms were preferred by families (Malaspina: thorn bush; Colonna: column; Delia Scala: ladder) and cities (Aquilaia: eagle; Chiavenna: key; Rovereto: oak). The helmet cover generally repeated the colors of the shield, the crest those of the content of the shield. However, the crest often depicted another figure (e.g., the lion mask with the wings of the house of Savoy), which was passed on as was the blazon.

The system of coats of arms spread from the French-Anglo-Norman area to the rest of Europe c. mid-twelfth century as part of the knightly and courtly culture. Beginning in the thirteenth century, even non-

nobles had coats of arms. Above all, the spread of the use of seals, and the increased use of coats of arms on seals, made the system of seals a catalyst for the development of systems of coats of arms. The rules for these systems were governed by new social norms and the assignment of symbolic meanings to the elements found therein. Influenced by feudal and Roman laws, a legal system involving coats of arms developed. In the fourteenth century, this led to a practice whereby, since the time of Charles IV, emperors, popes, and some cities were given the right to grant or to make improvements on coats of arms for use in writing letters, as well as the right to reserve coats of arms for themselves and to name counts (*comites palatini Caesarei* or *papales*) who could also grant coats of arms. In this context, we find the famous treatise of Bartolo di Sassoferato (or Bartolus, c. 1314-1357), a judge from Perugia who formulated the principle that anyone may receive and bear a coat of arms, if he does not claim a particular title by means of this insignia and does not damage the reputation and property of others, either materially or symbolically. On this topic, Bartolo makes particular reference to the use of coats of arms as official stamps (*bollo*) and as trademarks (i.e., by notaries, craftsmen, and trading companies). We must also note that the bearing of coats of arms required a specific social status in order to be recognized.

In addition to the fact that individual soldiers could be identified by their coats of arms, these insignia functioned not only as a symbol of social status but also as a symbolic means of communication. Their symbolism derived primarily from the imagery of a secular military culture, which had already associated itself in an earlier time with ecclesiastical, animal, and color symbolism. In this way it is possible to see the broader connection between the characteristics of wild animals (which were popular from the very beginning as figures for shields) and the people who bore the coats of arms. This connection was later extended to include material present in the Bible and in bestiaries for spiritual and courtly allegories.

The invasions of Italy by German kings and the crusades brought many new heraldic influences to Italy. The noble coat of arms of the members of the house of Hohenstaufen (with the German eagle) played an important role as a symbol of sovereignty both in the kingdom of Italy and in the kingdom of Sicily. Two illuminated manuscripts

provide evidence of the use of heraldic material in Italy: one of the earliest pictorial testimonials, the book of Petrus of Eboli (c. 1195-1197), depicts Henry VI on a campaign in southern Italy; and the so-called Balduineum manuscript (1340) shows Henry VII's march to Rome, in which we see the flourishing late medieval use of coats of arms.

The pontificate of Boniface VIII marked a turn toward the uninterrupted use of coats of arms by the papacy. From 1300 on, the popes began to display family coats of arms, above which were placed the papal insignia such as Peter's keys, the shield (*conopeum*), and the tiara, whose importance as the papal crown was established in the first half of the fourteenth century. In addition to the personal coats of arms of the popes, a coat of arms for the church itself was established c. 1300—two crossed silver keys on a red field. This coat of arms went back to the emblems and representations on thirteenth-century banners and represented the church both in general terms and as a political power. To the noble representation of the pope belonged the creation of the "knights of the golden spurs" who bore Peter's keys as a symbol of their *militia aurata*.

In the second half of the twelfth century, the communes of northern Italy adopted their own coats of arms, which displayed their self-confidence. Preheraldic symbols of power, such as flags, preceded them and influenced their design. Retrospectively, at the end of the communal age almost all of the cities' *signa*— i.e., banners, bells, war chariots (*carroccio*), and seals—contained heraldic figures. The ideal of peace so fervently desired by the communes always found symbolic expression in their coats of arms. Many coats of arms featuring the cross resulted from this notion and developed under the influence of religious unification movements in the eleventh and twelfth century and of a society that waged war in the name of Christ. For this reason, the two colors of a civic coat of arms were interpreted as the unity of magnates and *popole* in a commune. In the second half of the fourteenth century, this idea found expression in the written motto *libertas* in additional coats of arms in Bologna and Siena, which were almost always gold on blue; and in Florence on the coat of arms of the *otto santi* ("eight saints"), which were silver on red. In the collective consciousness, coats of arms stood for the honor, unity, and continuity of the town. They legitimized power and political action and integrated

the various groups within the city. In civic rituals, the coat of arms was combined with other communal symbols. Furthermore, civic coats of arms were displayed as a sign of power at special public areas of the city (such as city gates and the gates of cities under its control, citadels, communal palaces, and churches). In addition to their coats of arms, many communes had symbolic animals, like the griffin of Genoa and the imperial eagle of Pisa, which also appear as figures on seals, as well as the Sienese she-wolf, the Florentine lion (*marzocco*), and the lion of Saint Mark of Venice. Beginning in the late fourteenth century, the latter two coats of arms were put into sculptural form by the republics as symbols of power in those cities over which they ruled. Towns in the areas controlled by these cities also displayed the coats of arms of the dominant communes as an indication of protection and dominion; these coats of arms were adorned with the figures and colors of their own insignia. The varied structure of society became visible through the many coats of arms displayed by different classes of people: the *popolo*, the guilds, the confraternities, the neighborhoods of the city (usually determined by the names of the city gates), political parties, communal officers, religious societies, canons (the chapter), and even the masons who constructed the cathedral: each group had its own coat of arms.

The dynamic quality of both communal and family coats of arms makes Italian heraldry special. While traditional and inherited family coats of arms expressed continuity and so remained virtually unchanged, communal coats of arms underwent changes in order to maintain their symbolic identity. When a changeover in power came from within the commune—and not from outside—a transformation in the coat of arms was very risky. The potential for change in heraldic standards made modifications in coats of arms necessary for their survival. A prominent example was the inversion of the colors on the Florentine coat of arms, which at one time presented a silver lily on a red field but was later altered, following the exile of the Ghibellines (see Dante, *Paradiso*, 16.151-154), to a red lily on a white field.

Members of both the magnate families and the *popolo* bore family coats of arms that often demonstrated their affiliation through the choice of a specific color or design. In addition, the cavalry who were responsible for their armament considered themselves part of the knighthood and bore a coat of arms. Family coats of arms inspired

artistic representation on objects and on family tombs in commemorative chapels in churches. Special attention must be given to the custom—especially popular in central Italy—according to which the ruler of a town, either the *podestà* or the curate, had a stone plaque with his coat of arms mounted on the communal palace in memory of his term in office. Here family and communal honors united and influenced each other. The leader thus established his noble status, which he needed to qualify for the office; and the coats of arms, which remained in constant view of the citizens, emphasized governmental continuity and honored the families for their civic service. Individuals announced their party affiliation—Ghibelline or Guelf—through shield heads on their family coats of arms, in which they inserted the crest of the ruling house or family, as, for example, the house of Anjou (see Dante, *Paradiso*, 6). In contrast to the honor associated with the bearing of coats of arms, we find much criticism of the arrogance that such practices engendered. However, this criticism was motivated by abuses and did not jeopardize the basic principles concerning the nature of coats of arms. Thus Bernardino of Siena attempted to stop the dispute between parties that made peace within the city impossible. He wanted his emblem—the monogram of Christ in the sun—to replace the coats of arms of those parties whose arrogance remained a constant source of trouble as long as their emblems were clearly visible.

With the advent of the *signorie*, the dynamics of the coats of arms borne by noble families invaded the civic symbolism of the commune. The old coats of arms of the town continued to exist but were replaced by those of the *signorie* on monuments, flags, seals, and coins in the public arena. The binding of these noble families into the dynastic and close-knit European aristocracy is also visible in their bearing of coats of arms. Dynastic and other legitimizing forces led to a reevaluation of coats of arms and to their increased importance relative to the coats of arms of aristocratic families, related either by marriage or by class, and the coats of arms purchased or claimed by rulers. In the same way, signorial heraldry was characterized by the use of devices (*imprese*) that consisted mostly of a combination of pictorial and written signs and could be ephemeral symbols of individual personality or could be inherited. With their motifs, in which courtly and religious symbolism and allegories of virtue were united, the *imprese* are, at the same time,

personal creations of Italian heraldry and witnesses to the international figurative language of courtly culture. Princely *imprese*, which could also be worn as symbols of affiliation and party, became symbols of courtly orders, e.g., the love knot and the motto *Fert* of Amadeus VI of Savoia for the Order of the Collar—the later order of Annunziati—established by him in 1364. The *imprese*, which were becoming more and more complicated, signaled the dissolution of Italian heraldry through the increasing infiltration of emblems in the early Renaissance, e.g., through archaizing of mythological figures—which were popular primarily in the numerous academies—or through the arrangement of coats of arms according to the varying artistic styles.

Heresy and Religious Dissent

The Christian notion of heresy, or false teaching, emerged in the first years of the church's existence. Powerful differences of opinion about the meaning of Jesus and his words led to struggles that threatened to tear apart the tiny Christian communities. Purity of doctrine became a major concern of Christian leaders, who began to experiment with methods of controlling dissent. The Greek word *haeresis* (choice), originally a neutral term for a sect or a school of philosophy, began to be used to describe divisive teachings emanating from "those who have lost their grip on truth" (1 Timothy 6:5). Various Pauline and Petrine epistles (Galatians 5:20, Ephesians 1:10, 2 Timothy 2:17, Titus 3:9–11, 2 Peter 2:1–9) warn of the dangers of heresies and those who foster them. First Corinthians (11:18-19) provides the classic justification for the existence of such disturbances in the church: "There must be heresies, so that those who are sound may be manifest among you." Titus (3:10) offers a common solution: expulsion of heretics from the community.

Heresy soon came to serve an important function for early Christians: its perceived errors, along with those of paganism and Judaism, were used to help distinguish authentic from false teachings. The notion of heresy reinforced the church's reliance on the scriptures and apostles as sources of authentic doctrine, and on the bishops as authoritative teachers. It also led to the development of the "rule of faith," a uniform set of essential beliefs handed down from the apostolic church that were to be used to test suspicious doctrines. In the fourth century, the general council, a meeting of all the bishops in the church, became the ultimate authority in determining the apostolicity of a teaching.

Uniformity of belief remained a constant goal of late Roman Christianity, but it was never realized. From the third to sixth centuries, intense speculation about Christ's nature as God and man led to a series of widely held doctrines—Docetism, Sabellianism, Adoptionism, Arianism, Apollinarianism, Nestorianism, Monophysitism,

Monothelitism—which were eventually condemned as heresies. At the same time, discussions of sin, divine grace, and ecclesiastical authority produced Pelagianism and Donatism, which were also condemned. As these doctrines were debated, each side accused the other of heresy. Decades and sometimes centuries passed before the debates were finally resolved.

The conversion of Emperor Constantine early in the fourth century presented Christians with a new method of dealing with heresy. By 392, Christianity was the only legal religion in the Roman empire. Christians came to control state authority and used it to coerce and punish heretics. Roman law now prescribed confiscation of property, branding, exile, and even execution for heresy. Roman police and soldiers were used against dissenters. By the time the Roman government of western Europe collapsed in the sixth century, the idea that heretics were a serious danger to the state as well as the church, and consequently liable to capital punishment, was well established in western Christian thought.

From the barbarian invasions of the fifth century to the economic revival of the eleventh, heresy lost much of its urgency for western Christians. Conversion of the largely heathen Germanic peoples became a greater concern than suppression of heterodoxy. These new converts were more likely to relapse into pagan ways or apostasize than to embrace heresy. Only a few heresies were noted during this period, mostly relics of the past like the Adoptionism of the Carolingian bishop Felix of Urgel.

This situation began to change in the early eleventh century. A growing interest in religious reform and the apostolic life brought with it a revival of heresy. Among the clerical elite, increased theological speculation produced much doctrinal controversy and occasional heterodoxy. This type of heresy, often called "learned" or "intellectual" by modern scholars, usually centered on some relatively recondite issue, as in the case of the eleventh-century scholastic Berengar of Tours. Berengar denied that the bread and wine in the eucharist changed substantially into Christ's body and blood. His denial was rooted in his interpretation of the newly developed scholastic notion of substance. Predictably enough, heresies like Berengar's attracted few followers. Authorities successfully dealt with those few by public

condemnation.

The other major type of heresy, often called "popular" by modern scholars, presented a greater problem for church leaders. Popular heresies emerged from the religious concerns of ordinary laymen and occasionally found wide support. They first appeared among isolated groups of peasants and townsmen in various parts of Europe during the eleventh century. Occasionally they were led by clerics. Though their specific doctrines varied, many seem to have been inspired by the contemporary monastic reform movement. The reformers identified monastic practice—poverty, chastity, and obedience—with the perfection taught by Christ and the apostles in the gospels. The leaders of popular heresies did the same, frequently demanding an austere life, poverty, and chastity of their lay adherents. Their certainty that they were following the commands of Christ led some to reject priestly authority when they were opposed by the clergy. Condemnation for heresy usually followed.

Popular heresy tapered off in the second half of the eleventh century, perhaps because the enthusiasm it represented was absorbed by the reform movement headed by the Gregorian papacy. But it quickly resurfaced in the early twelfth century as the papal reformers began to compromise with local churches. Continuing the fight against clerical corruption became a major concern of the popular religious movements of this era, which again identified poverty, and now preaching, with apostolicity. Their leaders were quick to reject clergy who failed to meet strict standards, just as Gregorian reformers had done a few decades earlier. Arnold of Brescia, for example, attacked even the papacy for failing to meet apostolic standards of poverty. Henry of Lausanne and Peter of Bruis denied the scriptural basis of both clerical authority and the sacraments that clerics dispensed.

Despite the persecution of these heterodox groups, the notion that the life of the apostle—poverty and preaching—was for all Christians, not just the clergy, was widespread by the late twelfth century. It became a significant strain of lay spirituality, reflecting a new desire on the part of laymen to have greater control of their religious lives. Urban laymen, especially, conceived of the poverty of the apostles in a novel way: not as the pooling of goods typical of the monastery, but as the precarious day-to-day existence of the contemporary urban beggar. This

image of the begging apostle became a source of intense friction between laity and clergy in the later Middle Ages, a rebuke to clerical wealth and power. Various groups imitating the begging apostles emerged in the late twelfth century. Two, the Franciscans and Dominicans, were approved by the papacy as mendicant religious orders and served it as important opponents of heresy in the thirteenth century. But many groups were condemned as heterodox. The most successful group was the Waldensians, founded by the merchant Valdes at Lyon in the 1170s. After being accused of heresy and driven from Lyon, the Waldensians spread through France, Italy, and Germany. Although some sought reconciliation with the church, others asserted that the Roman church had lost its authority when it took on wealth in the time of Constantine. They insisted on following all the commands and precepts of Christ, even those traditionally reserved to the clergy, and resisted the authority of the clergy who opposed them. The Waldensians saw themselves as a remnant of Christ's "true church" that had preserved its doctrines untainted from apostolic times. Loosely organized around their own lay ministers, Waldensian communities managed to survive throughout the Middle Ages, primarily in rural areas. They were the first medieval heterodox movement to find a wide following and to flourish despite clerical persecution. Several Waldensian doctrines became hallmarks of the late medieval heresies that focused on apostolic poverty: the mendicancy of the apostles, the apostleship of all believers, the rejection of clerical authority as unapostolic, and the identification of a small group of righteous believers as a faithful remnant living in a larger church that had succumbed to corruption and error.

Catharism, the other great popular heresy of the later Middle Ages, had origins very different from those of the Waldensians, but the Cathars—or "pure ones"—did share the Waldensians' disdain for ecclesiastical wealth. The Cathars were dualists who first appeared in France and the Rhineland during the mid-twelfth century. They became particularly strong in southern France. Cathars seem to have drawn their doctrines from the Bogomils of the Balkans. According to their Catholic opponents, whose testimony is the only record of their beliefs, they asserted the absolute incompatibility of spirit and matter, soul and body. God and Satan were the principles of good and evil, respectively:

one the creator of the spiritual world, the other of the material world. The souls of humans and other living things were angels trapped by Satan in matter; only extreme ascetic practices would render a soul pure enough to avoid transmigration to another body after death. Cathars also rejected Christ's divinity, the sacraments, the priesthood, and the authority of the church. They accepted the New Testament but interpreted it symbolically. Cathar communities apparently maintained a degree of order by imitating the Catholic hierarchy; they had "bishops" and "deacons" who administered a rite of initiation, supervised public confessions, and taught doctrine. As a result, the Cathars were perceived by Catholic authorities as an alternative church and were considered an enormous threat.

The Waldensians and Cathars presented a particularly serious challenge to clerical authority. Clergymen were at first divided on how to contend with them. Some emphasized Saint Augustine's comparison of heresy with contagion and sought drastic measures, but others counseled persuasion. Bishops, who had the traditional task of discerning and combating heresy, were often unwilling or unable to deal with well-established communities of Cathars and Waldensians. Exclusion from the diocese, the common episcopal penalty for heresy, had little effect other than to spread the heretics' doctrines. Until the pontificate of Innocent III (r. 1198-1216), the papacy merely encouraged bishops to do their duty. Innocent took a more direct approach. He sent many preachers against the heretics, not only clergy but moderate Waldensians and other groups recently reconciled to the church. Later the newly founded mendicant orders spearheaded this campaign. Innocent also dispatched papal legates to prod bishops to action. When a papal legate was murdered in southern France in 1209, Innocent called a crusade against the Cathars of the region. This was the first time a crusade was used against heretics rather than unbelievers. It was only partly successful: it killed some of the Cathars but drove the survivors underground. To find them, Pope Gregory IX instituted the papal Inquisition in 1231. Inquisitors were special judges appointed by local bishops or by the pope to enter specific areas where heresy was suspected and uncover it. Often members of the mendicant orders, inquisitors were given broad powers in interrogating suspects, including the use of torture after 1252. Penitent heretics were fined and

given penances; those who relapsed or refused to admit their error were turned over to the secular authorities for punishment. Many were executed. With the help of secular rulers, inquisitors managed to wipe out the Cathars by the mid-fourteenth century. The Waldensians survived but were driven into remote areas.

The Inquisition kept heresy in check but did not end it. A stereotype of the heretic developed, inspired by patristic sources. Heretics were supposedly victims of their own pride, and thus obdurate when corrected by church authorities. Their pride drew them into the clutches of Satan, who then directed their teaching. This accounted for the similarity in doctrine among heresies, as well as for heretics' cleverly feigned piety. Satan also drew heretics into various kinds of depravity, which explained their secretiveness. Armed with these presumptions, inquisitors often infused the teachings of heterodox groups.

After the turn of the fourteenth century, popular heresies and learned heresies became much more closely connected. By then, heresy among scholars had become a significant problem. The growing influence of Aristotle's philosophy, in particular, was creating severe tension within the essentially Neoplatonic framework of traditional patristic theology. Controversy dominated the universities. In 1277, conservative synods at Paris and Oxford condemned a long list of Aristotelian ideas, targeting not only radical Aristotelians like Siger of Brabant but also moderates like Thomas Aquinas. Aristotle's ideas were gradually accepted, but only with careful reservations. A reminder of their danger came in the 1320s, when the Parisian master Marsilius of Padua used Aristotelian political theory to fashion a radical attack on papal leadership of the church in his *Defensor pacts*.

At about the same time, apostolic poverty returned as an important doctrinal issue. The Spirituals, a rigorist faction within the Franciscan order, criticized the order's observance of Christ's poverty as lax and demanded the imposition of a stringent "poor use." When they were resisted by the majority of the order and the papacy, the Spirituals retreated into apocalyptic speculation that identified the Roman church as the "whore of Babylon" mentioned in the Book of Revelation, and depicted their own faction as Christ's faithful remnant. The Spirituals were officially suppressed in 1318, but their followers flourished in northern Italy as Fraticelli and in southern France as Beguins until the

1330s.

Meanwhile, there was a more theoretical dispute about Christ's poverty between Pope John XXII and the leadership of the Franciscan order. This led to the excommunication of the order and a long polemical struggle in the 1320s and 1330s, and it injected discussions of apostolic poverty into learned heresies. Marsilius of Padua used the dissident Franciscans' arguments in his attack on papal leadership in 1324. Later in the century, the English theologian John Wycliffe also drew on them when he launched a broad attack on clerical authority. Discussing the property of the church, Wycliffe asserted that no sinful person, even a priest, could exercise rightful ownership, and that consequently such a sinner could have no other authority or jurisdiction. Wycliffe also rejected the necessity of the clergy or their sacraments for salvation, and he sought true doctrine in the Bible alone rather than in the church's teachings. In the thought of the dissident Franciscans and Wycliffe especially, one can see a fusion of popular and learned heresies, a blending of passionate concern for apostolic poverty with complex scholastic analyses of possession and church order.

Wycliffe's views were condemned in 1377 and again in 1382, but his adherents, called Lollards, spread them throughout England and later into Bohemia. There they became part of an incipient Czech nationalist movement. When the most prominent Bohemian disciple of Wycliffe, John Hus, was burned for heresy at the Council of Constance in 1415, his followers rebelled against both the religious authority of the pope and the political control of the German emperor. They used the teachings of Wycliffe to justify their actions. The Hussites were not defeated until the late 1430s, after a long and difficult war.

Wycliffe, Hus, and other medieval heretics were later claimed as predecessors by Protestant reformers. Modern historians point to their dissenting tradition as the Forerunner of contemporary religious pluralism. Tolerance, however, was slow in coming. Protestants as well as Catholics continued to persecute dissenters well into the modern era.

Historiography

Since Italy did not become a unified state until the late nineteenth century, the study of its past has tended to be both more regional and more international than that of countries such as France and England, which were already separate kingdoms in the Middle Ages. Because of the inclusion of its territory north of the papal state in the Holy Roman empire, much of its medieval history has been considered in close relation with that of Germany. Also, the presence of the papal see in Rome and the impact of Byzantine and other Mediterranean influences on developments in southern Italy and in Sicily and Sardinia have led to a widening of the scope of historical inquiry well beyond its immediate frontiers. At the same time, the division of the country until recent times into distinct political units has encouraged the growth of strong local historical traditions, a tendency which has to some extent persisted to the present day because of the dispersion of archival records among the diverse centers in which they were originally kept, leading scholars to concentrate more on the study of particular places than has been the case in states which had centralized monarchies from an early period.

Despite the lack of a national focus for Italian history before the past 150 years, the recognition, from the Renaissance onward, of the cultural unity of the region to which it applied fostered the emergence of a historiography concerned generally with it. In the *Quattrocento*, the humanist Flavio Biondo of Forlì produced his *Decades*, completed c. 1453, a survey of developments in Italy since the fall of the Roman empire, of which the first twenty books dealt with the period up to 1402. Biondo's method, in accordance with Renaissance conventions of historical writing, was narrative; his sources were chronicles rather than archival records. A fuller, more scholarly treatment of the same

subject was provided more than a century later by Carlo Sigonio in *De regno Italiae* (*Of the Kingdom of Italy*, 1576). This work, which followed from a previous one concerned with the history of the late Roman empire, concentrated on the emergence of the distinctive institutions of medieval Italy up to 1286, considering the contribution both of the late imperial period and of the barbarian invasions. Whereas Flavio Biondo had intended to bridge the gap between the decline of Rome and his own day by tracing the collapse and then the recovery of ordered government and civilization, Sigonio was more interested in the Middle Ages as such and sought to chart the evolution of new forms of political organization through the periods of Ostrogothic, Lombard, and Frankish domination. Even so, his approach to history remained essentially descriptive, and he retained the narrative structure of his humanist models.

The transition from a concept of historical writing as a literary exercise aiming at elegance of style to one requiring erudition and the collation of original sources (which Sigonio had begun to effect) was carried to its fulfillment in the early eighteenth century by Ludovico Antonio Muratori. Muratori's position as librarian of the Este in Modena and his access to records in Milan and elsewhere convinced him of the need to bring to light the great wealth of documentary and other manuscript material scattered in various official, private, and monastic collections in Italy. To make the main narrative sources of its history in the Middle Ages generally available, he embarked on the ambitious project of publishing the most important of them in *Rerum italicarum scriptores* (of which the first volume appeared in 1723 and the last, under his editorship, in 1738). Inspired by Jean Mabillon's annals of the Benedictine order, which had set new standards of critical scholarship in the examination and evaluation of documents, Muratori also attempted, in his *Annali d'Italia* (of which the first nine volumes, written between 1738 and 1744, covered the period from the fifth to the fifteenth centuries), to establish an accurate chronological sequence of events for Italian history, grounded in chronicles and other sources. The most interesting and innovative of all his works, however, was *Antiquitates Italiae medii aevi* (published between 1738 and 1742), which, in a series of separate disquisitions on various aspects of constitutional and social history, gathered together documentary

material illustrating the institutions and everyday life of medieval Italy.

By 1750, when Muratori died, a sound scholarly basis had been laid for Italian historical writing on the Middle Ages, but the treatment accorded to it remained largely descriptive. As a result of the influence of the Enlightenment and the French revolution, more interpretative approaches came to be adopted, and historical works, previously often written in Latin, used the vernacular to reach a general, less narrowly academic audience. In Carlo Denina's *Delle rivoluzioni d'Italia* (1769-1770), the rationale for explanation remained somewhat crude and simplistic, being based on the idea that adversity made peoples robust, energetic, warlike, prolific, and self-reliant while prosperity brought self-indulgence, corruption, and decadence. Denina thus saw Italian history as passing through a cycle of progress after barbarism had reinvigorated the effete society of the Roman empire and of decline after this, in turn, produced degeneration and a loss of virtue. J. C. L. Sismonde dei Sismondi, a Genevan historian who wrote his sixteen-volume *History of the Italian Republics in the Middle Ages* in French between 1796 and 1818, shared with Denina the view that Italian medieval society had displayed its greatest vitality in the twelfth century, but he attributed this not to primitive vigor but to a love of freedom. Sismondi saw the Italian communes of that time as originators of the civilization, commerce, and popular government which were to become characteristic features of western Europe. Deviating from the tradition of Muratori, who had admired the Lombard kingdom of Italy and princely rule and had criticized the turbulence of democratic regimes, Sismondi initiated what was to be a prominent motif in Italian medieval studies: a tendency to see the city-states (at least before the rise of the *signorie*) as nurseries of the values of the modern world.

Influential though Sismondi's work was later to become, its impact in the early nineteenth century came to be overshadowed, for professional historians, by that of German critical scholarship, which brought greater rigor into research in the considerable area of medieval history shared by Germany and Italy. From 1826 onward, Georg Heinrich Pertz and his successors provided, in *Monumenta Germaniae Historica*, a more competently edited set of sources on this field than had hitherto been available. Between 1829 and 1832, Heinrich Leo published his

History of the Italian States; this was followed in 1847 by Karl von Hegel's history of state-formation (*Städtverfassung*) in Italy, in 1863-1873 by Julius Ficker's research into Italian political and legal history, and in 1897 by L. M. Hartmann's history of Italy in the Middle Ages. These authors concentrated on political history and the evolution of institutions in Italy up to the High Middle Ages and based their conclusions on the evidence not merely of chronicles but also of newly assembled and printed collections of documentary material.

The impulse given to archival research by these studies was reinforced by the stimulus to historical writing provided by the Risorgimento and the unification of Italy. Authors such as Cesare Balbo and Carlo Troya were inspired by the romantic patriotism characteristic of what has been described as the "liberal-Catholic" or "neo-Guelf school. But a far more enduring contribution to historical scholarship was made by the many periodicals and institutions founded in the decades immediately preceding and following the attainment of Italian nationhood: Archivio Storico Italiano in 1842, Deputazioni di Storia Patria for the country's different regions from 1859 onward, Istituto Storico Italiano per il Medio Evo (whose *Bullettino* first appeared in 1883), *Rivista storica italiano*. in 1884, and such local historical journals as *Archivio veneto* and *Archivio storico lombardo* at various dates in the late nineteenth century. The opening up of opportunities for the publication of specialist studies and the issuing of new collections of sources, such as the revised edition of *Rerum italicarum scriptores* (the volumes of which began to appear in 1900), *Fontiper la storia d'Italia* of the Istituto Storico Italiano (from 1887), and *Regesta chartarum Italiae* (from 1907), enabled scholars to engage in a far more intense exploration of Italian medieval history than had previously been possible.

Indeed, a paradoxical effect of national unification was its encouragement of the specialized study of local history. Ever since the sixteenth century, rich traditions of historical scholarship had developed within the states making up Renaissance and baroque Italy, In Milan, Bernardino Corio had, in 1503, published his history of his city; between 1760 and 1771, Giorgio Giulini produced his *Memorie* regarding the history, government, and description of the city and countryside of Milan in the Middle Ages. Another late eighteenth-

century antiquarian, Gian-Battista Verci, had, not long afterward, compiled his twenty-volume history of the March of Treviso and Verona (1786-1791). Marino Sanuto, with his *Vite dei dogi* (written between 1493 and 1530), had initiated what was to become a distinguished historiography devoted to medieval Venice; in Florence, Scipione Ammirato laid a firm foundation for subsequent work on its early history with his account of it published in 1600. Two extensive histories of Naples, by Giovanni-Antonio Summonte in the late seventeenth century and by Pietro Giannone (a contemporary of Muratori) in the early eighteenth, provided the same kind of groundwork for southern Italy; the first half of each of these histories covered the medieval period. Indeed, the work by Giannone, *Istoria civile del regno di Napoli* (1723), had an importance transcending its local subject matter, becoming a model in its day for the composition of a "civic" history.

To this already considerable historiography of substantial studies on particular places were added, in the course of the nineteenth century and the early twentieth, a series of works enriched by archival research and a growing periodical literature. The histories of Venice by Samuele Romanin (1853) and Heinrich Kretschmayr (1905-1920) and those of Florence by Gino Capponi (1875), Francis Perrens (1877-1883), and, on a more monumental scale for the period up to 1328, Robert Davidsohn (1896-1927) established the detailed study of the evolution of a republican city-state and its culture as a significant genre in Italian historical writing. In the treatment of the larger field of southern Italy, Italian and French scholars focused more on particular periods, in works such as Michele Amari's *Storia dei Musulmani in Sicilia* (1854-1872) and *Laguerra del vespro siciliano* (1842-1843); Roberto Caggese's *Roberto d'Angiò e i suoi tempi* (1922-1930); and three monographs by authors associated with the French academy in Rome: Jules Gay's study of southern Italy and the Byzantine empire (1904), Ferdinand Chalandon's study of the Norman domination in southern Italy and Sicily (1907), and Emile Jordan's study of the origins of the Angevin ascendancy in Naples (1909). Another French scholar, Charles Diehl, had earlier, in 1888, dealt with the Byzantine penetration into northern Italy. The history of Rome in the Middle Ages, previously studied more for its connections with the papacy than in its own right,

was addressed in an extensive work published in German between 1859 and 1872 by Ferdinand Gregorovius. The individual seignorial states of the Lombard plain attracted less scholarly attention at this time than might have been expected, perhaps because of the paucity of their archival records during the medieval period. But a general historiography relating to them did emerge with Carlo Cipolla's *Storia delle signorie italiane* (1881), Ernst Salzer's study on the origins of these regimes (1900), Francesco Ercole's *Dal comune al principato* (1929), and Luigi Simeoni's *Le signorie* (1950).

The production in the late nineteenth century and the early twentieth of detailed and well-researched political histories of the various regions of Italy encouraged scholars to move away from a concern with the mere narrative of events into new fields, such as economic developments and the connections between social groups and civic conflicts. Alfred Doren, a German economic historian, in 1897 and 1901, brought out two pioneering studies of the guilds and the woolen industry of Florence (before issuing his survey of Italian economic history in the Middle Ages in 1934). Italians such as Gino Luzzatto, Armando Saporì, and Roberto Lopez followed his lead, exploiting the previously neglected account books and other business records of Florentine, Venetian, and Genoese merchants. They promoted a view of Italian history as animated by the dynamic energy of capitalist enterprises which had their heyday in the half-century before the black death and by that time had already evolved thoroughly modern financial and trading practices. The impact of the growth of this commercial economy on politics had been considered earlier, in a somewhat Marxist interpretation, by Gaetano Salvemini, whose *Magnati epopolani a Firenze dal 1280 al 1295* (1899) attempted to explain the conflict between the old aristocracy and the *popolo* in late thirteenth-century Florence as a clash between a landed nobility and a new "bourgeois" class. His analysis of these social groups was, however, rejected by Nicola Ottokar, who, in *Il Comune di Firenze alla fine del Duecento* (1926), chose instead to see the developments of this period as expressing tension within a single elite or *ceto dirigente* (as he described it) that included families with both landed and commercial wealth. The close examination of the links binding this social stratum together which Ottokar undertook to sustain his argument was to

become a feature of much work done in the twentieth century on late medieval Italian city-states. To some extent, detailed studies of small groups had been anticipated earlier by another historian who had begun to write c. 1900, Gioacchino Volpe. In his work on the communal institutions of Pisa (1902) and in his dissections of the social fabric of some smaller communities of Tuscany and Lunigiana, Volpe provided models for a historiography concerned with relating the exercise of political power to the texture of relationships underpinning it.

In the postwar period, concentration on this social substructure of a history formerly viewed as a sequence of significant events made for a preference for studies of particular places within limited time spans. Some of these, such as those by Enrico Fiumi on San Gimignano (1961) and Prato (1968) and those of David Herlihy on Pisa (1958) and Pistoia (1967), have had a strong economic and demographic emphasis. Others, such as Emilio Cristiani's *Nobiltà e popolo nel comune di Pisa* (1962), have focused more on connections between families, factions, and the political process. Still others, such as Gene Brucker's *Florentine Politics and Society 1343-1378* (1962), Marvin Becker's *Florence in Transition* (1967-1968), and Daniel Waley's monographs on Orvieto (1952) and the papal state in the thirteenth century (1961), have preserved a traditional chronological arrangement of subject matter but attempted to link the developments examined in this way to their social background. One notable feature of this postwar historiography has been the contribution of Anglo-American scholars, whose concern with detailed empirical studies has left its mark. The many works of Frederick Lane on Venice, Robert Brentano's *Rome before Avignon* (1974), John Larner's *Lords of Romagna* (1965), J. K. Hyde's *Padua in the Age of Dante* (1966), William Bowsky's study of Siena under "the Nine" (1981), and Christine Meek's study of Lucca between 1369 and 1400 (1978) have illuminated the distinctive character of particular Italian communities in the later Middle Ages. The commissioning of large-scale collective histories such as those of Milan (1954-1960), Naples (1967-1971), and Ferrara (1987-) from Italian specialists has accentuated this trend toward dividing the country into separate fields of historical inquiry. This tendency has, however, been balanced by the compilation of thematic histories of Italy as a whole, such as those published by Einaudi between 1972 and 1977 and by UTET since 1978.

A significant recent development in the study of medieval Italy has been the recognition accorded to its rural society, whose importance had previously been overlooked because the history of the north and the center was considered essentially that of their cities. Beginning with Johan Plesner, a Danish student of Ottokar, whose study of emigration to Florence from its *contado* in the thirteenth century (1934) showed that it was not serfs escaping from feudal bondage but the most prosperous peasants who moved to the city, a school of historians has grown up. The members of this school have argued that during the later Middle Ages and the Renaissance, the land around towns came increasingly into the hands of their citizens, who exploited it as a means of accumulating capital for trade and industry and of keeping down the cost of food for urban populations. Elio Conti in *La formazione della struttura agraria moderna nel contado fiorentino* (1965) and Giovanni Cherubini in his studies of the Sienese *contado* have produced strong evidence supporting this interpretation. The English historian Philip Jones has joined them in vindicating the general importance of developments in the rural economy for an understanding of urban history. Other scholars, such as Pietro Torelli in his studies of the Mantuan *contado* (published in 1930 and 1952) and L. A. Kotelnikova, have done valuable work on forms of land tenure and the relationship between town and country in the High Middle Ages. The tendency to revise a traditionally city-dominated view of Italian history has also been reinforced by the work of Giorgio Chittolini, who has shown that the growth of a regional state in the later Middle Ages was accompanied not by a weakening but by a consolidation of rural lordships, in a process he has described as 'refeudalization.' These studies have rectified previous distortions in emphasis in Italian medieval history and have demonstrated a continuity between the predominantly rural aristocratic society of the thirteenth and fourteenth centuries and that of the early modern period.

Since World War II, much scholarly interest has focused on northern and central Italy and on sociopolitical developments, but important contributions have continued to be made in other areas as well. New critical studies of the reign of Emperor Frederick II by T. C. van Cleve (1972) and David Abulafia (1988) have shed light on the south of the peninsula in the High Middle Ages. In economic history, the work done

on prices, wages, and living standards by scholars such as Charles de la Ronciere and Guglielmo Pinto has illuminated previously neglected facets of the lives of ordinary people; and the exhaustive examination of the Datini archive by Federigo Melis has provided a much clearer understanding of late medieval business practices. In these studies, as in other recent work, the mastery of detail deriving from research into new bodies of source material has tended to refocus attention in Italian medieval history from the large perspectives of the past to carefully observed, specific evidence of forms of activity once regarded as insufficiently significant to warrant close exploration.

Hohenstaufen Dynasty

The monarchs of the Hohenstaufen (Swabian, Waiblingen) house were

committed to a revival of German imperial power after a period of erosion. They first strove to reassert that power in German lands, where the great German princes were achieving something approaching independence. The Hohenstaufen sovereigns also revived the traditional efforts of German monarchs to manipulate the offices and wealth of the church to their advantage; these efforts set the Hohenstaufen once again at odds with the reforming programs of the papacy, as in the earlier investiture controversy, and augured a renewed German involvement in Italian affairs. Moreover, the Hohenstaufen also chose to reassert the territorial rights and ambitions in Italy that had been nurtured by the Ottonian and Salian emperors. Gradually, their involvement in Italy became a preoccupation and then an obsession, ending in nothing less than the total destruction of the dynasty.

The first Hohenstaufen sovereign, Conrad III (r. 1138— 1152), was continuously engaged in struggles against the restless German princes. He did form an alliance with the Byzantine emperor, Manuel I, which bound him to put pressure on the ambitious Norman king Roger II. But Conrad's rash involvement in the Second Crusade (1147—1149) instead freed Roger to attack Byzantine territories, while any further involvement in Italy by Conrad was precluded.

Conrad's nephew and chosen successor, Frederick I Barbarossa (r. 1152-1190), brought new energy and a dramatic new scope to Hohenstaufen policies. Frederick, a charismatic figure with a profound consciousness of the history and glories of the Roman and German imperial tradition, boldly pursued policies that were unrealistic in the face of changing circumstances; but the very force of his pretensions gave him an awesome status.

Frederick was eager to recover control of territories previously under the sway of the German emperors beyond Germany itself, especially the wealthy regions of northern Italy. However, the new and lively Lombard towns that had emerged there resisted Frederick's efforts to impose his control on them; they coalesced into a series of leagues that offered formidable opposition. At the same time, tension, and then outright hostility, developed between Frederick and a series of popes, eventually prompting Pope Alexander III to ally the papacy with the stubborn Lombard towns. Frederick conducted a series of no fewer than six expeditions into Italy between 1154 (when he renewed the German

claim to an imperial coronation in Rome) and 1186. At his strongest, he was able to humble and devastate rebellious Milan in 1162, but the Lombard League revived to defeat him at the battle of Legnano in 1176. Through the intervention of Venice, Frederick was reconciled to the pope (1177); and by the Peace of Constance (1183) the Lombard towns accepted the emperor's token suzerainty in exchange for recognition of their effective independence. Still, Frederick did enhance his authority in northern Italy slightly in his last campaign there (1184-1186).

Frederick I achieved his most spectacular success in Italy by negotiating (1186) the marriage of his son and heir Henry (later Henry VI) to Constance, who was the daughter of Roger II and the heiress of the childless Norman king, William II. Henry asserted his claims to the Norman throne when William died (1189), although five years of struggle against the Normans' resistance delayed his coronation until 1194. Meanwhile, when Frederick I died on the Third Crusade, Henry succeeded to the dynasty's German titles and rights. A hardheaded and determined ruler, Henry VI (r. 1190-1197) opened the prospect of uniting German and Italian sovereignty under Hohenstaufen leadership that would be the most powerful force in western Christendom. The birth of his son, Frederick (later Frederick II), in 1194, gave Henry VI an heir through whom this fusion of sovereignties would be confirmed.

But amid plans for further extension into the eastern Mediterranean world, Henry VI died prematurely and unexpectedly. Chaos and conflict ensued in both Germany and Italy. Henry's son Frederick was eventually consigned to being a ward of the papacy, under Innocent III (d. 1216), and became a pawn of international politics as rival forces squabbled over his heritage. Only when Frederick was in his late teens did Innocent support the boy's rights, and even thereafter Innocent always presumed to dominate Frederick.

However, Frederick II (r. 1212-1250), precocious and willful, emerged as his own man. He was half Norman in blood and Sicilian in outlook, and he virtually ignored his German realms; instead, he nurtured the lands of his Norman kingdom, and it was on these that built his true power and lavished his patronage. Meanwhile, his relations with the successors of Innocent III deteriorated and then became violently hostile as Frederick sought domination over all of Italy. His efforts provoked renewed opposition to Hohenstaufen ambitions from a

revived Lombard League, led again by Milan. Frederick achieved a temporary advantage with his victory at Cortenuova (1237), but his ruthless ambition drew unrelenting opposition from the papacy, which recognized him as a threat to its political status in Italy. Popes Gregory IX and Innocent IV used all their spiritual, diplomatic, and military resources to arouse local and international resistance to Frederick. Despite some setbacks, though, it was Frederick's own poor health that brought him down; he died suddenly in 1250.

Conrad IV (r. 1250-1254), the surviving legitimate son and designated heir of Frederick II, attempted to pick up the threads of the dynasty but was defeated and killed by forces that the implacable pope had marshaled. This failure led to a period of nearly twenty years called the "great interregnum" in Germany, but it did not end the hopes of the Hohenstaufen in Italy. Frederick's illegitimate son, the able and ambitious Manfred, was established as regent in Sicily and now assumed control of the old Norman realm; he achieved the coronation as king in 1258 and then attained powerful influence in northern Italy. Manfred inevitably faced determined opposition from the papacy, and Pope Urban IV brought the French prince Charles I of Anjou to Italy as a new champion against the Hohenstaufen. Manfred was defeated and killed at the battle of Benevento (1266); thus Charles was left to consolidate his power in Italy in his own right. The pro-imperial elements in Italy were desperate but played one last card: Conrad IV had died, and they persuaded his young son Conradin to assert the claims of the dynasty. The hapless Conradin was defeated at Tagliacozzo (1268) and was betrayed to Charles, who with high-handed brutality had him publicly beheaded in Naples. After that, hopes of a united kingdom of Italy in the Middle Ages were doomed, and the prospects for a future domination of the peninsula by a German (Holy Roman) emperor depended on the ephemeral successes of the Hapsburg Charles V.

The interests of the Hohenstaufen in Italy effectively came to an end in 1268, but the Hohenstaufen still carried credit in some quarters. King Peter (Pedro) III of Aragon had married Manfred's daughter Constance, and in her name professed to be the vindicator of the Hohenstaufen. Accordingly, during the episode known as the Sicilian Vespers (1282), Pedro snatched the crown of Sicily from Charles of Anjou for himself

and his descendants. By virtue of that connection, Hohenstaufen ghosts would haunt more than two centuries of conflict between the Angevins and the Aragonese over control of the old Norman kingdom in Italy.

Holy Roman Empire

The origins of the medieval empire are to be found in the development of the Frankish monarchy and particularly in its expeditions in Italy in the late eighth century. The decision of the papacy to seek an alliance with the Frankish rulers in order to bolster its position vis-a-vis the Lombards and the Byzantine empire substantially altered relations between Italy and Gaul. Whereas Charles Martel, mayor of the palace, refused to send help to Pope Gregory III in 739, his son, Pepin, in pursuit of the Frankish throne, sought the aid of Pope Zachary. Shortly thereafter, Pope Stephen II found himself faced with a threat from the Lombards and asked Pepin to intervene. Stephen granted Pepin the title "patrician of the Romans," thus investing him with an imperial office and commencing a process which would culminate in the establishment of an empire in the west less than half a century later. Pepin, on his side, defeated the Lombard king and "donated" the lands he had conquered in central Italy to the papacy. Although the Byzantines demanded the return of these lands, Pepin persisted in granting them to the papacy, thereby reinforcing the ties between the Frankish monarchy and the popes.

The coronation of Pepin's son, Charles, known as Charlemagne, as emperor on Christmas day 800 in Saint Peter's basilica has aroused controversy almost from that day to the present. However, this coronation was more the culmination of a political process than the result of a sudden decision. In 773, Charlemagne had followed up on the policy of his father by laying siege to the Lombard capital of Pavia and taking the crown for himself. With the extinction of the Lombard monarchy, the kingdom of Italy was joined to that of the Franks. The actual circumstances surrounding the coronation of Charlemagne as emperor have tended to obscure any link to the earlier policies of the Carolingians and the papacy. Traditionally, emphasis has been placed on the situation of Pope Leo III, who found himself at the mercy of a rebellious faction in Rome and sought the aid of Charlemagne. After restoring the pope, Charlemagne himself came to Rome to settle the dispute between Leo and the rebels. The pope was allowed to take an oath clearing himself of all charges. According to the Frankish annals, the council that had deliberated the problems of the papacy also discussed the issue of the empire and persuaded Charlemagne to accept the imperial title. However, in the account given by Charlemagne's

secretary and biographer Einhard (c. 770-840), Charlemagne's son, Louis the Pious, maintained that Charlemagne had been unaware of the pope's intention to crown him and had complained about it afterward. However, Einhard places this event in the context of a discussion of the manner in which Charlemagne bore the jealousy of the Byzantine rulers; this context suggests that Einhard's aim was to portray his subject in the very best light with respect to the eastern emperors. Perhaps the account in the Frankish annals lies closer to the truth. In any case, though, Charlemagne assiduously sought recognition of his imperial title by the Byzantines until he gained it from Emperor Michael in 812.

Much has been written about the impact of Charlemagne's coronation by the pope, with numerous historians suggesting that Charlemagne's supposed opposition may have stemmed from some premonition that it boded ill for the future of the empire. However, there is no evidence in contemporary accounts to support this view, and it seriously distorts the relationship between Charlemagne and the church and papacy. Charlemagne had taken up the policies of his father in promoting ecclesiastical reform, building on the foundation laid by Saint Boniface. He promoted education, the Roman liturgy, the Latin vulgate Bible, and monastic reform, although the triumph of the Benedictine rule did not come to fruition until later, under the direction of Benedict of Aniane during the reign of Louis the Pious. In all these endeavors, Charlemagne worked closely with the papacy. There was a partnership, though not without friction, as is evident in the *Libri Carolini*, which favored Charlemagne's view of the iconoclastic controversy. But Charlemagne usually steered clear of theological issues. For its part, the papacy found the support of the Carolingians important in maintaining its position in Rome. Not surprisingly, the position of the papacy became stronger during the course of the ninth century, even when the Carolingian empire entered a decline in the second half of the century. There is little in this period to fit the picture of a conflict between church and state that so strongly influenced historical writing well into the mid-twentieth century. Rather, imperial coronation corresponded to changes in political and religious relationships during the eighth century. Though it certainly owed much to earlier views of empire, it represented new circumstances that had

begun to emerge in Europe under the Frankish monarchy. Imperial ideology was thus conjoined to political reality.

Carolingian rule weakened following the division of the realm among the sons of Louis the Pious; this had a destructive effect on the unity that the empire had come to signify. Yet the imperial title endured, or claimed to rule, in northern Italy. The association of Italy with the empire suggests that there was at least some kernel of territorial identity in the notion of the medieval empire. Charlemagne had been lauded as "Augustus," and in the imagination of the elites the idea of Rome could not be separated from that of the empire. The revival of the empire under the Saxon kings, who had succeeded to the eastern Frankish monarchy in the tenth century, was identified closely with the notion of imperial Rome as well as that of the Carolingians. In fact, some of these monarchs evidently tended to stress the Roman over the Carolingian heritage.

However, it was as imperial successor to Charlemagne that Otto I was crowned in 962, after he had succeeded in extinguishing the imperial title, which had been held by Berengar of Ivrea. The parallels between Otto's path to empire and that of Charlemagne are striking. Like Charlemagne, Otto seized the Lombard crown; deposed the king of Italy, Berengar; and was crowned by the pope. And the fundamental continuities went even deeper. Building on the heritage of the eastern Frankish monarchy, Otto and his predecessors had brought Burgundy and Italy once more under royal control, while adding new territories in the east and southeast. Otto's own victory over the Magyars at the Lech in 955 and his establishment of the archbishopric of Magdeburg in 968 were key elements in the development of a strong German monarchy. The emergence of the eastern Frankish or German monarchy in the tenth century overshadowed the continued problems of the western Frankish monarchy under the later Carolingians and the failure of the Capetian house to make good its claim to the western Frankish throne until 987. Once again, imperial ideology went hand in hand with political change. The possession of Italy by the German monarchs served to confirm this reality.

Nineteenth-century German historians, influenced by the nationalist movements of their own day, tended to view Otto's incursion into Italy, and those of subsequent German kings, as a tragic diversion of German

resources into a foreign land. In the view of these historians, the failure of the German monarchy to create a strong national state was directly traceable to this distraction. They did not really appreciate the subordinate role of linguistic and ethnic identities in the making of modern states. They were prone to accept the notion that France, Britain, Spain, and other unified states had a stronger ethnic identity than the German empire, with its numerous ethnic minorities. That such might not be the case seldom entered their minds. In fact, however, both the successes and the failures of the German monarchy between the tenth century and the thirteenth require a radically different explanation. Such an explanation is based on the lack of a royal domain, the inability of the kings to subordinate the aristocracy consistently to royal control, and the failure to develop strong urban support for the monarchy—not on distractions in Italy or even on conflicts with the papacy. Actually, neither of these last two factors had a consistently negative effect on the development of royal or imperial power. Rather, their effect often paralleled that evident within the German territories.

In the tenth and eleventh centuries, the German monarchy continued to experiment with various forms of political control and administration. From the beginning, it was evident that the Carolingian heritage of strong ducal and comital rule on the eastern frontier created a problem for the monarchy. In the early tenth century, Conrad of Franconia (Conrad I), the first king not of the Carolingian line, had realized that only the most powerful dukes had any chance of effective royal rule and recommended that he be succeeded by Henry, duke of Saxony. The wisdom of this decision was amply demonstrated by Henry's son Otto I, but his successors ran into serious difficulties. The ambitious policies of Otto II, which brought Poland into closer relationship with the empire, foundered in his efforts to counter Muslim expansion in southern Italy. The long minority of Otto III, who was a child of three at his accession in 983, and his early death in 1002, served chiefly to demonstrate the strength of the work of Otto I. Although not lacking in ability, Otto III mainly had to pursue policies set forth by his clerical advisers, many of whom were deeply influenced by the ideology of Roman renewal. Among these, Gerbert of Aurillac, who became Pope Sylvester II in 999, stands out as one of the most learned

figures of the age. His choice of the name Sylvester—that of the pope who had reigned at the time of Constantine's conversion and who was the central figure in the medieval forgery called the Donation of Constantine—speaks volumes about the ideology current at the court of Otto III.

The premature death of Otto III had a particular impact on Italy, where he and his advisers had enforced tighter control over the central and northern regions. The successor of Otto III, Henry II, shifted attention away from Italy toward Germany and the Slavic lands, where he initiated a strong political recovery and promoted ecclesiastical reforms. Henry's reputation for personal holiness led to his canonization. His saintly wife, Cuna gunde, joined him in endowing monasteries and convents and promoting missionary activities. On Henry's recommendation, the duke of Franconia, Conrad, was chosen as his successor, becoming Conrad II. Conrad II, a direct descendant of Otto II through the female lineage, was the first of the Salian line. Like Henry II, he devoted more attention to his northern lands than to Italy, chiefly because he was attempting to increase royal authority at the expense of the dukes. Under Conrad II and his immediate successors, the monarchy also began to employ the upper class of the servile population, the later "ministerials," as administrators in an attempt to enlarge the royal domain without alienating lands to the great nobles and churchmen of the realm. In this effort, the kings found themselves in competition with the nobles, who had territorial ambitions of their own. Although the process in Germany had very distinctive features, its impact was similar to contemporary movements elsewhere in the west, where powerful lords were aggrandizing themselves at the expense of others. Whether we think in terms of kings, nobles, the clergy, or even incipient urban powers, the eleventh century was marked by an intensification of efforts to consolidate lands, rights, and jurisdictions. These conflicts contributed substantially to the violence of the age and called forth movements, such as the "peace of God" and the "truce of God," which opposed the forces of destruction. The monastic reform movement of the tenth and eleventh centuries had identified closely with great noble and royal patrons. Even Cluny, founded in 910, and subject directly to Saint Peter, found such support necessary and advantageous. The leading Italian monastic reformer of the eleventh

century, Saint Peter Darnian, was much influenced by these currents, enjoyed good relations with the court of Henry III, and identified with the reforms sponsored by the imperial court, including the reform of the papacy, which saw the election of a succession of German reformers as popes.

Increasingly, conflict over rights and jurisdictions involved the papacy. Papal reformers took a more active role in spreading ideas of reform through councils and synods. A major concern was the involvement of the laity in the administration of ecclesiastical property and in the selection of candidates for clerical office. The reformers demanded elections free of external influence. Under Pope Gregory VII, clerical rights were vigorously asserted in *Dictatus papae* (1075). During this same period, Gregory became embroiled in a conflict with the young Henry IV over the election of the archbishop of Milan. The resultant turmoil brought to the surface internal problems in the relationship between ecclesiastical and temporal authority—problems that had previously been submerged by the close cooperation which characterized these relations in most instances. Clerics feared the dominance of the laity and its threat to the freedom of the church; this fear became a central theme and found concrete expression in the dispute over lay investiture, that is, the investing of clerical officials, especially bishops, with the symbols of their office by the temporal authorities. Although this conflict was eventually settled by compromise in the so-called Concordat of Worms of 1122, it had exposed a fault line in medieval society and resulted in a serious fracture. Once aroused, the clergy's fear of lay dominance could not easily be assuaged, and the grievances of temporal rulers and their supporters against those whom they perceived as disturbers of the traditional order rankled deeply.

The internal divisions created by the investiture conflict persisted in imperial politics even after the settlement at Worms. The election of Lothair II brought to the throne an opponent of Emperor Henry V. Henry V had attempted to achieve the goals of his father but had eventually been forced to compromise. Those who were dissatisfied with Lothair's election included Frederick of Swabia and his brother, Conrad of Franconia, of the house of Hohenstaufen, who had been strong supporters and close relatives of Henry V. Following the death of

Lothair (1137), the nobility elected Conrad (as Conrad III), but he proved unable to heal the breach. Conrad's leadership of the German contingent in the Second Crusade reveals his policy of restoring harmony among the leading factions; however, his opponents—led by Henry the Proud, duke of Saxony and Bavaria—remained intransigent. The choice of Conrad's nephew Frederick of Swabia as his successor made it evident that the majority of the electors wanted to heal the rift, since Frederick had family ties to the supporters of Henry the Proud. Frederick, who thus became Frederick I and was known as Barbarossa (red-beard), directed his energies toward rebuilding the German monarchy. In Germany, he allowed Henry the Lion to succeed to both Saxony and Bavaria, in the hope of gaining Henry's support. On the other hand, Frederick asserted royal rights wherever there was legal justification. Munz (1969) viewed Frederick's reign as a series of plans for laying a solid foundation for the German monarchy. Though overly schematic, this view has merit. The perennial difficulties of the German kings resulting from their lack of a sufficient base for their power were especially serious for Frederick I and forced him to pursue aggressive policies to remedy this defect. Assertion of imperial rights in Italy was therefore a very practical objective, not the ideological chimera older historians made of it.

Perhaps too much has been made of such incidents as Frederick's refusal, at the time of his imperial coronation, to do homage to the pope (Frederick would not hold the bridle of the pope's horse and would not help the pope dismount), and the confusion over the use of the term *beneficia* by a papal legate at Besan[^]on, which seemed to imply that Frederick owed his kingdom to the papacy. These episodes show that Frederick was prickly with regard to his rights and that his officials shared his distrust, but they hardly augur the disputes that occurred in the 1160s. Those disputes resulted from Frederick's effort to secure recognition of his imperial rights and jurisdictions, with the attendant fiscal prerogatives, throughout the kingdom of Italy. The Diet of Roncaglia in 1158 had secured for Frederick virtually everything he sought, but it also provided a rallying point for his opponents in northern Italy. The disputed papal election of 1159, in which Frederick intervened, resulted in a schism. Frederick supported Victor IV and, following Victor's death, Pascal III, against Alexander III, who gained

support in France and elsewhere. Alexander's support of the Lombard League, formed in 1167 by Milan and its allies, forced Frederick to return to Italy in 1174. There he met a decisive defeat in the battle of Legnano in 1176. Despite this setback, Frederick was able to conclude a peace agreement with Alexander III in 1177 in Venice that enabled him to pursue more protracted negotiations with the Lombard League. He concluded a treaty with King William II of Sicily, which provided for a marriage between William's heiress Constance and Frederick's son Henry. The marriage took place in 1186. Before that, however, Frederick had reached an agreement with the Lombards (1183). He did not entirely abandon his Italian policy, but he tailored it to fit political realities. After Saladin conquered Jerusalem in 1187, the pope called for a crusade. Frederick responded, but he drowned while swimming in the Saleph River in Asia Minor.

Under Frederick, it had become usual to refer to the empire as *sacrum imperium*. This notion of a sacred or holy empire was politically juxtaposed to the papacy and emphasized the divine origin of royal and imperial power. Frederick also drew on a revived study of Roman law to reinforce his views of imperial authority. Ideas such as these also reflected the enhancement of Frederick's own position and the ambitions that impelled him. His dreams were shared by his son, Henry VI. The reign of Henry VI was especially significant for Italy, since he laid claim to the kingdom of Sicily on behalf of his wife after the death of William II in 1189. In 1194, he was successful in securing the Sicilian crown for himself and his heir, the infant Frederick Roger. After Henry VI died in 1197, the independent rule of Constance was aimed mostly at ensuring the succession of Frederick Roger; to that end, she entrusted the child's guardianship to Pope Innocent III before her death in 1198.

The death of Henry VI threw the empire into chaos. In a disputed election, one faction selected Henry's brother, Philip of Swabia, while the other elected Otto of Brunswick, the son of Frederick Barbarossa's old nemesis Henry the Lion. Innocent III attempted to protect the interests of Frederick Roger in Sicily against German forces led by the ministerial of Henry VI, Mark-ward of Anweiler. At the same time, Innocent pursued a somewhat ambivalent policy, preserving for a while a semblance of neutrality but tending to favor Otto of Brunswick. Philip of Swabia was assassinated in 1208, just as Innocent was about to

switch his support from Otto to Philip; and Otto invaded Italy and the kingdom of Sicily. These events drew Innocent into an alliance with Philip Augustus of France to put the young Frederick Roger on the German throne as Frederick II.

Under Frederick II the empire reached its zenith, but its internal weaknesses and the failure of Frederick's Italian policy to remedy these weaknesses finally led to disaster. Although the conflict between the empire and the papacy has long dominated writing about Frederick II, there is ample evidence that both sides worked hard to settle outstanding differences and to promote peaceful solutions. Under popes Innocent III and Honorius III, relations were usually good, though there was some friction over Frederick's delays in fulfilling his vow to go on a crusade. There was also friction over the situation of the church in Sicily, as Frederick attempted to reassert his royal authority in the kingdom after his return from Germany in 1220 and his repression of revolts by nobles on the mainland and Muslims in Sicily. Certainly, the accession of Pope Gregory IX and Frederick's decision to go on a crusade even though he was excommunicated contributed to an atmosphere of increasing mistrust; but not even the fiasco of the papal invasion of the kingdom in 1229 totally destroyed the cooperative relationship that had been forged under Honorius III. The treaty of Ceprano (1230) secured the cooperation of the papacy in Frederick's efforts to reassert imperial rights in northern Italy. Still, the atmosphere was scarcely favorable. Fear of Frederick's position in the kingdom of Sicily was a strong element in the opposition to his policies within the papal curia. In Germany, his own son, Henry, attempted to impose more effective royal control in a way that threatened Frederick's position in both Italy and Germany. By the end of the decade, all efforts at cooperation had given way to the revived Lombard League and to open warfare. Pope Innocent IV led a determined opposition to Frederick's Italian policies. Frederick, who had already been excommunicated by Gregory IX in 1239, was again condemned at the Council of Lyon in 1245. Frederick suffered a major defeat at Parma in 1248 and died in 1250. His son Henry had died in his father's prison. Frederick was succeeded by another son, Conrad IV. In the kingdom of Sicily, Frederick's illegitimate son Manfred supported Conrad's effort to maintain their father's Italian possessions. Opposition by the papacy led

to an invasion of the kingdom by Charles I of Anjou, the brother of King Louis IX of France; Charles assumed the crown of Sicily following the death of Manfred. Northern Italy now totally escaped imperial control. The northern communes were virtually unfettered to pursue their own expansionist policies or to form protective alliances against their predatory neighbors. Though the imperial presence had generally made only a small difference to these goals, that barrier was now removed. Some efforts were made to revive a measure of imperial jurisdiction in the fourteenth and fifteenth centuries but found no real success.

The most notable involvement of the empire in Italy was an invasion led by Henry VII of Luxembourg, to whom Dante directed appeals against the dominant Black Guelf Party in Florence. But Henry's expedition proved evanescent. During the fourteenth and fifteenth centuries, the German monarchy was seldom able to mount even a coronation expedition into Italy. This was the period of internal transformation of the empire, the emergence of the princely territorial states, and the beginnings of the Hapsburgs' dominance. Lewis IV and Charles IV began a process that ended any role of the papacy in the making of an emperor. Among those who sought refuge at the court of Lewis the Bavarian was Marsilius of Padua, an extreme critic of the papacy and an exponent of communal liberties. But Charles IV pursued more moderate positions, remaining largely on good terms with the papacy and promoting the interests of the Bohemian church. His promulgation of the "golden bull" (1356) provided constitutional recognition for the direction taken by the empire since the mid-thirteenth century. It vested control of imperial elections in the German princes. The late fifteenth century saw a continued emphasis on the development of princely states in Germany and a parallel development of princely and oligarchic government in northern Italy. The Hapsburgs not only gained control of the imperial title but set about building their own state in southern and southeastern Europe. When an emperor again came to Rome at the head of an army, it was not in quest of imperial coronation but in pursuit of the interests of the Hapsburg dynasty in Italy, a goal far removed from that of the medieval emperors but one that reflected the changing nature of the empire.

Homer

During antiquity, a number of archaic or otherwise early poems in Greek circulated under the name of Homer. These included the heroic epics *Iliad* and *Odyssey*, the epic burlesque *Batrachomyomachia* (*Battle of Frogs and Mice*), hymns, epigrams, and the now lost comic narrative *Margites*. They were accepted as the work of a single person who had lived in Greek-speaking Asia Minor, were considered classics of Greek literature, and as such were read in Italy by educated Romans of the late republic and early empire. Both Greeks and Latin-speaking Romans considered Homer a master of high epic style and, as the poet Ovid put it (*Amores* 3.9, 25–26), a perennial spring for other bards to drink from. Enshrined in Greek culture and often referred to simply as "the poet," Homer was taught in schools at several levels. Brief, necessarily fictional biographies presented him as both a literary author and a sage; and his own claims of divine inspiration encouraged others, especially pagan philosophers, to treat his writings as a source of revealed wisdom allegorically expressed.

But Homer's image was not always positive. As the author of the dominant extended works of fiction dealing with the Trojan war and with some of its sequelae, he was denigrated by those who departed from convention in order to present "truer" versions of these legendary events. Two examples that were influential in the medieval period are Isidore of Seville's summary (*Etymologiae*, 8.8.4) of a prophecy of the Erythrean sibyl, seemingly different from later texts of this name, which has her predicting Homer's lies; and a prefatory letter to the rationalizing narrative of "Dares Phrygius" which calls Homer untruthful and says that the Athenians had judged him insane for

having written of gods fighting with mortals. Some Christian educators found Homer's polytheism troubling in general. By the end of antiquity, Homer was still in the Greek curriculum, but relatively few people were reading his works in full. To the non-Greek majority in Italy, he was now a closed book, although the very few who still learned Greek could encounter him in excerpts (as Boethius is thought to have done).

What little most medieval Latin- or Italian-speaking Italians knew of Homer (if they knew anything at all) came directly or indirectly from scattered references, usually no more than brief mentions, in earlier texts representing one or more aspects of the ancient tradition outlined above. Those who did not read poets may not always have known that Homer had been one. The chief sources for factual information about the content of Homer's poems were isolated remarks by philosophers and theologians of the late antique period and ancient commentaries on a few classical Latin poets, especially Vergil, whose use of Homeric material had called for or at least prompted explanation. Additionally, there was a brief condensation (less than 1,100 lines) of the *Iliad* in Latin verse, dating from the first century after Christ; this was locally available in some parts of Italy from probably the late ninth century onward. It is now known as the *Ilias Latina*, but for most of the Middle Ages it was called the "book of Homer the poet" or just "Homer." This very inadequate substitute is thought to have influenced the wording of tenth- and twelfth-century epic poems in Latin from northern Italy and from Pisa and to have informed an eleventh-century lament for Hector (also in Latin), seemingly from Rome. The *Ilias Latina* was copied in Campania perhaps as early as the tenth century; and in the eleventh century it was certainly at Monte Cassino and was also copied in central Italy, possibly at Farfa. In the fourteenth century, it was known to the northern Italian encyclopedic writer Benzo of Alessandria and to the Tuscans Petrarch and Salutati,

Homer survived in the medieval Arab world in much the same shadowy way as in the post-antique Latin west. Educated Italians of Arabic culture would have known extremely little of him. But among Greek-speaking Italians there was continued direct contact with his writings, though for a long time no complete texts seem to have been available. Our deposit of Homeric manuscripts from medieval Italy begins in the tenth century and so is silent on the Greek cities of pre-

Arab Sicily. Until the thirteenth century it consists of selections, summaries, collections of grammatical and explanatory notes (including the so called D scholia to the *Iliad*), glossaries, and similar educational aids. Material of this sort, along with quotations transmitted in the works of patristic or other ancient authors or in *florilegia* (collections of extracts) drawing on these, furnished the limited Homeric reading of even such literary craftsmen as Philagathus of Cerami and Eugenius of Palermo. Advanced offerings could include sizable amounts of continuous text: two selections from the Norman period or the very early Swabian period include several whole books of the *Iliad* or *Odyssey* (each of which has twenty-four of these internal units); and a tenth-century manuscript (now in Paris, *Par. Suppl. Gr.* 388) contains Colluthus's late antique Homeric "prequel" *The Theft of Helen* (a brief epic whose medieval manuscript tradition is entirely Italo-Greek) and a 1,943-line amalgam of Homeric centones (poems made up of lines from Homer).

During the twelfth century, though, the work of John Tzetzes and other scholars of the eastern Roman (Byzantine) empire promoted a broader study of ancient Greek literature, including the Homeric epics in full. By the beginning of the thirteenth century, these had begun to reach the Salentine peninsula in Italy. The *Odyssey* and the *Batrachomyomachia* were transcribed in 1201 by students of the first well-known Nicholas of Otranto, the future Nectarius of Casole (their manuscript is now at Heidelberg, *Palat. Gr.* 45). The imperial notary John of Otranto (Johannes Grassus), some of whose poems reveal familiarity with minutiae of Homeric style, possessed an *Odyssey* that he lent in 1230-1231 to George Bardanes, the metropolitan of Corfu. Grammatical notes by Nicholas of Otranto (it is unclear which one) preserved in the southern Italian portion of a composite thirteenth-century manuscript (now at Oxford, New College, MS 298) show that the entire *Iliad* was available as well. Paleographers now assign to the Salento several thirteenth- and fourteenth-century manuscripts of this poem. A well-known thirteenth-century *Odyssey* with scholia (London, *Harl.* 5674) is also considered Italo-Greek but could be Siculo-Calabrian rather than Salentine in origin. Another manuscript of the *Odyssey* (now in Vienna, *Vindob. Phil. Gr.* 56) was copied by a Salentine scribe in 1300 and is thought to have been in Greek-speaking Calabria in the

mid-fourteenth century.

Ancient Greek poems that took Homer's narratives of Troy as a point of departure were also part of this expanded canon. Lycophron's *Alexandra*—which was (like the *Prophecy of the Erythrean Sibyl*) a prophetic text with a Trojan setting and (like the *Odyssey*) a poem of mythological content including southern Italy in its purview—circulated widely in the Salento. At least four of its surviving thirteenth- and fourteenth-century manuscripts were written there; and a contemporary library inventory from Aradeo or its vicinity records a copy in a volume, now lost, that also contained the *Works and Days* of the early poet Hesiod. Supplementary narratives in the Homeric mold were available to extend the story of the *Iliad* backward or forward in time to cover important parts of the received tradition: Colluthus again; the lengthy *Posthomerica* of Quintus of Smyrna; and brief epic poem, *The Taking of Troy*, by Triphiodorus (or Tryphiodorus). Indeed, it is to the Greek libraries of the Salentine peninsula that we owe Quintus's survival, as well as one branch each of the textual traditions of both Colluthus and Triphiodorus. From the Salento, too, may come our only complete separate witnesses for the shorter form of the late antique Christian *Homerocentones* (Homeric centos) transmitted under the names of Patricius and the empress Eudocia.

In the thirteenth and early fourteenth centuries, few other Italians would have had access to such riches. Though Dante enrolls himself in a society of poets under Homer's rule (*Inferno*, 4.70–102), his ignorance of the Homeric poems is palpable. A concise distillation of what little was known about them occurs in the anonymous *De vita et moribus philosophorum* (*Lives of the Philosophers*), formerly ascribed to the Englishman Walter Burley and now believed to have been written in northern Italy during the years 1317–1320. A similar but more fulsome treatment may be found in the closely contemporary Book 24 (*De moribus et vita philosophorum*) of the *Chronicle* of Benzo of Alessandria. These scholarly works offer biographical details that were traditional but false as well as some account of Homer's reported preeminence as a poet and as a philosopher. Drawing on the commentary on Jerome's prologues by Guillelmus Brito, a thirteenth-century Parisian master famous for his study of Greek words (and learned enough to have been aware of the Christian Homeric centones),

Benzo and the pseudo-Burley each give the meter and the number of books of both the *Iliad* and the *Odyssey* and also capsule descriptions of their subject matter. The account of the *Odyssey*—"the wanderings of Ulysses"—is reasonably accurate; but that for the *Iliad*—"the taking of Troy"—is less so, as the narrative of the *Iliad* ends well before this event. These meager data recur in *De viris illustribus* (*On Famous Men*, mid-fourteenth century) by Petrarch's friend and correspondent William of Pastrengo.

The recovery of the Homeric poems for the Latin west was an undertaking of the early humanists Petrarch and Boccaccio and of their Italo-Greek collaborator Leontius Pilatus, a wandering scholar from Calabria active in northern Italy. Petrarch, who was eager to inform himself about ancient Greek literature, received in 1354-1355 as a gift from the eastern Roman diplomat Nicholas Sigerus a Greek-language manuscript of the *Iliad* (now in Milan, *Ambros. Gr.* I 98 inf.), which to his sorrow he could not read. In 1359, Leontius translated part of the poem into Latin prose for Petrarch. Boccaccio got Leontius a position at the university of Florence, and in the early 1360s Leontius produced complete interlinear translations of the *Iliad* and the *Odyssey*, also in Latin prose (his revised autographs are Venice, *Marc. Gr.* IX 2 and IX 29, respectively). Petrarch's letter to a Active Homer (*Familiarum rerum libri epistole*, 24.12), written after receipt of the initial partial translation, and Boccaccio's somewhat later account of the bard in his commentary on Dante's *Commedia* are heavily indebted to ancient biographical fiction and to other schoolbook information furnished by Leontius. Although Boccaccio could name and describe the *Batrachomyomachia*, and although the *Iliad* is now more correctly summarized, both his richly detailed portrait and that emerging from Petrarch's letter say little of substance about the poems themselves. Significant critical engagement with these would be the work of others.

Homer with the other ancient poets in Limbo. Dante's *Inferno*. *Opere del diuino poeta Danthe con suoi commenti*. Venice: Bernardino Stagnino, 1512.

Honorio

The strong-willed Justa Grata Honorio (c. 416 or 417-c. 455) was the daughter of the future emperor Constantius III (r. 421) and Galla Placidia, and the elder sister of the emperor Valentinian III (r. 425-455). Honorio held the title *augusta* ("empress"). At the orders of her brother, she was devoted to virginity, a situation she did not find to her liking. Around 449, she was apprehended in a love affair with the overseer of her estates; both were also supposedly engaged in a plot to seize power for Honorio. As a result, her lover was executed and she was exiled to Constantinople. She then appealed for help to Attila the Hun, whereupon the eastern emperor Theodosius II, who already had enough problems with the Huns, immediately dispatched her back to Italy—with the recommendation that Valentinian turn her over to Attila. Valentinian was enraged, and he spared her life only because of the earnest entreaties of their mother. Honorio was then compelled to marry a reliable senator named Flavius Bassus Herculanus, and subsequently she was kept under close guard. Attila, meanwhile, chose to interpret Honorio's missive as a marriage proposal and demanded half of the western Roman empire as her dowry. Attila's ultimatum was refused, and he responded by invading the western empire in 451 and 452. Honorio's ultimate fate is unknown; she may have been dead by 455.

Honorius, Emperor

Flavius Honorius (384-423, r. 395-423) was born in the east, the younger son of the emperor Theodosius I (r. 379—395) and Aelia Flavia Flaccilla. In his youth, Honorius was called *nobilissimus puer* ("most noble child"), and in 386 he held the consulate. He was summoned by his father to Rome when he was five, but in 391 they both returned to Constantinople; there, in 393, Honorius was proclaimed emperor. In 394, he was called to Milan, and in 395, when Theodosius died, Honorius and his brother Arcadius jointly succeeded to the throne, with Arcadius ruling the east and Honorius the west. This year marked the beginning of the true de facto division of the empire into eastern and western halves, each under the rule of its own emperor, even though, in theory, the empire remained a single entity. Both boys spent their reigns under the influence of powerful advisers. The first such power behind the throne in the west was the Vandal general Stilicho, both of whose daughters Honorius married—Maria c. 398 and Thermantia in 408.

After the Visigoths invaded Italy in 402, Honorius and the imperial court retired from Milan to Ravenna, which was less accessible and was heavily defended. Only rarely did later emperors reside for any length of time elsewhere. Meanwhile, palace intrigues resulted in Stilicho's assassination in 408, and Honorius was left to deal with Alaric and the Visigoths. The indecisive emperor, influenced first by one adviser and then by another, vacillated between resistance and conciliation. The end result was the sack of Rome in 410.

The Visigoths were not the only barbarian invaders of the western

empire during Honorius's reign. In 405, the barbarian adventurer Radagaisus assembled a huge army in the Danubian region, invaded Italy, and ruined many Italian cities. Not until August 406 were he and his army destroyed by Stilicho. On the last day of 406, hordes of Burgundians, Alans, Suevi, and Vandals crossed the frozen Rhine into Gaul and began slowly making their way south. In 409, all but the Burgundians crossed into Spain. In northeastern Gaul, the Franks extended their influence, and in 418, the Visigoths were granted a treaty that assigned to them much of southwestern Gaul. Gradually, therefore, more and more of the western empire was slipping from Roman hands.

Honorius's reign was also afflicted by several revolts and usurpations. In 397, the master of soldiers Gildo revolted in North Africa, though he was suppressed in 398. In Britain, a succession of rebellions by the discontented and isolated soldiery included those of Marcus (406-407), Gratian (407), and Constantine III (407-411). In 407, Constantine crossed to Gaul and successfully advanced all the way to Aries. Meanwhile, in 409, the senator Priscus Attalus was proclaimed emperor, although he was deposed when Alaric and Honorius made a short-lived peace in the next year. At the same time, Constantine's general Gerontius rebelled in Spain, and in 409, he elevated a certain Maximus to the purple. Honorius, for his part, sent his general Constantius to deal with the situation in Gaul in 411. The resultant falls of Constantine and Maximus, however, were followed by a revolt in northern Gaul by Jovinus, which was not suppressed until 413. The powerful general Constantius then married Honorius's sister Galla Placidia in 417 and was promoted to coemperor with Honorius in 421, only to die of illness later in the year. In 420, the "tyrant" Maximus—perhaps the same man as the Maximus mentioned above—seized power in Spain; he was not subdued until 422.

The feckless, timid Honorius generally took little part in public affairs. He was passive by nature, except when he was motivated to act out of fear. He left military operations to his generals, but he did become involved in a controversy over the choice of a bishop of Rome in 418. He eventually died of "dropsy"—perhaps edema of the lungs—in 423. He left no issue; this situation resulted in the proclamation of Johannes, the chief secretary, after his death. Not until 425 did his nephew Valentinian III, the son of Galla Placidia and Constantius,

restore the legitimate dynasty.

The unity of the western empire was shakily maintained during Honorius's reign—only Britain was lost for good (Honorius wrote to the Britons advising them to defend themselves). But he left a legacy of fragmentation and feeble, lackluster leadership which eventually would result in the dissolution of the western empire.

For legislation issued by Honorius, see the relevant entries in *Codex Theodosianus* and *Codex Justinianus*-, for Honorius's extant correspondence, see Guenther (1895).

Honorius II, Pope

Pope Honorius II (Lambert Scannabecchi; d. 1130, r. 1124-1130) had entered the papal service in the late eleventh century and had risen to become the cardinal bishop of Ostia in 1117. He had been an outstanding diplomat and was one of three papal representatives who negotiated the Concordat of Worms (1122). When Pope Calixtus II died in 1124, the rivalry between two Roman families, the Frangipani and Pierleoni, intruded in the election of a new pope because factions within the College of Cardinals supported each family. After several tumultuous days in Rome, during which there was fighting between the two families and their cardinals, the Frangipani candidate, Lambert Scannabecchi, finally emerged as Pope Honorius II.

During his tenure, Honorius tried to defend the interests of the church in Italy. He pacified the restless nobility in the papal lands of central Italy and compelled other nobles, south of Rome, to become vassals of Saint Peter. The major challenge to the papacy in Italy, however, was from Roger II, the Norman ruler of Sicily. In 1127, Roger seized the duchy of Apulia, on the basis of a hereditary right; but Honorius claimed the conflicting right to name a new duke, on the basis of his own feudal right as overlord of Apulia. Honorius nevertheless had to invest Roger with Apulia, in the treaty of Benevento (22 August 1128), because the papacy could not dislodge him militarily; and the situation stayed this way until Honorius's death.

Honorius III, Pope

Pope Honorius III (Cencio Savelli; d. 1227, r. 18 June 1216— 18 March 1227) was born in Rome before the mid-twelfth century, was educated in the Lateran, became canon of Saint Mary Major, and was appointed chamberlain of the Holy See under popes Clement III and Celestine III. Honorius became cardinal deacon of Saint Lucy in Selci and later cardinal priest of Saints John and Paul. While serving as treasurer, he used his impressive administrative skills to publish *Liber censuum*, a complete and orderly list of the citizenry's pecuniary obligations to the Holy See. In the same manuscript he added a copy of *Marvels of the City of Rome* (*Mirabilia urbis Romae*) and a chronicle of Roman popes going back to Saint Peter. This book remained in use until the sixteenth century.

Probably as a consequence of his long stay at the papal court before being elected to the papacy, Honorius followed faithfully in the steps of his predecessor, Pope Innocent III. He continued most of Innocent's policies, dedicating himself to the recovery of the kingdom of Jerusalem, the elimination of heresy, and the support of the new mendicant orders—the Dominicans and Franciscans.

Honorius's pontificate was marked by the struggle between pope and emperor. Frederick II was determined to transform the empire into a hereditary institution and to combine the imperial crown with the

Sicilian kingdom; these goals clashed with the papal view of the empire as elective and of Sicily as a papal fief. Frederick had vowed to lead a new crusade that would be a truly religious endeavor, without the political and mercantile elements of the previous crusades; and after the failure of the Fifth Crusade the pope insistently reminded him of this vow. However, Frederick failed to honor his commitment during Honorius's pontificate. Honorius also used his diplomatic skills in an attempt to establish peace between England and France.

Honorius took a tolerant attitude toward Muslims but strongly fought and repressed Christian heresies. He was particularly belligerent against the Albigensians. He continued the crusade against them begun by his predecessor and entrusted the Dominican order, which had recently been founded and approved, with the task of preaching against Albigensian doctrines.

Honorius was responsible for the establishment of the two mendicant orders—a crucial step in the history of the church—and he fostered their spread in every possible way. He solemnly confirmed the rule of Saint Francis, thanks to the intercession of Cardinal L'Jgolino (Hugolino) of Ostia, the future Pope Gregory IX; Honorius also gave formal confirmation to the rule of Saint Dominic in 1216,

Honorius had become pope at an advanced age, and it was a struggle for him to follow in the footsteps of his energetic predecessor. Although Honorius was not a pope memorable for originality or genius, he was deservedly renowned for his generosity and holiness.

Honorius IV, Pope

Pope Honorius IV (Giacomo or Jacobus Savelli; c. 1210-1287, r. 1285-1287) Had been cardinal deacon of Santa Maria in Cosmedin and papal prefect in Tuscany. He was among the cardinals deputed by Pope Urban IV to invest Charles of Anjou with the kingdom of Sicily (1265). Both of Honorius's brothers fought for Charles at Tagliacozzo and one, Pandolfo, was joint senator of Rome when Honorius became pope. Honorius was so crippled that he could not walk and perhaps could not even lift his hands.

Pope Honorius IV. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*). Nuremberg: Anton Koberger, 1493, p. 217v.

As overlord of the Regno, Honorius IV in 1285 promulgated the

"constitution of Sicily" in two bulls. One bull dealt with relations between the royal officers and the church; the other proclaimed a return to the laws of the last effective Norman king, William, particularly in reducing the general subvention to an annual maximum of 50,000 *uncie* and defining more precisely when it might be raised. Further reforms included reducing obligatory services from the communes, and levies in kind; and new measures to deal with official corruption. The nobles acquired some new rights—these included the freedom to marry without reference to the king, permission for women and collaterals to inherit, and restrictions on military service. The constitution was never fully enforced, but some of its clauses were temporarily effective.

Honorius remained unyieldingly opposed to the Aragonese in Sicily, refusing to recognize the pretensions of James, second son of Peter III, who succeeded in Sicily in 1283 and was crowned in defiance of Honorius in 1286. Despite James's offer of homage, Honorius excommunicated him and his supporters and laid an interdict on Sicily. Honorius also continued—even after the French failed in 1285 to set Charles of Valois on the throne of Aragon—to insist on the validity of a so-called crusade to oust Alfonso II in Aragon and James in Sicily, conceding substantial sums to the regents of Angevin Sicily to support it. Honorius prolonged both the war and Charles's captivity by rejecting the first treaty made by Charles II with Alfonso, which recognized not only Alfonso's claim to Aragon but that of James to Sicily and southern Calabria, thereby ultimately saving Calabria for the Angevins.

Elsewhere in Italy, Honorius made little impact, though he secured the submission of Guido da Montefeltro in the Romagna and ended a quarrel with Venice over its failure to support the Angevin cause.

Horace

Quintus Horatius Flaccus (65-8 B.C.) was born in Venosa, a Roman military colony. Despite a modest background, Horace received an excellent education in Rome. During the civil war, Horace fought with Brutus, but the republicans' defeat at Philippi in 42 interrupted his military career. In 38, the influential Maecenas became Horace's patron; and in 33, with Maecenas's gift of a farm in Sabine country, Horace retired from city life and devoted himself to literary pursuits.

Horace's works consist of four collections. The *Epodes* (30 B.C.) seventeen short poems, primarily in iambic couplets, address a variety of topics. The *Satires*, or *Sermones* (35-30 B.C.), eighteen poems in hexameters, also cover a range of subjects. The *Odes*, or *Carmina* (23 B.C.), consist of eighty-eight lyric poems. Finally, the *Epistles*, twenty-three poems in hexameters, were published in two books, the first (containing twenty letters) in 20 B.C. and the second (containing three letters) perhaps posthumously. The best-known letter is *The Epistle to the Pisos*, which is often included in the second book. Known as *Ars poetica*, it sets forth theories on poetry and drama.

In the Middle Ages, Horace was an important school author whose work was excerpted frequently and widely disseminated. Until the fourteenth century, however, he was better known for his *Satires* and *Epistles* than for his lyrics. The morality found in the *Satires* and *Epistles* could be molded to suit the needs of a Christian readership, but the *Odes* and *Epodes* were more difficult metrically and less adaptable to religious and ethical uses.

Dante includes Horace in the *bella scola* of eminent poets in *Inferno* (4.89), where he is called *Orazio satiro* ("Horace the satirist"). In all

likelihood, Dante did not know Horace's *Odes*, but throughout his works he demonstrates familiarity with several of the epistles, most prominently *Ars poetica*. For example, the analogy Adam makes in *Paradiso* (26.137-138) between the transience of human speech and the natural life cycle of leaves is evidently modeled on a similar discussion in *Ars poetica* (60-63), which finds its way into Dante's *Convivio* as well (2.13.10).

The *Odes* gained popularity during the *Trecento*: the proto-humanist Lovato Lovati and Petrarch both refer to Horace's lyrics. In fact, Petrarch cites Horace's lyric and hexametric poems in equal measure, and in his letter to Horace (*Familiars*, 24.10), Petrarch addresses Horace as the king of lyric poetry.

Hostiensis

Hostiensis was the nickname of Henricus de Segusia, or Henry of Susa (c. 1200-1271), cardinal bishop of Ostia (Hostia), a canon lawyer famous for his commentaries on the *Decretals of Gregory IX*. Hostiensis was born near Turin, studied Roman and canon law at Bologna, and then taught briefly at Paris c. 1239. Most of his career, however, was spent in the practice of law, in which he received lucrative appointments, beginning with the headship of the cathedral chapter of Antibes-Grasse near Nice in 1235. In 1236, he went to England with the new queen, Eleanor of Provence; he remained there until 1242, employed sometimes by the papacy and sometimes by King Henry III, whom he continued to represent as late as 1258. In 1243, Hostiensis returned to Provence to become bishop of Sisteron (and was attached to the papal household as a chaplain). The pope made him archbishop of nearby Embrun in 1250 and often sent him on diplomatic missions. Hostiensis's service to the papacy was amply rewarded in 1262 with the bishopric of Ostia, which made him head of the college of cardinals. The rest of his life was spent working at the papal court, where he died in 1271. He was probably buried at Perugia.

During his thirty-five-year career, Hostiensis wrote two great legal works for which he is famous. The first is his *Summa*, later called the "golden summa" or—because it was completed in 1253, while he was archbishop—the "archbishop's summa." The *Summa* was a new type of commentary on the official collection of papal decisions, or decretals, that gave an overview of each subject division, or title: e.g., all decretals concerning heretics were treated together in a single essay. Though

voluminous (777 folio pages in one printed edition), it was frequently copied; more than 100 manuscripts survive. When this work was done, Hostiensis began another type of commentary on the same text, this time with an essay on each component decretal; he called it *Commentum super decretales*, but it is now better known as *Lectura*. By 1265, he had completed a first version, which he finished revising shortly before his death. *Lectura* (1,472 printed folio pages) is roughly twice as long as *Summa* and hence was reproduced less often, in about fifty manuscripts. Both works were considered indispensable by lawyers for the next 300 years, to the disgust of Dante (*Paradiso*, 12.82-84).

Hostiensis's nonacademic career made him sensitive to the practical everyday needs of the church. Unlike many canonists, he looked to the gospels for his principles, chief of which was to avoid *periculum animae*—anything that might endanger the salvation of the soul. Similarly, he stressed that both the application and the interpretation of canon law should be guided by equity (*aequitas canonica*). Consequently, arguments from Roman law, which were favored by his principal rival, Innocent IV, did not appeal to Henry.

Like other decretalists, Hostiensis was committed to the concept of papal "plenitude of power," which he was the first to describe as a *potestas absoluta*. But he tempered this concept with a characteristic stress on collegiality, arguing that the pope should consult his cardinals and the bishops their chapters. He held that the power of secular government (*imperium*) was derived from the church and was subject to papal interference when sin was involved (*ratione peccati*).

Other canonists also influenced ecclesiastical jurisprudence, but none of them had Hostiensis's distinctive, cultured, and often sympathetic personality. He towered over later generations as the "monarch of legal studies" (*utriusque iuris monarca*). His career exemplifies how Italian-trained jurists dominated European learned law in the thirteenth century.

Hugh of Arles

Hugh of Arles (Hugh of Provence, d. 947 or 948) was king of Provence (928-c. 948) and king of Italy (926-945). He was descended from Charlemagne through his mother. Hugh administered Provence for his cousin, Louis III, becoming king on Louis's death.

Invited into Italy by treacherous nobles in 926, Hugh wrested the Lombard throne from Rudolf II of Burgundy, perhaps also trading Provence for Rudolf's promise never to return to Italy. Hugh's attempted takeover of Rome in 932 angered Alberic, another warlord. Hugh isolated Alberic and regained Provence when Rudolf died in 937, but his power declined thereafter. In 945 Hugh and his son, Lothar, yielded de facto rule to Berengar of Ivrea, grandson of the "emperor" Berengar. Hugh died in Provence.

Hugo, Marquis of Tuscany

Hugo (Ugo, c. 953 or 954–21 December 1001) was the son of Uberto and Willa, daughter of Boniface, duke of Spoleto. At an early age Hugo became involved in the administration of Spoleto and Camerino. He was caught in a conflict among members of diverse dynasties, both local and intrusive: Hugh of Aries, the emperor Conrad II, the Venetian doge Pietro IV Candiano, and the Lombard pretender Berengar II (to the first three of whom he had family connections). In this situation he chose to support the German emperors, perhaps above all Otto III, as the best hope for bringing stability to northern Italy. In this regard he was a firm believer in the superior authority of the office of emperor over the papacy and a staunch supporter of church reform. He is remembered by Dante (*Paradiso*, 16,127–129) as the *gran barone* ("great baron"). Hugo was buried in the Florentine Badia, a church founded by his mother in 978. His prominent tomb was carved by Mino of Fiesole.

Hugo Falcandus

Usually printed under the name of Hugo Falcandus are two important and highly readable Latin prose works having to do with the Sicilian monarchy in the second half of the twelfth century. *Historia* (or *Liber*) *de regno Sicilie* (*History, or Book, of the Kingdom of Sicily*) is a formal historical narration of power struggles and other events during the reign of William I and, with some intervening years not covered,

during the minority of William II. A masterpiece of judgmental incisiveness, it is widely viewed as the preeminent specimen of a rather notable body of Latin-language histories from southern Italy in the medieval period. The briefer *Epistola ad Petrum Panormitane ecclesie thesaurarium de calamitate Sicilie* (*Letter to Peter, Treasurer of the Church at Palermo, about the Sicilian Calamity*) deals with the succession crisis of late 1189 and early 1190 from an antiimperial point of view. Although the two works are transmitted together in our manuscripts, the order in which they appear varies. Scholars differ on whether they are by one author or two, on the precise dating of each work (though they are apparently by an informed contemporary or contemporaries), and on whether *Epistola ad Petrum* was written from within the kingdom of Sicily or outside it.

Equally controversial is the identification of the author— at least of the *Historia* if not of both works. In the surviving manuscripts the author or authors are anonymous; but in 1550 the first editor of the works, using a manuscript that is now lost (or perhaps a lost portion of one we do have), called the author Hugo Falcandus. This designation is now conventional. However, it was possibly derived from a misinterpreted ownership inscription and was thus not an author's name at all, and in any case it is generally thought to be erroneous in some way: the "Falcandus" part is certainly peculiar. Some scholars have taken it to be a pseudonym. The Frenchman Hugues Foucaud or Hugo Fulcaudus, abbot of Saint Denis from 1186 to 1197, has been proposed as an author (and repropounded relatively recently), but this attribution will not satisfy those who believe that there was a single author located in the kingdom of Sicily in early 1190; nor is it established that Hugues actually had substantial experience in Sicily. Other suggestions (e.g., Robert of San Giovanni and Eugenius of Palermo) have not won much support. Arguments based on points of style recur in these debates and underscore the need for a new critical edition: the earliest known evidence (dated to c. 1230) was discovered only after the present edition of reference had been published. One branch of the tradition shows deliberate rewriting in *Historia*.

Both texts are consciously literary; both also manifest very significant emphases and omissions. *Historia* is famous for its brief character sketches as well as for longer portraits of Roger II (favorable)

and of the admiral Maio of Bari, William I's chief minister in the early years of his reign (unfavorable). It provides details of court politics that we would otherwise not possess but that must be read with care in light both of its author's personal biases and of his adherence to patterns established by his ancient stylistic model, the historian Sallust, *Epistola ad Petrum* is a polished and seemingly propagandistic piece of deliberative oratory, noteworthy for its Sicilian patriotism and for its expressions of ethnic and regional prejudice (similar expressions occur in *Historia*). Its concluding praise of Palermo focuses on the city's wealth and splendor and furnishes valuable information on the layout of Palermo in the twelfth century, on the silk weaving practiced there, and on the agriculture of the surrounding plain (now called the Conca d'Oro).

Early humanists were influential in the survival of these works: of the four manuscripts that remain today, one was annotated by the papal secretary Zanobi da Strada and another by Petrarch (extensively) and by Boccaccio.

Humanism and Protohumanism

Humanism encompasses a period of history and civilization lasting roughly three centuries (1300-1600). The opinions of scholars concerning humanism are somewhat varied.

According to one theory—which is considered the oldest and the best-known—humanism was a historical period during which all the values that had been stressed during the Middle Ages were abandoned, and new values came under consideration. During the Middle Ages, ecclesiastical and feudal powers strongly affirmed and defended their authority; during the period of Renaissance humanism, by contrast, the individual would, supposedly, affirm himself and his right to self-determination. Moreover, during the Middle Ages all manifestations of culture (science, art, literature, etc.) had in common a religious interest; but in the period of Renaissance humanism an attempt was made to explore and follow natural principles in ethics, politics, literature, and so on without taking transcendental values into consideration. This theory was supported by J. Michelet, G. Voigt, and J. Burckhardt.

An opposing theory has been proposed by others (K. Burdach, E. Gebhardt, V. Zabughin), who see no separation between the two periods. According to these scholars, a religious interest was also present in Renaissance humanism; and humanistic religious ideals were strongly felt before Renaissance humanism, especially in the twelfth century. Not a few scholars are inclined to see the beginning of humanism in the twelfth century.

Still other scholars tend to be conciliatory. They do not take into consideration what the humanists thought of themselves and who they claimed to be; instead, these scholars derive the humanists' manifold objectives from their works and from the many political transformations occurring during this period. Such an examination has

revealed that in some cases, in some fields, and in the works of some humanists there may be an antithesis between certain ideals and values of the Middle Ages and those of the Renaissance; but it also reveals a continuity between many aspects of medieval civilization and Renaissance civilization.

Some scholars have also considered the economic and social aspects of this subject and have concluded that certain of the most important concepts of the humanists—such as *humanitas*, *dignitas hominis*, and *studia humanitatis*—must have developed in a cultural movement generated by a gradual change in the economic structure which produced a new ideological orientation. The humanists, however, were not aware that a new economic structure in their society was relevant to their new cultural interests and achievements.

Paul O. Kristeller, who has contributed greatly to the historical study of humanism, has proposed defining it according to the way the humanists defined themselves and their work. They considered themselves teachers of the *studia humanitatis*—grammar, rhetoric, poetics, history, and moral philosophy. Their main interest was in acquiring a knowledge of the Latin language and a good style. Their efforts to achieve a good style through the study of classical works had as a consequence an acquaintance with classical culture, which then also influenced their creative works.

Some scholars (H. Baron, E. Garin) have emphasized "civic humanism"—a term indicating the historical situation that arose in the early *Quattrocento* in Florence. In the opinion of these scholars, the humanists would have stressed the importance of civic virtues in public administration and in any activity they had to perform as citizens. Florence was the city where "civic humanism" found its highest expression.

Humanism did not begin abruptly. In the second part of the thirteenth century, in northern Italy, some learned people in Padua had access to the library of Pomposa, which seems to have had a number of texts by classical authors; at about the same time, notaries and jurists in Verona appreciated the importance of the capitular library there. Private libraries came into being in the thirteenth century, and private possession of books might explain the interest of the owners in works and authors present in their libraries. The first humanists improved

their knowledge of the Latin language and were able to revive the works of poets, such as Catullus, who had previously been ignored. Jurists and notaries played a leading role in early humanism, probably because they had to be familiar with Roman laws and institutions. Lovato Lovati (1240-1309), Geremia da Montagnone, and Rolando da Piazzola were judges, and Albertino Mussato was a notary; all were active in Padua. Benzo d'Alessandria (a notary) and Guglielmo da Pastrengo (a jurist) lived in Verona; other jurists and canonists were active in Bologna, Florence, and Naples. Lovato dei Lovati studied the metrical structure of Seneca's tragedies. Giovanni da Matociis (Mansionario, Iohannes de Matociis) proved, in the first years of the fourteenth century, that the Pliny who wrote *Historia naturalis* could not have been same Pliny who wrote the letters; in two manuscripts of Giovanni's *Historia imperialis* a note was discovered (relatively recently) revealing the titles of some of Ausonius's works that had previously been unknown. Giovanni was also interested in Roman coins. Albertino Mussato (1261-1329) wrote a tragedy (*Ecerinis*) modeled on Seneca, even in its metrical structure; evidently, Albertino's intention was to revive classical theater. Because of the activity of these humanists, we must admit that humanism existed in Italy before Petrarch and Boccaccio.

Humbert of Silva Candida

Humbert (d. 5 May 1061) was probably born in Burgundy. He was given by his parents as an oblate to the reformed Lotharingian monastery of

Moyenmoutier, in the diocese of Toul. As a young monk he devoted himself particularly to study (c. 1015-1029), acquiring an astonishing range of knowledge. He attracted the attention of his diocesan bishop, Bruno of Toul, who became Pope Leo IX (r. 1049-1054) and included Humbert in his entourage when he took up his pontificate in Rome. Humbert became a leading adviser not only of Leo IX but also of popes Victor II, Stephen IX, and Nicholas II. Humbert was named archbishop of Sicily as early as 1050, and he became one of the first non-Roman members of the evolving College of Cardinals as cardinal bishop of Silva Candida. Pope Stephen IX (r. 1057-1058) named Humbert chancellor and librarian of the Roman church. Humbert participated in important embassies: the embassy to Emperor Henry III in 1056; and, earlier, the ill-fated embassy to Constantinople in 1054, when he deposited a bull of excommunication of the patriarch Michael Cerullarios on the altar of Hagia Sophia and thus contributed to the growing schism between the Roman and the Greek churches. The main issue separating the churches at this time was that the Roman church insisted on the primacy of the pope. Humbert may have been one of the authors of a retrospective statement (JL 4302) of Leo IX, in which the Roman curia first cited the Donation of Constantine in a specific Italian transmission containing unique variants and placing greater emphasis on the primacy of Rome.

Only one major work can be attributed definitely to Humbert, *The Three Books against the Simoniacs* (*Libri tres adversus simoniacos*). The radicalism of this work assures Humbert a prominent place among the reformers of the eleventh century, although it found only a faint echo among his contemporaries.

Humility of Faenza

Humility of Faenza (Umiltà, Humilitas de Faventia, Rosanese; c. 1226-1310) was an abbess and mystic and was said to be a miracle worker. She is perhaps unique in medieval Italy as a known woman author of a substantial body of Latin texts that are unlikely to have been ghostwritten or significantly redacted by a male secretary or confessor. These are her fifteen so-called *Sermons*, of which some are sermons in the general medieval and modern sense and the remainder—for which she accurately uses the term *oratio* ("prayer")—are formal addresses of devotion to Christ, the Virgin Mary, and others. The writing is forceful, expressive, prone to grammatical errors of case and gender, and replete with resonances of biblical and other widely known Latin Christian texts. Rhetorical artifice is present but not overwhelming. A linear syntax reminiscent of ordinary speech patterns and the occasional inappropriate substitution of one similarly-sounding word for another suggest the oral environment in which these pieces were delivered and taken down by dictation. The present Sermon 9 (the division and arrangement of Humility's work has varied according to the judgment of her editors) consists largely of rhythmic poems of the sort called *laude* ("songs of praise"). Much matter in the higher-numbered *Sermons* can be analyzed somewhat similarly, even if it is not printed similarly; and there is evidence from the early modern period that several passages were sung in Vallombrosian monasteries and transcribed as separate *laude* in Latin or in Italian translations, or both.

Apart from the testimony of the *Sermons* themselves, almost all that we know of Humility comes from two early fourteenth-century lives, one in Latin and one in Italian. She was a talented and determined individual, with little if any formal education, who had been born into a noble family at Faenza. Humility was her name in religion; Rosanese was her original name. She went from married life to the life of a conventual, then became an ascetic solitary, and subsequently founded a community of Vallombrosian nuns. In 1282, together with a few companions, she traveled to Florence, where she established the Vallombrosian convent of Saint John the Evangelist and spent the

remaining years of her life. Humilty was recognized as a living saint both in Faenza and in Florence; shortly after her death she was the subject of a statue by Andrea di Cione (Orcagna) and of a polyptych altarpiece whose paintings have often been attributed to Pietro Lorenzetti. Her cult was authorized by the papacy in 1720 for the Vallombrosians and in 1721 for the dioceses of Florence and Faenza. She was canonized in 1948.

Huns

The Huns seem to have been related to the Hsiung-Nu, a Turkish-Mongolian people who appear in Chinese records of the early centuries C.E. They eventually made their way across central Asia and acquired a fearsome reputation as savage warriors who lived out their lives on horseback. They defeated and absorbed one barbarian group after another, including peoples such as the Gepids, Rugians, Heruls, Alans, and Ostrogoths. In the process, they created a nomad horde. Some their adversaries chose to avoid conflict with them at any cost. The Visigoths, for example, sought refuge in the Roman empire in 376. Pressure from the Huns forced other barbarian groups into the empire as well, and this pressure has even has been blamed for the so-called barbarian invasions.

The Huns themselves, meanwhile, momentarily halted their advance north of the Danube River. For a time, their relations with the Romans were like those of any barbarians, and they often served as auxiliaries in the Roman army. In the early fifth century, however, they grew more restless. A raid across the Danube by their chief Uldin in 408 was beaten back; but in the early 420s the Hun king Rua had to be bought off with a subsidy of 350 pounds of gold per year. This set an unfortunate precedent, for the barbarians' taste for gold obtained in this manner could never be satiated.

In 434, Attila succeeded to the throne. He imposed increasingly severe terms on the Romans, raising the yearly subsidy first to 700 pounds of gold and then to 2,100 pounds. In 447, the Romans agreed to evacuate a strip south of the Danube; its width was that of a five-day march. Around 450, however, Attila seems to have lost interest in the east. The western princess Honoria had written to him, sending her ring and asking his aid. Attila therefore claimed her as his betrothed and

demanded half of the western empire as her dowry. In 451, he led the Huns and their subject peoples across the Rhine into Gaul. After sacking a number of Gallic cities, the Huns were halted at Orleans and then challenged by the western generalissimo Aetius, who had assembled a coalition of Romans, Visigoths, Franks, and Alans. The Huns were defeated on the Catalaunian plain and were forced to withdraw.

In the next year, however, Attila returned and passed through the undefended Alps into Italy. Aquileia was destroyed. Then, according to a pious legend, the Huns were induced to withdraw by an embassy of Pope Leo I, who was assisted in his efforts by apparitions of saints Peter and Paul. Disease, starvation, and the rumored arrival of reinforcements from the east would also have influenced the decision. In 453, Attila died, and in 454, the subject peoples of the Huns revolted, inflicting a disastrous defeat on their erstwhile masters at the battle of the Nedao River. The Huns never again posed a serious threat to the empire.

I

Iconoclasm

In theology, Iconoclasm is the belief that religious art is idolatrous. The term (frequently capitalized, as here, to distinguish it from iconoclasm in general) is usually applied to a movement that troubled eastern Christianity from 726 to 842. Emperor Leo III (r. 717-741) banned religious art in the Byzantine (eastern Roman) empire sometime between 726 and 730. His son, Constantine V (r. 741-775), was even more rigorously Iconoclastic. Iconoclasm waned after Constantine's death, was revived briefly under emperors Leo V ("the Armenian," r. 813-820) and Theophilus (r. 829-842), and then vanished from the eastern Christian tradition.

Contemporaries of Emperor Leo III ascribed his Iconoclasm to Jewish or Muslim influences. Prohibitions against religious art—though often disregarded—exist in both Judaism and Islam, and Islam also prohibits much secular art. The idea that Leo was influenced by Islam is plausible, because he had grown up in Muslim Syria before moving to the empire. Some modern scholars, however, have sought economic explanations, suggesting that Leo and his successors struck at the power and wealth of the Byzantine church, especially the monastic clergy. Other modern scholars believe that Leo was a reformer who genuinely disliked idolatry. In this regard, it is worth noting that the stylized paintings and mosaics which we call "icons" have a more central position in the eastern Christian tradition than statues, paintings, and other forms of religious art have in the west; icons, for example, were used as godparents for infants. A relatively recent theory is that the Iconoclasts saw icons as "windows into heaven," an alternative to the state-controlled Byzantine church. Unsupervised avenues to sanctity could not be permitted to exist—hence the legislation against icons.

Iconoclasm seems never to have been strictly enforced in the areas of Italy that were still under imperial control. As a result, these areas

became valuable repositories of pre-Iconoclastic Byzantine art, much of which was destroyed elsewhere in the empire. In addition, thousands of Iconophiles (called *Iconodoules* in older works), especially monks, emigrated to Italy as refugees from Iconoclastic persecution, augmenting the Italo-Greek population. Iconoclasm heightened preexisting tensions between the Italians and Byzantium and helped pave the way for the papacy's break with the empire in the mid-eighth century.

The *Liber pontificalis*—a series of short official biographies, which vary in quality, of the popes from Saint Peter through the early Middle Ages—includes reasonably good lives of the popes of the Iconoclastic period; Duchesne's edition (1955), while not new, incorporates his corrections, deletions, and emendations up to his death and thus supersedes earlier printings. There is (as of the present writing) no English translation of these parts of *Liber pontificalis*. Goulland (1968) provides a Greek text and French translation of two letters of Pope Gregory II to Emperor Leo III (the first Iconoclastic emperor), protesting Leo's policies. The chronicle of George the Monk is an important source for the second phase of Iconoclasm under emperors Leo V and Theophilus in the first half of the ninth century. Theophanes is the principal Greek source for most of the Iconoclastic era but is badly informed and often confused on Italian affairs. Three English translations of Theophanes are those by Mango and Scott (1997), Santoro (1982), and Turtledove (1982). Of the three, Mango and Scott's version is the most recent (again, as of the present writing) and the best, though it has some weaknesses; Santoro translates the notices from 717 to 803 (a span that encompasses most of the Iconoclastic period) and provides good maps. The chronicle by Nicephorus, an Iconophile patriarch of Constantinople who was dismissed by Leo V, covers some of the same time as that of Theophanes; De Boor's edition of Nicephorus (1880) was superseded by Mango's (1990). Alexander (1958) is the standard biography of Nicephorus.

IESI

The military camp of Aesis, which became the urban center of Jesi, or Iesi, was founded by the Romans on a prominence overlooking the Esino River in the third century B.C. The Esino valley offered rich agricultural lands, and the river offered the possibility of transporting food efficiently. The Via Flaminia (Flaminian Way), one of the major Roman roads, passed by Iesi. In the centuries that followed the decline of the Roman empire, Iesi did not prosper. The urban population fled, the formerly cultivated fields returned to swampland and forest, and the river became impassable. The region was devastated by successive invasions of Goths in the fifth century and Byzantines in the sixth century, and by the predations of Lombards in the eighth century. In 847,

a horrific earthquake was recorded in the March of Ancona, where Iesi is located.

Jurisdiction over the region passed to the papacy with the Donation of Pepin in 756. In the course of the preceding century—the seventh century—Benedictine monks had begun the process of restoring agriculture to the region: draining swamps, irrigating the land of the river valley, and clearing the forests. The land was given over to the production of grain; and to process and distribute the grain, mills were built and the navigability of the river was restored. Agricultural production expanded to include olives, grapes, fruit, and animal husbandry.

Although the precise history of the reconstruction of Iesi during this period is difficult to establish, it is clear that the agricultural wealth of the area renewed the urban center, and ecclesiastical institutions as well as some residences were constructed on the Roman site. Iesi had two patron saints: Settimo and Floriano. The church of Saint Settimo became the episcopal seat in 1119; and the church of Saint Floriano, begun before 1000, is regarded as the heart of the city.

The commune of Iesi dates from the second half of the twelfth century, when the population of the city had not yet surpassed 3,000. The thirteenth century witnessed a systematic expansion of both the population and the area enclosed by protective walls. The commune also maintained and improved the waterways that were vital to its survival.

The jurisdiction of much of central Italy was vigorously disputed by the papacy and the empire during the late twelfth century and the thirteenth century, and Iesi did not escape the conflict. By the thirteenth century, Iesi was firmly entrenched in the imperial camp—in part, one may assume, because the neighboring city of Ancona favored the papacy. Civic strife raged throughout the century as powerful Guelf and Ghibelline families sought to establish dominance. Quite incidentally, the Holy Roman emperor Frederick II was born in Iesi in 1194, when his mother, Constance of Hauteville, interrupted her journey to Sicily there in order to give birth. Legend has it that Constance, who was then forty years old, was compelled to deliver Frederick in a tent in a public plaza in order to prove that he was really her child.

Immanuel Romano

Immanuel Roman (Immanuele Giudeo; in Hebrew Immanu el ha-Romî; c. 1265 to 1331) was a Jewish philosopher and comic poet. He was the son of Rabbi Salomone of the Sifronide (Zifroni) family and was raised in the Jewish community of Rome. Immanuel lived in Ancona, Gubbio, and Verona; worked as a tutor for wealthy Jewish families in Fabriano and Fermo; and was a member of a group of Jewish philosophers centered in Rome and headed by Jehudà Romano (Lionello).

Immanuel's philosophical writings take the form of biblical commentaries in Hebrew. He also wrote, again in Hebrew, a treatise on hermeneutics and a collection of poetry, *Mekhabbêrôth*, inspired by Dante's *Divine Comedy*. In *Mekhabbêrôth*, Immanuel narrates a journey to the inferno and to paradise under the guidance of the prophet Daniel. Immanuel also wrote, in the Italian vernacular, three sonnets, a *tenzone*, and a *frottola* he called *Bisbidis*. In his first sonnet, *Amor non lesse mai l'avemaria* ("Love never read the Ave Maria"), he declares that love observes no particular faith or religion; he thus takes issue with poets such as the stilnovists who depict love in Christian terms. The other two sonnets reiterate Immanuel's pragmatic view of life: he vows to support whatever political faction or religion happens to be in power. In the *tenzone*, Bosone da Gubbio invites Immanuel to mourn the deaths of Dante and of his lady: *Duo lumi son di novo spenti al mondo*

("Two lights are again extinguished on earth"). Immanuel responds *per le rime* (with matching rhymes) in *Io, che trassi le lagrime del fondo* ("I who draw up tears from the depths"). *Bisbidis*, in a kinetic, onomatopoeic style, depicts life at the court of Cangrande della Scala of Verona.

Imola

Imola, an ancient city situated on Via Emilia in the Po River valley, traces its origins to the Etruscans; but came into its own as a Roman municipality in 82 B.C., when it was founded by L. Cornelius Sulla as Forum Corneli. The name Imola was first used by Peter the Deacon and perhaps was the name of the *castrum* (garrison) on the Santerno River.

Imola was badly damaged by attacks of the Ostrogoths and Lombards in the sixth century. It was part of the exarchate of Ravenna until 754, when it passed to papal rule exercised through the archbishopric of Ravenna. The development of local civil government reduced the power of the bishop and created a commune by the late eleventh century. The commune itself yielded to the signorial regimes of Maghinardo Pagano, the Manfredi family, and finally the Alidosi, who ruled the city from 1341 to 1424; there followed a period of intermittent rule by the Milanese. In the late fourteenth century a citizen of Imola, Benvenuto Rambaldi, wrote a well-known commentary on Dante's *Divine Comedy*.

Among the few surviving medieval monuments in Imola are the Rocca (fortress), begun in 1259 and enlarged by Cardinal Bertrando del Poggetto in 1332; and the round bell tower of the church of Santa Maria in Regola, which dates from 1181.

Indovinello Veronese

The *Inaovinello Veronese* ("Veronese riddle") is a short conundrum that can now be found at the beginning of any anthology of early Italian literature. Its language—partly the vernacular but partly still Latin—remains a matter of debate.

The history of the manuscript (a liturgical text) containing the *indovinello* was brilliantly traced by the great paleographer Luigi Schiaparelli. Written in Spain at the very beginning of the eighth century, the codex must have left the Iberian peninsula shortly after the Visigothic kingdom of Toledo fell to the Arabs (711). Through Cagliari and Pisa (where, on the evidence of a signature, it is to be located in the years 731–732), it reached Verona before the close of the century. In Verona, at that time or in the first years of the ninth century, two notes were written in the upper margin of the recto of the third leaf (f. 3r). These two notes were traced by two different hands, but they both show the cursive minuscule of central-northern Italy and are to be considered *prove di penna*—i.e., a few words jotted down by scribes to determine whether their quills had been properly sharpened. The second note is a religious formula of thanksgiving in perfect Latin, all on one line: + *gratias tibi agimus omnip(oten)s sempiternae d(eu)s*. The first note (i.e., the one written on top) is our text, in two lines of sharply contrasting length: + *se pareba boves alba pratalia araba & albo versorio teneba & negro semen/seminaba*. Reading the two notes in Castellani's transcription (1976, the one quoted above), we must keep in mind that, in the original, the words are not separated but written in a continuum interrupted only by the two ampersands and the beginning

of the new line. Once the text had been discovered and published by Schiaparelli (1924), it raised several thorny questions: (1) What was its meaning, and its genre? (2) What was its meter, if any? (3) In what sort of Latin or Italian had it been written? We will consider these questions in turn.

1. The text was at first mistaken for a fragment of a "georgic song." It was recognized as a riddle by Vincenzo De Bartholomaeis, pursuing the idea of a student: the act of writing is indeed suggested through the simile of a field (i.e., the page) being plowed and sowed. This puzzle was not new to the Latin literature of that period; two interesting parallels in the works of Saint Aldelm and Paul the Deacon have been pointed out by Roncaglia (1965). Moreover, Latin verbs of plowing (*arare*, *exarare*, *sulcare*, etc.) had always taken on metaphoric connotations to express the act of writing; and poets from Petrarch (*Rime*, 228.5) to Pascoli (*Myricae: Il piccolo aratore*) kept playing with this analogy. As for the structure of the riddle, however, the precise terms of the comparison are still under discussion. What is the subject of the four verbs? What is, consequently, the "thing" to be guessed? And, in this connection, what verb are we supposed to recognize in the initial clause (*boves se pareba*)? The safest assumption is to take the "scribe" or the "writing person" as the solution of the riddle and to understand the plowman, his figurative counterpart, as the subject of the four clauses. *Pareba* is to be identified not with the Latin and Italian *parere* ("to appear" or "to seem"), but with the Latin *parare* and Veronese *parar(se)*. The translation would thus be: "He (i.e., the scribe-plowman) drove the oxen, plowed a white field, held a white plow, and sowed black seeds"—the oxen being the fingers, the white field {*pratalia*, understood as a collective plural} the page, the white plow the goose feather, and the black seed the ink.

2. Before Monteverdi's decisive intervention (1937), scholars had tried to arrange the text into a quatrain of strangely uneven verses, proposing, one after the other, different rhyme patterns. To this purpose, they started by changing the word order in the first clause (from *se pareba boves* to *boves se pareba*), but the alternating rhyme (abab) so obtained was not credible for such an early period. Then, through an inversion of the order of the two middle clauses (*albo versorio teneba* was placed before *alba pratalia araba*), two couplets (aabb) were

obtained. Next came Rajna's Italianizing remodeling (1928): all the verbs were now made to end in *-eba*, and the quatrain became—more plausibly, it was thought—monorhymed (aaaa). Monteverdi, putting an end to all this arbitrary tampering, showed that the text consisted of two rhythmic (and tailed) hexameters, a well-known medieval imitation of the classical hexameter based on syllabic quantity.

3. As for the language, several vernacular features can certainly be pointed out: initial *se* for *sibi*; verb endings in *-a* instead of *-at*; noun endings in *-o* instead of *-um*; the tonic vowel in *negro* (Latin *nigrum*). Some lexical vulgarisms are even regionally characterized: *pratalia*, as "field," still surviving in the toponymy of the Veneto; *versorio* (compare the Veronese *versòr* versus the Italian *aratro*); *parare* (compare the Veronese *parar i bò* with other examples from northern Italy), in the specialized meaning "to drive" (i.e., to drive oxen yoked to a plow), showing in addition an occasional yielding of *-ava* (first conjugation) to *eva* of the second and third conjugations, a dialectal change now withdrawn to more peripheral areas. (The intervocalic *b* of these imperfect forms is simply to be taken as the historical spelling of Italian /v/.) In this region and at this time, not even a form like *boves* (sigmatic plural) or the adjective *albo*, as a lexical item, can be safely claimed to be a Latinism. On the other hand, Latin is unquestionably responsible for *semen*; for the initial position of the clitic pronoun (*se pareba*—instead of *parebase*, as required by the Tobler-Mussafia law); for the unvoiced dental in *pratalia*; and for the retention of the palatal glide (and final vowel) in *versorio*, when the vernacular must have already had *versòr*.

Considering that we are dealing with a learned circle (the *scriptorium*) and with a literary genre (enigmistics) well represented in medieval Latin, it is not advisable, in the face of such linguistic swings, to introduce the *Indovinello Veronese* as the first document of the Italian language. It is better to view the riddle as a text jotted down in medieval Latin (not "vulgar" or "rustic" Latin, as the text was previously called) by a local scribe, who, having lowered his linguistic guard, could not part from his daily usage but at the same time had no clear consciousness that his *parlar materno* (mother tongue) had ceased to be a mere low register of the Latin in which he had been schooled.

Castellani-Pollidori (1997) has revisited and revived a textual

conjecture by Di Virgilio (1984). According to Di Virgilio, the initial segment (*separebaboves*) should be restored as *separe(s) boves (h)abebe* (or *ageba*), not simply read as *se pareba boves*. In his opinion, in fact, we should acknowledge the presence of the Latin adjective *separ* (normally "severed," "distinct"), whose meaning here would be "unmatched" (*spaiato*) or "uneven," "odd" (*dispart*), with reference to the three or five fingers engaged in the act of writing. Unlike the plowing oxen of the enigmatic metaphor, these fingers do not come in pairs. Castellani-Pollidori settles for *separe(s) boves pareba-*. "He (the plowman-scribe) drove *buoi disuguali*, with the adjective *separ* hinting at the different sizes or lengths of the first three fingers holding the quill—since, on closer inspection, three oxen pulling a single plow proved to be a well-known practice and therefore could not provide the expected "adynaton." Even granting that *separe(s)* could be more than a mere guess, i.e., an appreciable conjecture, Castellani-Pollidori's analysis has more to do with the products of the Latin enigmistics of that period than with the *indovinello* as an early document (no matter how erratic) of Italian Romance. Nothing, in fact, allows us to believe that the sequence *separebaboves*, whatever its literary hinterland may have been, did not have a clear meaning by itself for the scribe who penned it, and for his Veronese fellows.

Inghilfredi

The poet Inghilfredi (Fredi da Lucca, probably fl. mid-thirteenth century) is grouped with the "Sicilians" in MS Florence B.N. Banco Rati 217. Inghilfredi's seven *canzoni* reflect a lyric transition between the Sicilians and later Tuscan poets for whom these verses might have served as models (including Panuccio, Monte, and Chiaro). His *Audite* was probably well known among the lyricists of the later *Duecento*.

Four of Inghilfredi's *canzoni* have amorous themes that demonstrate courtly treatments adapted from Sicilian and Occitan verse. Yet many of these conventional motifs tend to be reconsidered through the influence of the Occitan *trobar clus* ("hermetic style," specifically as practiced by Arnaut Daniel) and of Guittone's formalist poetics (as in *Del meo voler*). While Inghilfredi retains some of the linking structures, such as *capfinidas*, of Sicilian verse, he consistently uses a wide range of rhetorical figures and difficult syntactic constructions which will become the trademark of Tuscans such as Guittone and Monte. His love poetry also subtly incorporates a Guittonean ideology in the reconciliation between divine and human love. Three of his *canzoni*

(*Caunoscenza penosa*, *Dogliosamente*, and *Greve puot'on*) explore political and ethical topics—the decline of traditional values, the pervasiveness of ignorance—markedly evincing the inspiration of Guittone's interpretation of literary culture.

Innocent III, Pope

Innocent III (Lothario dei Conti di Segni, Lothar of Segni; 1160 or 1161-16 July 1216) is often described as the most powerful of the medieval popes; he was certainly one of the most ambitious of all the Roman popes in his assertion of papal authority. He was born into the noble house of the counts of Segni; his parents were Count Trasimund and Clarissa, the daughter of a powerful Roman family. From an early age, the boy was destined for a clerical career. He began his formal education at Rome, where he studied under Abbot Peter Ismael in the monastery of Saint Andrew in Celio. He continued his studies in the liberal arts and theology at Paris, where he was a pupil of Peter of Corbeil and perhaps also of Peter the Chanter. Later, for a time, he was

a student at Bologna, although it is unclear what he studied there. Innocent has often been called a lawyer-pope. There is little in his known writing to support this description; but if he was trained in law, as tradition has it, he almost certainly received that training at Bologna, perhaps from the great decretalist Huguccio (Uguccone da Pisa), whom he treated with deference even after becoming pope.

Innocent (then Lothario) completed his formal education when he was in his mid-twenties and soon thereafter appeared at Rome, where he became a member of the papal curia. He was ordained a subdeacon by Pope Gregory VIII in 1187; and in 1190, at about age thirty, he was named cardinal deacon of Saints Sergius and Bacchus by Pope Clement III.

During his years in the curia he wrote three treatises on moral questions. The best-known of these is *On the Misery of the Human Condition* (*De miseria humanae conditionis*), an extended reflection on the sinfulness of humankind, our utter unworthiness of salvation, and our dependence on the undeserved mercy that God bestows on us. This became a medieval best-seller; it was by far the most widely read of Innocent's writings and survives in some 600 manuscripts. In addition, before his pontificate he completed two other spiritual treatises: *On the Mysteries of the Mass* and *On the Four Kinds of Marriage*.

Pope Celestine III died on 8 January 1198; before that day was over Cardinal Lothario dei Segni had been elected to succeed him. At his coronation six weeks later the new pope took the name Innocent III. During the weeks between his election and his coronation, he had been busy reorganizing the curia and dealing with the political opportunities that the death of Emperor Henry VI had created in the papal states.

During the nineteen years of his pontificate Innocent III was to remain deeply involved in political affairs in Europe and throughout the Mediterranean world. His active pursuit of political goals was consistent with his exalted view of the papacy as the supreme representative of divine authority in the world and of himself as God's principal agent in human affairs. The pope, he declared, was God's chief minister, "set between God and man, lower than God but higher than man, who judges all and is judged by no one." Innocent believed that as pope he had not merely a right but an obligation to intervene wherever God's interests were violated or God's plans, as the pope saw them,

were in danger of being thwarted.

It was entirely consistent with these beliefs that Innocent should pursue active political goals in every part of the world he knew. As the guardian of Frederick of Hohenstaufen, the son and putative successor of Henry VI, Innocent intervened repeatedly and actively in the political maelstrom that swept through the empire in the early thirteenth century. When the German electors failed to agree on the successor to Henry VI, Innocent at first supported the Guelf candidate, Otto IV; then, when Otto failed to observe the commitments he had made about the management of the empire's Italian territories, Innocent switched allegiance and actively promoted the claims of his ward, young Frederick II, who ultimately secured the imperial title, in part as a consequence of Innocent's support. The new emperor's gratitude was deeply (and understandably) tinged with suspicion, however, and his relations with the pope deteriorated perceptibly during the latter years of Innocent's life.

Pope Innocent III, *Liber de vilitate conditionis humane*. Paris: Denis Roce, 1502. Reproduced by courtesy of Department of Special Collections, General Library System, University of Wisconsin-Madison.

Innocent III was also intensely involved in French and English politics. In France Innocent had to deal with the intricate problems raised by the desire of King Philip Augustus to annul his marriage with his second wife, Ingeborg of Denmark, and marry Agnes of Meran. The case not only raised complex questions of canon law but was also fraught with touchy diplomatic issues. Ultimately Innocent prevented Philip from divorcing Ingeborg, but he compromised with the king on

the essential question of the succession to the throne by legitimizing Philip and Agnes's two children. Innocent was simultaneously engaged in a struggle with King John of England over royal control of English bishoprics and, in particular, the succession of Stephen Langton to the archbishopric of Canterbury. The pope placed England under an interdict and forced John to back down, surrender his crown to Innocent, and then receive it back as a papal fief.

Innocent's concept of papal power led him to sponsor military campaigns on many fronts against the foes of Christendom. He strongly encouraged German colonization and the forcible conversion of pagans in the eastern Baltic, and he endowed these colonizing expeditions with the privileges of a crusade. He proclaimed other crusades in the Middle East. One of these, called the Fourth Crusade, made war on the Byzantine Empire—instead of attacking Egypt as Innocent had expected—and, to Innocent's dismay, captured and looted Constantinople, the capital of the largest Christian power of the eastern Mediterranean. Undeterred by this, the pope set in motion a further crusade against Egypt, often called the Fifth Crusade; it achieved a short-lived success when the crusaders briefly captured Damietta, although Innocent himself did not live to see this. Innocent also used the mechanism of the crusade in Europe when he launched the first of a series of attacks that came to be known as the Albigensian Crusade against Cathar heretics in the south of France.

Innocent was also busy with the internal affairs of the church establishment. He spent many hours each day sitting as judge in disputes that had been referred to the papal court from every part of the Christian world. He actively promoted and encouraged new orders of religious men and women, most notably the Dominican and Franciscan friars, as well as numerous smaller groups.

The climax of Innocent's pontificate, in many ways, was the the Fourth Lateran Council, a great meeting of bishops, abbots, and other prelates from throughout the Christian world. This council met in Rome from 11 to 30 November 1215, after more than two years of energetic preparations. Its agenda included a wide array of measures designed to reform the church and to meet the challenges that the pope and his advisers saw facing it. Among these were repressing heresy (the council authorized vigorous new measures against heretics), reforming the

clergy and enforcing clerical discipline more strictly, establishing a minimum wage for the clergy, restructuring judicial procedure by abolishing ordeals as a means of proof, improving the morals of the laity by requiring every Christian to make an annual confession of sins and receive communion, instituting a sweeping reform of the church's marriage law, and numerous other measures, seventy in all, that the council formally adopted at its solemn closing session. The Fourth Lateran Council was thus a major effort to reshape the Christian west, the culmination of Innocent III's grand design to place a newly reinvigorated church at the center of European life and power.

Innocent IV, Pope

Pope Innocent IV (Sinibaldo Fieschi; c. 1190-1254, r. 25 June 1243-7 December 1254) was born in Genoa. He was a descendant of the counts of Lavagna, who had traditionally supported the emperor rather than the pope, even though they themselves produced two popes (Innocent IV and later Adrian V) and several cardinals. After studying canon law at Bologna, he became a notable canonist. He joined the Roman curia under Pope Honorius III in 1226; and under Pope Gregory IX he was appointed vice-chancellor of the Roman church, cardinal priest of Saint Lawrence in Lucina, and rector of the March of Ancona. He succeeded Celestine IV (whose papacy had lasted less than a month) following a two-year vacancy during which Emperor Frederick II Hohenstaufen had prevented the election of a new pope. Innocent IV's choice of his papal name reflected a desire to continue in the wake of his great predecessor, Innocent III.

The struggle between the papacy and the empire reached a climax during the pontificate of Innocent IV. In order to escape imperial domination, the pope was forced in 1244 to flee to Lyon, where he came under the protection of the French king Louis IX and where he remained until 1251. Innocent called the first general council of Lyon (the thirteenth general council of the church) in 1245, to consider and solve several pressing problems. The sentence of excommunication

against Frederick II was renewed: the charges against Frederick included perjury, suspicion of heresy, and failure to heed his excommunication. Innocent pressed the princes of the empire to elect a new king and emperor. Henry Raspe, landgrave of Thuringia, was elected to replace the deposed Frederick in May 1246. After Henry Raspe died in 1247, William, count of Holland, was elected. Frederick then threatened to capture the pope. Evidence to implicate Innocent in an attempted assassination of Frederick in 1246 is inconclusive; but since Frederick was deemed a tyrant and a heretic, medieval law and thought would have justified his elimination. His excommunication was renewed again in 1248. This struggle continued after Frederick died (of natural causes) in 1250 and his illegitimate son Manfred became regent of Sicily.

Innocent IV took an unwavering stand concerning the temporal political power of the papacy. He affirmed that secular power was not ordained by God and was therefore tyrannical. Pontifical power, on the other hand, represented a culmination not only of religious sacerdotal government but also of secular imperial government. These claims did not, in their full extent, become a generally accepted part of the teaching of the Catholic church.

Innocent IV was a patron of legal studies and was himself a canonist. He added several decretals to those of Gregory IX, and his legal reputation rests for the most part on his *Commentaria in quinque libros decretalium*, a subtle and sophisticated, although sometimes obscure, commentary on the *Decretales*. The unique feature of this work is that Innocent included some of his own decretal letters, accompanied by his commentary as a canonist. Because of its intrinsic worth and its authoritativeness, Innocent was called "father of law" by later generations of canonists. Innocent strove to promote learning by protecting students in every way. He also helped establish schools and universities, such as the University of Valencia; instituted schools of theology and of canon and civil law at Lyon and at Naples; founded the University of Piacenza; and granted special privileges to the University of Toulouse.

During his pontificate Innocent had to resolve important issues between factions concerning the internal life of the church. He favored the secular clergy at the University of Paris during their struggle with

the mendicants. In a divisive conflict between Conventuals and Spirituals in the Franciscan order, he sided with the Conventuals; in 1254 he issued the papal bull *Ordinem veterem*, according to which Franciscans were allowed to use money and possessions because the pope himself assumed ownership of such property.

Contemporary evidence makes it certain that it was Innocent IV who bestowed on the cardinals their distinctive red hat, a symbol they have maintained for centuries. Innocent sent missionaries to the far east to convert the Mongols, and the Franciscan John of Pian dei Carpine paid a visit to the court of the great khan in 1246. Innocent's favors to his family, and particularly to his nephews, made him famous (or notorious) for introducing nepotism into church matters. The eventual victory of the papacy over the empire ended the ambitions of the Hohenstaufen to create a centralized state by uniting Sicily and northern Italy.

Inquisition in Italy

The Inquisition was established in Italy during the years 1233 and 1252-1254. In 1233 the first inquisitors were appointed, from among the Dominican order, by Pope Gregory IX, who granted them some authority. Franciscans were first evident as independent inquisitors in 1246. It was the duty of the inquisitors, who were delegated as judges, to track down persons suspected of heresy and submit them to legal proceedings—the inquisition process. In 1252 the antiheretical jurisdiction that had been undertaken since the twelfth century came to a conclusion with the bull *Ad extirpanda*. Two years later an institutional manifestation of the Inquisition was established whereby Innocent IV formed districts in which the Dominicans or Franciscans would be active. The Inquisition in northern and central Italy was structured according to the provinces of the orders of Mendicants. The Dominicans were responsible for all of northern Italy (Lombardy with Bologna, Ferrara, and Parma as well as the March of Genoa); the Franciscans were active in central Italy (the March of Ancona, Romagna, the duchy of Spoleto, and the Roman church province) and in the northeast (the March of Treviso) as well as in Tuscany, to which Sardinia was added in 1285. Only Venice succeeded in establishing its own municipal persecution of heretics, after lengthy disputes with the papal inquisitors. In the south, in 1233, Frederick II established secular inquisitors, who, however, had no widespread success; the ecclesiastical inquisition was introduced by Charles of Anjou in 1268. In 1252 the inquisitor of Lombardy, Peter of Verona, was murdered; he was canonized a year later and became a role model and a source of identity for the Inquisition. Peter's cult became very popular: he was chosen as a patron by many pious lay brotherhoods, which often joined the ecclesiastical authorities in the struggle against heresy.

There was a strong connection between the Inquisition and the mendicant orders: by papal command the heads of these orders chose inquisitors; those inquisitors usually lived in monasteries of the orders; and the proceedings were also held in these monasteries if the inquisitors were not traveling around as judges.

The punishments imposed by the inquisitors as penance mainly

involved undertaking pilgrimages; wearing a yellow cross or some other symbol, depending on the nature of the crime; and imprisonment. Heretics who were unwilling to recant or were recidivists might be transferred to a secular court and executed, but this step was rarely taken.

The Italian inquisitors persecuted various heretical groups. The Cathars, who included many refugees from Languedoc, were probably the largest such group. There were also a few Waldensians in Italy, although most of them were able to take refuge in the deserted Alpine valleys. The Guglielmites in Milan and the Apostles, followers of Gerard Segarelli and Dolcino of Novara, were heresies that existed only in Italy or had roots there. The Franciscan Spirituals were persecuted as well. The Inquisition took part in some military undertakings against the heretics—for instance, in the fights against the Cathars of Sirmi-one near Verona (1277) and against the Apostles (1307). It was also involved in some primarily political disputes, such as the fight against Frederick II and his followers.

In Italy, which was politically divided, the effectiveness of the Inquisition depended considerably on its acceptance by the various cities and regions—much more so than in southern France, the main area where heretics were active. The Italian Inquisition was established at a time when the emperor and his Italian allies were in conflict with the pope, as were certain communes; and the papacy used the persecution of heresy as a political weapon. Thus the inquisitors were not always accepted in the cities, and there were uprisings against them, especially when their verdicts were unpopular.

The inquistors used written documents to an extent that almost reminds us of modern dictatorships. In general, though, historians have not been able to trace the activities of the Inquisition in Italy to the same extent as in France, since the records from Italy are less ample: extensive files exist only in Orvieto, Milan, Ferrara, and Bologna. However, the Italian inquisitors produced some polemic and didactic literature. Some of these inquistors, such as Rainer Sacconi and Anselm of Alessandria, were themselves former heretics, and their writings provide interesting insights, particularly into Italian Catharism.

It is difficult to say how far the Inquisition was responsible for the disappearance of the large heretical movements in the fourteenth

century; evidently, these movements had lost much of their religious appeal among the people. In any case, as the heretical movements decreased, the importance of the Inquisition also diminished, though it continued to exist and even became active in new areas, such as profiteering. Not until the Counter-Reformation was the Roman Inquisition revived.

Intelligenza

Intelligenza is an anonymous didactic poem with an allegorical frame, written in Florence c. 1300. It is preserved in two fourteenth-century manuscripts in the Biblioteca Nazionale Centrale of Florence: Magliabechiano VII 1035 and Laurenziano Gaddiano 71 (in the latter codex the first forty-six stanzas are missing). The poem was discovered by Francesco Trucchi (1846) and was first published by the French scholar Anton Francesco Ozanam in 1850. Other editions followed—by Carlo Teoli (i.e., Eugenio Camerini) in 1863, Domenico Carbone in 1868, Paul Gellrich in 1883, and R. Piccoli in 1911—partly because of a connection with the chronicler Dino Compagni, to whom the poem was persistently, though more or less hesitantly, attributed. The first critical edition, which is still also considered a basic reference for a study of the sources, was provided by Vittorio Mistruzzi (1928). Later editions by Luigi Di Benedetto (1941) and Giuseppe Petronio (1951, 1967) are also valuable. The attribution to Compagni, now completely discredited, went back to a note penned at the foot of the poem as a colophon in the Magliabechiano manuscript. That note, by a different and more recent hand, was only partially legible: *Questo si chiama La intelligentia...* Colombo De Batines, in collaboration with Ozanam, applied chemical reagents to the page and was able to discern some other words (which have since been irretrievably lost): *la qual fece ser Dino Chompagni*. Other possible authors have been proposed from time to time; some of these proposals were ingenious, but they were not supported by cogent reasons.

The 2,781 hendecasyllables of the poem are grouped into 309 stanzas, whose structure (abababccb) is rather peculiar. In fact, were it not for the last line, this *nona rima* would be identical to the octave (*ottava rima*), which was to emerge as the dominant metrical form three or four decades later in Boccaccio's narrative poetry (*Filostrato*, *Teseida*). Even considering the challenge presented by this demanding pattern

(three rhyming words for a and four for b), we must admit that the author too often relies on easy or "grammatical" rhymes, and even on repetitive and imperfect ones.

The content of the poem is distributed with no real sense of proportion and usually on the basis of flimsy connections. The poet relates how, on a glorious day in spring, *fin Amor* ("noble Love") has him fall in love with a lady of wondrous beauty, whose precious attire is lavishly described. The sixty gems on her golden crown give the poet an opportunity to versify a great Latin work, the *Liber lapidum* of Marbodius of Rennes (d. 1123)—or, more precisely, an Italian translation of it that Zuccherò Bencivenni had just made (stanzas 16-58). Then the *alto palazzo* ("lofty palace") where the lady lives is described (59-70): this palace, situated in the east and wrought in Indian style, has been directly made by *Amor divino* ("divine Love") and surpasses anything Polyclitus could have done (see Dante's *Purgatory*, 10.32f, 94-96). Here the model is a splendid palace that, according to several hagiographies, the apostle Thomas built for the king of India. From this point on, 219 stanzas are devoted to a description of the marvelous reliefs, paintings, and mosaics adorning a great vaulted hall (though no clear distinction is made among these decorations). After a brief mention of Fortune's wheel (70), there is a court of love or triumph of love (71-76). Then the author begins versifying *I fatti di Cesare* (*The Deeds of Caesar*), up to stanza 215. *I fatti di Alessandro* (*The Deeds of Alexander*) provides the material for the next section (216-239). The Trojan cycle and two final stanzas (287-288) reserved for the Round Table bring the artistic and historical sightseeing to an end. In the stories of Caesar, where direct speech is often introduced, the poet resorts to *visibile parlare* ("visible speech"): *Ed èvi come disse* ("And it was just as it was told," 112); *Tutto dipinto v'è come dicia* ("It was completely pictured there as it was said," 191); and so on. However, he does not make any rationalistic fuss about this narrative convention (as Dante would do in *Purgatorio* 10); it is applied only to solve (or not solve), in terms of wonder and mystery, the empirical problem he felt compelled to raise.

Having returned to the lady, the poet lists the seven queens (or Virtues) of her entourage (Courtesy, Loyalty, Humility, Liberality, Decency, Chastity, Pity) and devotes three stanzas (293-295) to the musical accomplishments of her court, including a *lot* on the death of

Tristan. At the end (297-298), in order to ascertain whether he is worthy of being promoted to a superior level of existence, the poet, assisted by the god of love, is examined by the lady and, having been found capable of loving, he is given her favor and is made "lord of all riches." An appendix of eleven stanzas (299-309) expounds the allegory of the poem. The lady, we learn, is *amorosa Madonna Intelligenza* ("lovely Lady Intelligence"), who resides in the human body and soul, and at the same time in the empyrean, where she has the angels move the heavens according to God's will. (She thus represents human intelligence and also Averroes's "possible intellect"). Her palace is explained as a psychological and physical allegory of the human body, the painted hall representing nothing other than the mind retaining concepts and learning.

Both *Intelligenza* and Brunette Latini's *Tesoretto* are aimed at disseminating knowledge among the rich bourgeois. Their allegories are more philosophical than religious and promote a tendentiously lay culture whose Aristotelianism still bears the imprint of its Arabic transmission. Of the two works, *Intelligenza* is more complex and more ambiguous. Its didactic organization is deficient and its sources are hastily and often clumsily versified; but everything concerning the *oltremirabile* ("exceedingly wondrous") lady and the intellectual love she so powerfully inspires reveals a sensitive artist close to the *stilnovisti*, endowed with a luminous and joyful sense of nature (see, for instance, the vernal opening, 1-3), and attracted by exotic tales and fabled countries. In the lyrical flashes of the narrative and in the vivid colors of certain fragments, we can already perceive, as Lanza (1994) has pointed out, the rise of the late Gothic taste which would reverberate in Florentine literature of the fourteenth century (including the work of Boccaccio) and beyond, until the exquisite elitism of Giovanni (Gherardi) da Prato.

Investiture Controversy

The investiture controversy (c. 1049-1122) was a series of disputes between the *papacy* and emperors having to do, at least at base, with the right of a king or emperor (a layman) to bestow the symbols of clerical office on abbots and bishops. This controversy was both a cause and a result of the transformation of Europe that occurred from the tenth century to the eleventh. In its narrowest definition, it was a struggle over electoral procedure in the church, and consequently over the degree to which secular rulers could legitimately intervene in church government.

The reasons why investiture became the signature of this many-sided and long-lasting conflict lay in the slow evolution from tribal to feudal society. Through their property, churches (including monasteries) had been incorporated into the governmental order in Europe—a military, landed aristocracy. That order did not constitute an abstract, readily diagrammed system of offices. There was no money economy; services were paid for with other commodities, including the use of property and prerogatives, such as the administration of justice.

Therefore, governmental order comprised an intricate and ever-changing pattern of personal loyalties, generally secured by property given in fee tenure. The intended result of fee tenure was to establish

mutual obligations, in which, however, the recipient of the benefice was beholden to the giver for the duration of the tenure. The bargain was commonly sealed by a ritual through which the giver "invested" the recipient with the fee.

Difficulties arose on several counts when the fee givers were laypeople and the recipients were clergy. According to theology, ruling and teaching offices in the church were conferred by charismata of the Holy Spirit, expressed through free election. But not uncommonly, a lord's zeal to consolidate political dependence, or his sense for dynastic advantage, or simply his avarice, made these transactions tantamount to selling ecclesiastical offices. Moreover, when secular princes performed investiture with temporalities, normally before consecration, they conferred its material faculties independently of the spiritual function those faculties had been intended to support, thus rendering consideration as well as election nugatory. They also used emblems of spiritual office—such as the bishop's ring, symbolizing his spiritual marriage to his church; and the crosier, representing the rule of souls. Church law had long forbidden the sale of ecclesiastical office as the crime (or heresy) of simony. Beginning with the pontificate of Pope Leo IX (r. 1049-1054), the constitutional and ceremonial aspects of lay investiture came under attack.

Important episodes in the investiture conflict occurred in England and France. However, the main theater of war was the empire, and the chief antagonists were popes and German kings. The historic partnership between empire and papacy, sealed by the coronation of Charlemagne in the year 800, had continued in European history for three centuries. The investiture conflict tore it apart.

Several lines of development, some beginning in the tenth century, produced this result. One was a movement of moral reform centered in the monasteries of Flanders, the Rhineland, Burgundy, and Italy; a revival of the study of canon law was part of this movement. A second development was the consolidation of royal authority in Germany, far beyond what had been achieved at that time elsewhere in Europe, and of a new ideology portraying the king as in some sense the "head of the church" and the royal coronation as conferring a sacramental character resembling that bestowed through episcopal consecration.

A series of German kings encouraged the spread of reform ideology

in their lands, imposing it last and most fatefully on the papacy itself. At the synod of Sutri (1046), Emperor Henry III reversed a profound degradation of the papacy by securing the deposition of two claimants to the papacy and the abdication of a third. Under Henry's guidance, the synod elected Bishop Suidiger of Bamberg as Pope Clement II, the first of five German popes who both began the reformation of the Roman see and prepared it to impose reforms on the whole church.

Under Leo IX, the last of these five popes, the constant goal of papal reform was set forth and enforced: the extirpation of simony, lay investiture, and clerical incontinence (Nicolaitism). However, the conflict between empire and papacy over this goal did not break out until the pontificate of Gregory VII (r. 1073–1085).

The rupture was quite sudden. Gregory VII began his pontificate in a conciliatory atmosphere. But festering conflicts between imperial and papal factions in Milan, together with other points of dispute, plunged the pope and King Henry IV into strife. The open battle came early in 1076, when Henry called a synod of his bishops in Worms to hear charges of personal immorality and official malfeasance against Gregory. The synod declared Gregory deposed, and Henry followed its lead by renouncing his obedience to Gregory. News of this drastic action reached the pope while he was presiding over his regular Lenten synod in Rome. Gregory and his synod responded in kind, excommunicating the king and also the bishops who had signed the decree at Worms. Henry was declared deposed from kingship in Germany and Italy, and his subjects were absolved of their oaths of fealty to him. Gregory interpreted some events in the distant past as precedents for his action; but in fact, although earlier kings had deposed popes, no pope had ever claimed to depose a king. This assertion that kings were accountable to popes for their official conduct marked the beginning of a long and stormy contest for dominance between church and state.

The partial reconciliation between Henry IV and Gregory VII at Canossa (1077) indicated that, at least technically, the exchange of depositions had not been a point of no return. As the conflict continued during the next half century, first after Gregory's death (1085) and then after Henry's (1106), there seemed to be many junctures at which some compromise would be reached.

From 1076 onward, the campaigns for and against lay investiture were aspects of civil war in which it became increasingly easy to separate the symbolic act of lay investiture from the substance of political control. When, without the rigors of civil war, the dispute was settled in England (1106), in France (1107), and last of all in Germany (1122), obligations continued to be established between kings and prelates that were binding with or without consecration; and the original causes of the investiture conflict remained alive. Adherence to the reformers' prohibition of simony and of clerical incontinence was also imperfect. However, these practices existed in a context very different from that of 1076.

All parties to the dispute had used the strategy of "divide and conquer." By playing faction against faction, they had encouraged the growth of new political entities and principles. Often, the episcopal office in a city was claimed by two rivals—one backed by an imperial faction and the other by a papal faction. Each appealed to public sentiment, with the result that, amid ensuing urban warfare, independent town governments, or communes, grew ever stronger, especially in Flanders, the Rhineland, and northern Italy. In some cases, communal governments excluded whole successions of bishops from their sees for generations.

The papacy's strategy of dividing to conquer had other results in Germany. There, the long history of excommunications, depositions, and civil war established the important principle that kings were accountable for their official actions, and that kings who were "unworthy" of their office (or "ministry") could be deposed. Gregory had asserted that popes could judge and depose kings for official as well as personal conduct. But in Germany there arose the more durable argument that kingship was an electoral office, and that kings represented and were accountable to their electors.

The papacy, too, was changed by the divisive tactics of civil war. Its search for allies eventually led it to forsake its historical alliance with the empire in favor of one with France. This momentous political realignment, first signaled by the flight of Pope Gelasius II to France for safety (1118-1119) and the election of Pope Calixtus II, formerly archbishop of Vienne, reached a climax in the "Babylonian captivity" of the papacy in Avignon (1305-1378).

Furthermore, the constitutional principle of the right of resistance came to be applied to popes as well as to kings. While popes used deposition and excommunication as weapons against kings in the investiture conflict, kings retaliated with the same weapons against popes and indeed promoted the election of two antipopes. The papacy was indisputably an electoral office. The regular use of councils raised the basic question whether, if a pope was flagrantly immoral, heretical, or tyrannical, his electors (or their representatives) could bring action against him through a council representing the whole church. The prominence that the College of Cardinals quickly gained made it, along with the council, another collective counterweight to papal autocracy. Thus in the church, as well as in secular rule, the investiture conflict resulted in the formulation of ideas of constitutional and representative government.

More than fifty years of civil war also brought immense devastation. The German kingdom, once the most secure in Europe, lost its fiscal basis through the dissipation of crown lands. Its kings lived from their dynastic holdings; and the kingdom itself, as a corporate whole, was rapidly surpassed by England and France. The once numerous free peasantry was, in the main, reduced to serfdom. With the disintegration of royal power, the diffuse, mediating levels of feudal tenure gradually ended the power of kings to govern directly. Italy, too, was a scene of vast destruction. Political order was irreparably fragmented. The atomistic communes of the north were divided into factions, continually at war, which eventually were known as Guelfs and Ghibellines. Rome itself was a chief sufferer; it was largely destroyed by the Norman protectors of Gregory VII when they rescued him from an imperial siege (1084), and it was further reduced by the factional warfare that prevented Pope Urban II from regaining complete control of his city for ten years after his election.

The Norman state that was formed in southern Italy is an exception to this picture. The Normans were at first opposed by Pope Leo IX, but they soon received investiture for lordships in the south and in Sicily from Pope Nicholas II. Eventually named apostolic legates of the pope, they achieved virtually complete control of the churches in their lands. Finally, they were invested (albeit by the antipope Anacletus II, 1130) with the kingship of Sicily. But there were seeds of destruction in this

alliance, for when a dynastic marriage united the empire and the Norman south, the papacy found itself pinioned between two great and potentially hostile powers. One sequel to the alliance between the papacy and the Normans in the age of the investiture conflict was the devastating warfare between the papacy and Frederick II in the thirteenth century. Then, the ruin of the empire, begun two centuries earlier, was accomplished; and the papacy, amid its triumph, was set on the road to exile and degradation in Avignon. The political unions of Germany and Italy, in 1870, closed the story of social collapse that had opened with the reciprocal condemnations of Henry IV and Gregory VII.

Irnerius

Irnerius (Wernerius, Gernerius; early twelfth century) was a Bolognese jurist. As a lawyer and judge, he signed several charters in 1112-1125 ("Wernerius" or, once, "Gernerius" was the way he wrote his name). Irnerius was a partisan of emperor Henry V and served Henry during his Italian expedition in 1116-1118. Irnerius assisted at the election of the imperial antipope Gregoiy VIII (Burdinus) in 1118 and was therefore excommunicated by the Council of Rheims in 1119.

From the last third of the twelfth century on, our picture of Irnerius is enriched by several chroniclers and law teachers, particularly the gossip Odofredo in the thirteenth century: Irnerius was invited by Countess Matilda of Tuscany to teach Roman law at Bologna and did so with such success that he was known as the "light of the law" (*lucerna iuris*). Modern scholars have further elaborated Irnerius's biography, and some have attributed to him, though without good reason, a large number of anonymous legal works (Kantorowicz, 1969).

Only one work, an introduction to Justinian's code, can, with confidence, be ascribed to Irnerius, and this work is short and unsophisticated. A large number of glosses found in twelfth-century manuscripts have been attributed to Irnerius on the basis of the signature "y" that accompanies them. It has, however, been argued that this "y" is not a signature and does not reveal anything about the authorship of the gloss, particularly since it is difficult to fathom why a man who wrote his name "Wernerius" would use "y" as a signature (Dolezalek 1985; Winroth 2000). In this view, there is little evidence that

Irnerius was a teacher of Roman law, not only a practicing jurist. It has also been suggested that his role in creating the Bologna law school is much exaggerated (Southern 1995; Winroth 2000); according to this view, the school was founded by a later generation, including Bulgarus de Bulgarinis and Martinus de Gosia.

Iron Crown

The Iron Crown, now in the treasury of the cathedral of Monza, was purportedly the crown of the Lombard kings, taken over by their successors to represent the Lombard portion of their realms. The date and place of origin of the crown are a subject of great controversy,

however, with estimates of its origin ranging from fifth- or sixth-century Byzantine to tenth-century Italian. The political and sacred significance of the crown are also matters of controversy. If the crown was in origin merely votive (like other Lombard votive crowns in Monza or the Visigothic votive crowns in Paris and Madrid), it would have played a less important political role. If its creation represented an early appearance of metal crowns as symbols of political authority, to be invested in an elaborate coronation ritual, its political role would have been more important. The sacred significance of the crown was enhanced by a traditional story that the narrow iron band on the inside of the crown (which holds together six rectangular gold sections decorated with enamel work and encrusted with gemstones) was made from one of the nails of Christ's cross found by Helena, the mother of Constantine. Tradition also associates this crown with Theodolinda, queen of two successive Lombard kings, Authari and Agilulf; she is said to have given it to the cathedral of Monza.

Another traditional story is that this crown was the one used by Charlemagne to crown himself king of the Lombards in 774 after his defeat of the last Lombard king, Desiderius. There is firmer evidence that the crown was used by Otto I, Otto III, Henry IV, Conrad III, and Frederick I Barbarossa of the German Roman empire.

The significance of the crown was enhanced when Napoleon carried it back to Paris and it was used in his coronation in 1805; it became the symbol of his Order of the Iron Crown. Later the crown was carried to Vienna and used in the coronation of Ferdinand I in 1838; there, it became the symbol of the Austrian Order of the Iron Crown. It was returned to Italy in 1866 and was deposited in the treasury of the cathedral of Monza; it may have been a model for the seal of the Italian Order of the Crown.

Isaac Master

The Isaac Master is one of many medieval artists whose historical identity rests solely on the survival of a stylistically coherent body of work that is otherwise undocumented. The name Isaac Master refers to frescoes representing the Old Testament story of Isaac in the upper church of San Francesco at Assisi; other frescoes in the upper church, dealing with subjects from the New Testament, are also attributed to this artist. Of the entire group, the frescoes representing the story of Isaac are the best-preserved.

Art historians generally agree that the Isaac Master was trained in Rome and, together with other Roman artists, was employed in the basilica at Assisi in the third quarter of the thirteenth century. The frescoes by the Isaac Master at Assisi were probably executed after the completion of Cimabue's work in the transept and choir, and they were definitely executed before the famous Saint Francis cycle in the nave, which is the work of early fourteenth-century followers of Giotto. A generally accepted date for the frescoes of the Isaac Master is between the mid-1280s and the mid-1290s. Stylistically, the Isaac Masters art represents an important step between the Italo-Byzantine manner of Cimabue and the later proto-Renaissance art of Giotto. As is evident in the fresco *Isaac and Esau*, the master's art is characterized by a developing command of illusionistic space, strongly modeled figures, and a narrative rich in psychological resonance. There is also a pronounced classicism in the Isaac Master's art, which closely aligns it with the work of his Roman contemporary Pietro Cavallini.

Isidore of Seville

Isidore of Seville (Isidorus Hispalensis, saint; c. 560-4 April 636) may have been born in Cartagena. He was raised in the cathedral school of Seville, the first of its kind in Spain, by his older brother Leander, who was archbishop of Seville. On the death of Leander, Isidore succeeded his brother to the see of Seville in 599. Isidore is considered the last of the great Latin fathers. He presided over the Second Council of Seville in 619; but he exerted his greatest influence in 633 at the Fourth Council of Toledo, where he established liturgical and doctrinal uniformity throughout Spain and southern France. He founded seminaries in all the cathedral cities, stopped the influence of Arianism and Acephales in Spain, and supported and espoused the teaching of the Greek classics.

Isidore of Seville. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 151 v.

Isidore was undoubtedly the most learned man of his age, and he was also an extraordinarily prolific writer. He is best-known for his encyclopedic summa of universal knowledge, *Ety- mologiarum sive Originum libri XX* (*Twenty Books of Etymologies and Origins*), which epitomized all learning up to that point, ancient as well as modern. *Etymologiae* contains quotations from more than 150 authors, both Christian and pagan. It was used as a textbook throughout the Middle Ages and was printed ten times between 1470 and 1529.

Isidore's other writings were equally important and voluminous. *Historia de regibus Gothorum, Wandalorum, et Suevorum* (*History of the Goth, Vandal, and Suevi Kings*) is the chief authority on Gothic history in the west. *De natura rerum*, a manual of elementary physics, was one of Isidore's most popular and best-known books in the Middle Ages, as was *De fide catholica ex Veteri et Novo Testamento, contra Judaeos*. *De ecclesiasticis officiis* discusses the Mozarabic rite and music in general. *De viris illustribus* is a work of Christian biography, important in the literature of patrology. *Regula monachorum* gives rules and guidelines for monks and the monastic life. These books are only a small fraction of Isidore's contribution to medieval literature and

knowledge.

Isidore died in Seville.

Italian Folklore

Folklore is expressive culture transmitted through informal channels, such as by word of mouth or by imitation. The term often refers to the culture of the common people, which is usually passed on in this manner as opposed to being written down; but the elite and educated classes in any society have their own folklore as well. Folklore also includes "folk life"—all aspects of folk culture having to do with the satisfaction of material needs, such as vernacular architecture, cooking, crafts, farming practices, and animal husbandry. Folklore played an important role in most people's lives in Italy between 300 and 1375. However, it is difficult to reconstruct precisely all the genres (types) of

folklore that were current and the forms they took. Most knowledge of medieval Italian folklore comes to us from contemporary written works. Thus we know most about the verbal genres (folktales, folk poetry, proverbs, riddles, etc.), and they will be the primary focus of this article. Through contemporary accounts, we also know about folk beliefs, games, customs, and festivals. Some of these, like the Palio of Siena, have survived to the present day; others have changed or disappeared with the passage of time. It is sometimes possible to surmise that a certain aspect of folklore existed in the Middle Ages simply because it survived to be documented in a later period.

Folklore varies from region to region and changes in response to historical factors and the artistic input of individual performers. For this reason, it always reflects the values of the community that produced it and is best understood within its cultural context. At the same time, it exhibits a certain stability over time and space; thus we can recognize that the Italian ballad *Il testamento dell'avvelenato* ("The Poisoned Man's Will") is essentially the same song as the English and Scottish popular ballad "Lord Randall." The two ballads, however, may have had radically different meanings to the people who performed them and their audiences; and those meanings may have differed with every single performance of the ballad. Much of this contextual information is lost when folklore turns up within a literary text.

Folklore and Literature

Folklore and literature have always had a symbiotic relationship. Writers such as Dante and Boccaccio drew freely from the folk traditions with which they were familiar, adapting material to their own purposes. Also, literary material often influences folk traditions. The *Chanson de Roland*, itself based on folk legend, inspired the plots of the Sicilian *teatro dei pupi* (puppet theater). In reconstructing folklore from literary sources, it is important to keep in mind that the author may have modified the text, and that the text is in any case only one of hundreds of equally legitimate versions that were in oral circulation at the time.

Folktales

Folktales were among the most widespread forms of entertainment during the Middle Ages. They were performed both by storytellers within a family setting, such as at a *veglia* (evening of storytelling) or during agricultural labor, and by semiprofessional entertainers such as the *cantimpanca* or *cantastorie* in a public square for large groups. Folktales include various types of narrative intended by performers, and understood by audiences, as fictional. The magical tale (or *märchen*), which seems to have originated in Europe during the 1100s, was among the best-known of this type. Set in a fictional, timeless world characterized by the presence of magical helpers, this type includes such well-known favorites as *Cenerentola* ("Cinderella"), *Il drago dalle sette teste* ("The Dragon-Slayer") and *I due fratelli* ("The Two Brothers"), often combined with earlier types in Italian variants. Whereas these tales were common throughout Europe, *Liombruno* seems to be a uniquely Italian folktale and is one of the best examples of the genre as it developed in the Middle Ages.

The fabliau, another fictional narrative characteristic of this period, developed in France but was also prominent in Italy. It is a humorous tale usually centered on a ridiculous situation or the actions of stupid people. Often, authority figures such as clergymen are mocked in fabliaux. In Italy, the folk characters Vardiello, Giuffà, and Giucca Matto were often trickster-heroes in fabliaux.

Legends and Exempla

In contrast to folktales, legends and *exempla* are set in the real world and told as if true. Legends usually deal with intrusions of the supernatural or the sacred into the everyday world; stories about ghosts, witches, and fairies (*fate*, *folletti*) are examples of legends. In addition, many religious legends developed in the Middle Ages that were centered on the lives and exploits of saints. *Exempla* are stories of a moral nature, often used by the clergy to instruct their congregations.

Folk Song and Folk Poetry

Much of Italians' love of poetry and song is deeply rooted in the folk tradition. Surely in the medieval period mothers sang their infants to sleep with lullabies (*ninna-nanna*); hearts were won with love poems; and songs were an integral part of weddings, celebrations, and even funerals (in the form of ritual laments). However, relatively few of these found their way into manuscripts for us to document today. One form of Italian folk poetry that can be dated definitively to the 1200s is the *strambotto*, also known as *rispetto* or *canzona*. This is a lyric single-verse love song, typically with eight lines and an alternate rhyme scheme. (In Tuscany, the last four lines were rhymed couplets.) The *strambotto* was found throughout the Italian peninsula, and in fact is closely allied with similar forms found in the Romance world. In the 1400s, the *strambotto* became a literary genre as various literary figures (among them Leonardo Giustinian, Lorenzo the Magnificent, and Poliziano) tried their hand at composing it.

Another genre of folk poetry dating from the Middle Ages is the ballad. The ballad is not as old as the *strambotto*, it came to Italy from France during the late medieval and early Renaissance period. It is typically a long narrative song consisting of four-line hendecasyllabic verses and narrating a tragic or dramatic story. Ballads were often based on legends or events that purported to be factual; the use of rhymed dialogue made them seem immediate and real to their audiences. Among the best-known Italian ballads are *La donna lombarda*, *Rinaldo*, and *La pesca dell'anello*.

Riddles and Proverbs

A riddle (*indovinello*) is a question with a predetermined answer and a blocking element, so that the answer is not immediately apparent or is purposely concealed. The earliest Italian riddle on record, the *Indovinello Veronese*, dates from the late eighth or early ninth century; it compares a farmer plowing and sowing with his oxen to a scribe writing on paper. Like many Italian riddles, it consists of rhymed couplets and compares two dissimilar yet familiar things.

Like a riddle, a proverb sets up a comparison between two situations: its own internal situation, and the one to which the performer applies it. Proverbs, too, may rhyme or contain a play on words (e.g., *fratelli flagelli*); they often consist of two balanced equivalent sections.

These two genres exhibit a high degree of conservatism because of their brevity; thus many riddles and proverbs in use during the Middle Ages have survived to the present day relatively unchanged. Their original role, however, was quite different. In a largely oral culture, the ability to solve riddles was regarded as a mark of cleverness, and adults enjoyed riddles as much as children. Proverbs, too, were held in higher regard during the Middle Ages, and the knowledge of many proverbs was considered an indication of great wisdom. Both riddles and proverbs had literary as well as popular forms.

Customs and Festivals

The life of each individual and the cycle of the year were marked by certain recurring events; these are called life-cycle and year-cycle rites. Each rite was associated with particular customs, depending on the time and region in which it was found. Rites related to an individual's life included customs surrounding birth, baptism, marriage, and death. For instance, in many parts of Italy, on the day of a wedding the bridegroom would go to the bride's home, where he would recite a formula requesting the most beautiful girl in the house. The bride's family would try to pass off various friends of the bride as *La più bella* ("the most beautiful"), until at last the bride would emerge. At funerals, some regions of Italy preserved until quite recently the custom of ritual laments for the dead, sung as they had been during Roman times by groups of women. In almost all cases, these customs derive from pre-Christian traditions; during the Middle Ages they were gradually modified to include Christian elements.

The year-cycle rites were organized around the Christian calendar, but here too echoes of pagan customs persisted late into the medieval period. The early Christians organized their calendar so that major feast days coincided with important pagan festivals: the birth of Christ coincided with the Saturnalia, for example, and Saint John's day with

the summer solstice. Customs associated with an earlier festival would continue to be practiced despite the new associations. The celebration of May as the month of the Virgin, introduced in the twelfth century, was an attempt to replace the pre-Christian custom of crowning the queen of May and celebrating the fertility of crops and livestock through various propitiatory rites. However, in much of northern and central Italy, the custom of crowning a May queen and dancing around a May tree persisted through the Middle Ages and even into recent times. And the church was never entirely able to suppress the celebration of carnival, with its revelry and its symbolic inversion of the social and political order. These customs were preserved because they served a special role in the expressive life of Italian communities. The major festivals connected with the year cycle included Christmas, carnival, Holy Week and Easter, May celebrations, Saint John's day, the feast of the Assumption, Michaelmas, and All Saints and All Souls.

The church also introduced to the year cycle its own set of feasts and customs. Folk drama in the Middle Ages was largely connected with the passion of Christ during Holy Week; and it was during the medieval period that each Italian town adopted a patron saint and the custom of celebrating the saints day with feasting and games began.

Games

The celebration of saints' days with games became widespread in Italy during the High Middle Ages. Many of these games pitted a town's social classes, guilds, neighborhoods, or families against one another to win a prize. The famous Palio of Siena—a horse race run by the seventeen *contrade* (neighborhoods) of the city to win the *palio*, a banner bearing the figure of the Virgin—was only one of a number of such races in various Italian cities during the time of Dante. In Gubbio, the *corsa dei ceri* was a race between the members of three social groups: each group ran carrying a huge wooden pillar bearing the statue of its patron saint. Pisa had its *giuoco del ponte* ("game of the bridge"); Perugia had a *battaglia de' sassi* ("game of the stones"); and the Florentines played a *giuoco del calcio* ("game of football") that was an early version of soccer. Such ritualized combats served to formalize

social conflicts and thus, to some degree, contain them.

Folk Belief Systems

The worldview of the medieval Italian was characterized by a belief system based on the principles of sympathetic magic. This concept pervaded every aspect of folk belief, from folk medicine to folk religion. Another characteristic of medieval folk belief was a syncretism of pagan and Christian elements. A folk cure for hernia, for example, combined elements of pre-Christian magic, such as passing the patient through a cut made in a tree branch, with prayers to Saint John the Baptist. Folk religion was especially characterized by such juxtapositions because Christian feasts and festivals had often been superimposed on previously existing pagan customs. Christianity never completely succeeded in suppressing earlier beliefs and customs, but their nature changed to include Christian symbolism. For instance, Diana and Hecate ceased to be worshiped as goddesses, yet these figures remained alive in folklore as *fate* (supernatural creatures; loosely, "fairies"). Many aspects of medieval folk belief are accessible to us from hagiographies, medical treatises, and works of fiction.

Italian-Hebrew Literature

Although Jews have lived on the Italian peninsula since the last centuries B.C.E., and although the prominent historian Josephus Flavius composed his historical works (in Greek) at Rome, no significant evidence of Italian-Jewish literary activity in the Hebrew language has been preserved from ancient times. Indeed, not until the ninth century C.E. do we find solid evidence of Hebrew literature being produced in Italy. However, from that time until the close of the period under consideration (1375), Hebrew literature flourished in all the medieval genres. This article, which is by no means comprehensive, can only

survey some of the most prominent works.

The religious poetry of Shephatiah ben Amitai of Oria is the earliest preserved example of Italian-Hebrew literature. His *seliha*, or prayer for forgiveness, "Israel Is Redeemed by the Lord for an Everlasting Redemption," is still included in many Ashkenazic liturgies for the Day of Atonement. Shephatiah's son, Ami tai ben Shephatiah, succeeded him as head of the religious academy (*yeshiva*) of Oria and also as a poet of distinction. From these beginnings, there developed in Italy a rich tradition of both secular and religious Hebrew poetry. Schirmann (1934) contains representative works of more than fifty Italian Jewish poets from the ninth century to the fourteenth. Perhaps the most famous of these was Immanuel of Rome, whose *Mahberet Immanuel*, a collection of poetry organized according to the Arabic *maqama* (modes), is known for its innovative wordplay and ribaldry.

Shabbetai ben Avraham Donnolo was a tenth-century physician and theologian. He was born in Oria, was captured by pirates as a twelve-year-old boy, was ransomed by relatives, and then remained in southern Italy for the remainder of his life. His medical writings reflect his lifework as a physician and a pharmacist. Although he studied and copied many medical treatises composed in Greek and Latin, he wrote his own studies in Hebrew; in so doing, he apparently became the first person in Christian Europe to write on medicine in that language. His most prominent work is the medical treatise *Sefer Hamirkahot* (*Book of Remedies*); it contains more than 100 herbal remedies, with instructions for compounding them. His major work of theology is *Sefer Hakhmoni* (*Book of Wisdom*), a commentary on the mystical *Sefer Yetzirah*.

Historical writing and chronicles are another genre prominent in Italian-Hebrew literature. The anonymous *Sefer Josippon* (tenth century; Flusser 1981) is the earlier of the two examples that will be discussed here. It describes, in the main, the history of Judaea during the Second Temple era, concentrating especially on the rebellions of the Jews against the Roman empire. In this regard, it parallels the historical works of Josephus Flavius; however, it is not to be regarded as a translation or recension of Josephus. The author, who could read Latin but not the original Greek of Josephus, based his account on a Latin source that incorporated substantial amounts from Josephus's histories. A second important Italian-Hebrew chronicle is the *Scroll of Ahima'az*

(eleventh century; Mirkin 1965), written in rhymed prose by Ahimaaz ben Paltiel of Oria. The author's primary purpose is to recount the history of his prominent family over the previous two centuries; however, in doing this he also relates the history of the Jews of southern Italy.

The eleventh century also saw the publication of one of the most influential works of Hebrew lexicography of all time: *Arukh*, a dictionary of rabbinic Hebrew and Aramaic by Nathan ben Jehiel Anav of Rome. This author offers etymologies in addition to definitions, including words of Greek, Latin, and Persian origin. Moreover, he often explains whole passages, drawing on various exegetical traditions. As scholarship increased, *Arukh* was expanded many times; it was published in a critical edition in 1878-1892 by Alexander Kohut as *Aruch completum*.

Two thirteenth-century scholars were both named Isaiah. Isaiah ben Mali of Trani (the Elder) was an important halakhist, or scholar of talmudic and post-talmudic Jewish law. He wrote extensively on the entire range of talmudic and post-talmudic literature. His *pesakim* (legal decisions) generally contain a summary of the matter under consideration and a final conclusion regarding the various conflicting legal views among scholars who preceded him. *Tosafot R'ID*, his collection of *hiddushim* (novellas) on the Talmud was a related and very influential work, more exegetical in nature. He also issued legal *responsa*, wrote a commentary on the Pentateuch, and composed *piyyutim*, or religious poetry. He was the founder of a famous rabbinic family: his grandson, Isaiah ben Elijah of Trant (the Younger), also became a rabbinical scholar. Isaiah ben Elijah composed biblical commentaries on the Prophets and Hagiographa in addition to his own collection of talmudic novellas.

Menahem ben Benjamin Recanati (late thirteenth—early fourteenth century), the final scholar whose work we will consider here, is known primarily as a mystical exegete; his most important work is his commentary on the Pentateuch, although he also wrote other mystical treatises and a work of Jewish law. Not much is known about his life, but presumably he lived in the town in central Italy whose name he bears. Unlike other mystics, Menahem apparently did not claim to have received personal spiritual revelation. He synthesized and commented

on the work of other scholars, especially Moses Nahmanides, and drew as well on the classic works of the cabala such as *Zohar* and *Sefer Hababir*.

Italian Language

See Language, Italian: History and Development

Italian Literature: Religious

Writing on religious themes appeared at the beginning of the literary history of the Italian vernacular (1220s–1230s) and rapidly came to form by far the greater part of literary output in the peninsula during the following two centuries. The evidence of surviving wills, journals, and inventories, especially from the *Trecento*, strongly suggests that most of the relatively few individuals who owned personal copies of books or manuscripts were more likely to possess devotional or doctrinal works, in poetry or prose, than any of even the most famous secular literary works from the same period. However, the whole situation of religious literature in the Italian Middle Ages is profoundly complicated by issues of language (vernacular or Latin), genre (poetry or prose; lyric, narrative, didactic, devotional, hagiographic, oratorical, or dramatic), and audience (clerical or lay; elite or popular; male or female; literate or illiterate, in Latin or the vernacular or both). Generalizations based on romanticized hindsight and our often sadly scanty information about the material circumstances in which texts were produced and circulated are a more than usually treacherous guide to this rich and variegated body of writing.

Italian literary history is often said to have begun with the writings associated with Francis of Assisi and his circle in the 1220s—above all Francis's own *Laudes creaturarum* or *Cantico delle creature*, an almost pantheistic evocation of the unity of creation in rhythmic Umbrian prose. Before that, in the late twelfth century, writers were producing hagiographic material such as the *Ritmo di Sant'Alessio*, a poem in irregular stanzaic form in the vernacular of the Marche. The Franciscans were, however, probably the major driving force behind the diffusion of religious writing in the vernacular: they disseminated biographical material about Francis (a tradition that culminated in the

well-known fourteenth-century *Fioretti—Little Flowers—di san Francesco*); and Franciscans wrote original vernacular poetry, such as the extraordinary work of Jacopone da Todi (1230 or 1236-1306). Jacopone's outpourings of his intensely mystical response to the created world and the experience of divine love took the vernacular (in his case, Umbrian) to the limits of expressivity.

Francis and his order no doubt used the vernacular as a means of approaching, whether through written texts or orally (as in sermons), the large majority of the populace who knew no Latin. In this context, there also developed the most characteristic poetic genre of thirteenth-century religious literature, the *lauda*. Jacopone wrote many *laude*, and there are also scores of anonymous examples, especially from the cities of Umbria and Tuscany, where they were often collected into books called *laudari*. A *Lauda* is a vernacular text of praise and celebration, usually based on the (Latin) liturgy. It expresses communal devotion (thus *laude* were often recited or sung by the religious societies known as *confraternite*) and was intended, at least originally, for use in public worship. The most famous collection is the *Laudario di Cortona* (1260-1270), which, typically, contains texts dedicated to the Virgin, the Trinity, and Saint John, as well as meditations on death and judgment. Devotion to the Virgin also inspired many poetic versions of her *Planctus* or *Lamentatio* ("Lament"), especially in the vernaculars of central Italy, from the late twelfth century onward.

A phenomenon known as *volgarizzamento*—the translation or adaptation (or both) of Latin prose originals into vernacular versions—was also connected with a perceived need to reach out to a public literate in the vernacular but not in Latin. Large numbers of *volgarizzamenti* on religious themes survive from the thirteenth and fourteenth centuries, and many more were doubtless undertaken but have not survived. *Volgarizzamenti* include passages from and whole books of the Bible, lives of saints and religious leaders, moral and spiritual treatises, collections of proverbial wisdom, manuals of devotion, prayers, and sermons. Although the translators' aims and methods varied widely, as does the accuracy of their versions (at least by dubiously relevant modern standards), all the hundreds of works in this genre testify to the existence of a literate public eager to read in its own language the texts of the faith most of its members professed, and

presumably willing, in many cases, to make the not inconsiderable outlay of effort and expense necessary to acquire them.

Volgarizzamento was also of great importance for the technical development of vernacular prose writing; it offered its practitioners an opportunity to experiment with their new and as yet untried medium while drawing on the established authority and prestige of their Latin originals. Here too the Franciscans (and later the Dominicans) were in the forefront of literary activity. Many of the most active known *volgarizzatori* belonged to one or the other of the two great orders. Bartolomeo da San Concordio (d. 1347), for example, was a Dominican friar whose *Ammaestramenti degli antichi* (*Teachings of the Ancients*), a collection of moral and religious aphorisms, was extremely popular; his Latin *Summa casuum conscientiae* (*Encyclopedia of Moral Dilemmas*, 1338) was itself turned into many vernacular versions.

Volgarizzamento likewise encouraged the development of original narrative prose in the vernacular. The basic form of *Duecento* prose fiction, the *novella*, has clear affinities with the Latin *exemplum*, a short tale with a moral point frequently incorporated into a sermon or another religious discourse. Many collections of Latin *exempla* were subjected to *volgarizzamento* (for instance, by Bartolomeo da San Concordio), but it was not long before didactic and moralizing vernacular *novelle*, intended to inculcate a religious message, made their appearance. The tradition reached a peak in the fourteenth century with work of the Dominicans Domenico Cavalca and Jacopo Passavanti, whose dexterous use of storytelling techniques and forms for religious purposes has often been compared to that of their more overtly secular counterpart Boccaccio.

At the top of the literary and sociocultural scale in the *Duecento* was a genre of serious love poetry known as *poesia aulica*. Its practitioners, from the *scuola siciliana* onward, established the first and most durable literary canon in the Italian vernacular—albeit one whose popularity and influence, to judge from the evidence of surviving manuscripts and their diffusion, were confined to an extremely narrow social and intellectual stratum often consisting largely of the poets themselves. (*Poesia aulica* differed in this regard from much of the religious writing described above.) Although most *poesia aulica*, at least before the appearance of Cavalcanti and the *dolce stil nuovo* at the end of the

century, is clearly, often markedly, secular in tone and assumptions, some authors of *poesia aulica* did write religious poetry in the forms most often associated with it, especially the sonnet and the *canzone*. Foremost among these, perhaps, was Guittone d'Arezzo (c. 1230-1294). Guittone was acclaimed as a secular love poet before his dramatic conversion in the early 1260s, and thereafter as a lay Franciscan and a religious poet of uncommon vivacity and force.

The careers of two Florentines—Cavalcanti and Dante—changed the landscape of vernacular poetry at the end of the *Duecento* so thoroughly as to preclude any further neatly schematic distinction between religious and other genres. After Cavalcanti's work and Dante's *Vita nuova*, vernacular *poesia aulica* was pervaded (as in Dante's later lyrics and Petrarch's *Rerum vulgarium fragmenta*) not only with religious imagery and sentiment but with a clear sense that secular love, and its poetry, could acquire meaning only in a context defined by Christian faith. At the same time, the unprecedented achievement of Dante's *Commedia* redrew the boundaries of narrative poetry, blurring the distinction between religious and other genres even more, and adding complexity to questions of linguistic register and audience. Dante, true in this (as in much else) to his admiration for the Franciscans, seems to have chosen the vernacular for his *poema sacro* because it offered a chance to reach the widest possible public, literate or not. Religious writing in the *Trecento*, like every other kind of writing in the vernacular, was to be deeply marked by these developments at the turn of the century.

Most of the genres mentioned above continued to be practiced and elaborated during the fourteenth century. The *lauda* remained popular, especially among the Umbrian confraternities. It was frequently expanded from its devotional, hymnlike beginnings into a specifically dramatic form (*lauda drammatica*) in which biblical and hagiographic narratives are recounted in simple but effective structures. Religious lyric poetry continued to be written by Bianco da Siena (d. 1417), who was an admirer of Jacopone; by Cavalcanti; and by others. Dante's *Commedia* inspired many attempts at narrative-didactic poetry in a religious vein, such as Federico Frezzi's *Quadriregio* (1390s), an account—in seventy-four cantos in *terza rima*—of an otherworldly journey. *Volgarizzatori* were still active, and some of them, like Cavalcanti and

Passavanti, also made distinguished contributions to the growing tradition of original devotional prose in the vernacular. Similar contributions were made in vernacular preaching (Giordano da Pisa, d. 1311), mysticism (Ugo Panziera, died c. 1330; Simone da Cascia, c. 1295-1348; Giovanni Colombini, 1304–1367), devotional manuals (Agnolo Torini, c. 1315-1398; Girolamo da Siena, 1335 or 1340-1420), and hagiography (*Fioretti di San Francesco*).

Among the most consistently interesting aspects of medieval Italian vernacular religious writing is the involvement of women. This began very early: four letters by Saint Clare of Assisi (1193 or 1194-1253) are generally accepted as authentic, and other works are also attributed to her, though less securely. The participation of women continued throughout the *Duecento* and *Tre cento*. Examples include visionary works such as those of Angela da Foligno (1248 or 1249-1309), collected in *Liber de vera fidelium experientia* (*Book of the True Experience of the Faithful*), and Caterina (Benincasa) da Siena (1347-1380), who was the author of almost 400 letters and a mystical work, *Dialogo della divina Provvidenza* [*Dialogue of Divine Providence*, 1378]. But all these cases raise thorny questions of the type with which we began: attribution, literacy, language, genre, audience. Saint Clare, Angela da Foligno, and Caterina da Siena were such remarkable and famous women that what appear to be the writings of others were attributed to them. Angela learned to read but never to write, and Caterina learned to write only late in her short life; both of them (and probably Clare also) dictated their texts to (male) secretaries, who usually recorded the texts in Latin even if the dictation was in the vernacular. Thus the vernacular texts that then began to circulate as "by" Angela or Caterina were often in fact *volgarizzamenti* by unknown hands. Also, the work of all three women circulated among readers who, because they were literate, must have been overwhelmingly male. It is all too easy, and seriously misleading, to fall into the trap of anachronism and treat these women as women writers in a sense that would be comprehensible, or politically acceptable, today. Fascinating and rewarding as their "writing" always is, it exemplifies the need for accurate placement in context, careful reading, and cautious analysis—as well as heartfelt aesthetic admiration—that the vernacular religious writing of the Italian Middle Ages imposes on its modern students.

Italian Poetry: Comic

Comic poetry in the Italian vernacular, also known as jocose or realist poetry, first came into vogue in the second half of the thirteenth

century in Tuscany, where it flourished in the principal cities and towns. Italian comic poetry was a manifestation of the rich comic tradition found in Latin Goliardic poetry and all the major medieval Romance vernaculars; and it was strongly influenced by the poetry of the Provençal troubadours and the customs of the *giullari* (Old French *jongleurs*, or minstrels), the wandering entertainers of the Middle Ages. The initiators of the genre in Italy—Rustico Filippi of Florence and Cecco Angiolieri from Siena—wrote the most dynamic sonnets and established the canon that was followed by most other comic poets.

One unique feature of Italian comic poetry—with the exception of Meo dei Tolomei's *Caribetto* and Immanuel Romano's *Bisbidis*—is its almost exclusive use of the sonnet form. Comic poetry elsewhere is characterized by metrical variety, indicative of the influence of music in determining its form; by contrast, the metrical regularity of the Italian sonnet attests to its exclusively literary nature. However, comic poetry was probably recited in public from time to time, because many of the comic sonnets invoke an audience: examples include Rustico Filippi's *Volete udir vendetta smisurata* ("Do you want to hear about an outrageous vendetta"); Cecco Angiolieri's *Udite udite, dico a voi, signori* ("Listen, listen, I'm speaking to you, gentlemen"); and Jacopo da Lèona's *Segnori, udite strano malificio* ("Gentlemen, now hear a strange tale").

The large corpus of comic poetry is transmitted in the same Tuscan and Venetian manuscripts as contemporaneous serious poetry of courtly love. The three principal codices, all Tuscan, are in the Vatican Library. One of the earliest manuscripts, Vaticano Latino 3793, is the source of the sonnets by the first comic poets: Rustico Filippi, Jacopo da Lèona, and Mino da Colle. A later codex, Vaticano Barberino Latino 3953, compiled by Niccolò del Rosso between 1325 and 1355, is the principal source of lyrics by Cecco Angiolieri, Folgòre da San Gimignano, Cenne da la Chitarra, Immanuel Romano, Pietro dei Faitinelli, Parlatino da Firenze, Fino d'Arezzo, Giacomo dei Tolomei, and Giuntino Lanfredi. The poetry of Meo dei Tolomei and Nicola Muscia (Muscia da Siena) is found in Chigiano L.VIII.305, which dates from the mid-fourteenth century.

The integration of comic poetry with poetry of courtly love in the manuscript tradition offers valuable insights into the function and importance of the comic genre. Many poets wrote in both styles.

Among the poets best-known for their love lyrics who experimented with the comic style are Guido Guinizzelli (*Volvol te levi, vecchia rabbiosa*, "May a vulture carry you off, you wrathful old woman"), Guido Cavalcanti (*Guata, Manetto, quella scrignutuzza*, "Manetto, look at that scrawny woman"; *Novelle ti so dire, odi, Nerone*, "Nerone, listen, for I have some news for you"), and Dante (the *tenzone* with Forese Donati). Similarly, several poets known mainly for their comic sonnets also wrote love poetry: Rustico Filippi, Jacopo da Lèona, Cecco Angiolieri, and Pieraccio Tedaldi. Half of Rustico's fifty-seven sonnets treat the theme of love. If we examine the varied themes and modes of expression in comic poetry, we see that it offered an alternative to the ideals and the stylistic conventions of the courtly lyric. Clearly, toward the close of the thirteenth century in Tuscany, poets tended to be proficient in both types, demonstrating their versatility and their mastery of all aspects of their art.

Comic poetry is treated in the principal manuals of style, or *artes dictandi*, of the period. According to the principle of *conveniens* that forms the backbone of the *artes*, poets should use a middle or low style in writing comic poetry and reserve the elevated style for serious themes. Moreover, the dictates of *conveniens* stress that a humble style such as the comic is best suited to the common people, while people of importance merit an ornate, serious style.

Whereas the love lyric revolves around the *encomium* (praise) of the beloved, comic poetry exploits the *vituperium* (personal attack). The idealized world of the love lyric, populated by plaintive suitors and beautiful, gracious women, thrives on a language rich in hyperbole and abstract terms. Hyperbole is also one foundation of comic poetry; however, the language of comic poetry tends to be concrete and quotidian, and the protagonists are a motley crew. Although Italian comic poetry is an autonomous genre flourishing beyond the confines of the courtly lyric, it sometimes utilizes the conventions of love poetry as an object of satire. The old women depicted grotesquely by Rustico, Guinizzelli, Cavalcanti, and others make a mockery of reverent descriptions of the beloved. Cecco Angiolieri's courtship of the earthy and vocal Becchina is most humorous when read in conjunction with Dante's adoration of the "most gentle" Beatrice.

Rustico Filippi was the first to write a large group of comic sonnets.

These cannot be dated with certainty, but Rustico is known to have become famous in Florence for his poetry (presumably the humorous sonnets) between the years 1260 and 1266. His comic poetry can be grouped into two general categories—personal invective and caricature—and it served as a model for Jacopo da Lèona, Jacomo dei Tolomei, and the *tenzone* between Dante and Forese. Cecco Angiolieri's large corpus of comic sonnets was even more widely imitated. In addition to satirizing the love lyric, Cecco introduced two themes to the Italian comic tradition: the omnipotence of money and its counterpart, the misery of poverty. His sonnets in dialogue raised comic poetry to new heights of theatricality. One can discern Cecco's influence in the *canzonieri* of Meo dei Tolomei, Fino d'Arezzo, Giuntino Lanfredi, and Pieraccio Tedaldi. Mordant political poetry was a part of the comic tradition from its inception and was the specialty of Pietro dei Faintinelli, Folgòre da San Gimignano, and Parlantino da Firenze. Folgòre was also a master of the *plazer*, a genre of Occitanic origin that lists pleasurable things or activities. He used the *plazer* to evoke an idealized aristocratic lifestyle and to express, indirectly, his dissatisfaction with contemporary society. Many of the comic poets explored gnomic themes such as an upside-down world and the degenerate values of their society. These fragments of social commentary and sketches of daily life are an important document of the tenor of the times. In reading the Italian comic poets, one gains an appreciation for the thematic richness of the tradition, the expressiveness of the Tuscan vernacular, and the reality of daily life in the burgeoning medieval commune.

Anthologies in English translation that include the comic poets are Rossetti (1892), Smith (1985), and Tusiani (1974).

Italian Poetry: Lyric

The term "lyric poetry" refers, first, to relatively short poems that are meant to be set to music and sung; and, second, to poetic expressions of quintessential human emotions, such as the exaltation of love, virtue, and heroic qualities. Indeed, in his incomplete treatise *De vulgari eloquentia* (hereafter *DVE*), Dante speaks first of the qualities that define what would be the noble literary language for Italy, which he describes as *illustre, cardinale, aulicum, et curiale* ("illustrious, cardinal, courtly, and curial," *DVE*, 1.17.1); and second of the proper usage of this refined *koiné* in poetry—primarily in the *canzone* (ode) and, to a lesser degree, in the *ballata* and sonnet. The most noble subjects to be treated in this excellent language are prowess in arms (*salus*), love (*venus*), and moral virtue (*virtus*, *DVE*, 2.2.8). Dante's treatise on language and poetics also gives us insights on the poets he deemed the best of his general time period; they range from the Sicilian school in the first half of the thirteenth century to himself and his contemporaries at the end of the century. Among those represented are Giacomo da Lentini, Guido delle Colonne, Guido Guinizzelli, Guido Cavalcanti, and Cino da Pistoia. Dante is also very conscious of the earlier lyric tradition—the troubadours, in particular—and refers to some troubadours as exemplifying the heights to which lyric poetry had risen: Arnaut Daniel, Bertran de Born, Bernart de Ventadorn. On the other hand, only one *trouvère*—Thibault of Navarre—is cited for excellence in *DVE*.

This awareness of the earlier lyric tradition is also manifested in

Cantos 24 and 26 of *Purgatorio*, where Dante carefully delineates the historical development of lyric poetry in the thirteenth century. In Canto 24 he has Bonagiunta da Lucca refer to the earlier, pre-Dante poetic "schools" by naming their major exponents: Giacomo da Lentini the Notary (Sicilian school), Guitton d'Arezzo (the Guittonians), and Bonagiunta himself (the Siculo-Tuscan poets). In Canto 26 Dante has Guido Guinizzelli refer disparagingly to Guittone (verses 124-126), thus elevating the *do Ice stil nuovo* to a position of prime importance. In a related way, in *Purgatorio* 11 Dante has another of his characters, the artist Oderisi da Gubbio, speak of the vanity of earthly glory in reference to the succession of artists and poets: *Credette Cimabue ne la pittura I tener lo campo, e ora ha Giotto il grido, / sí che la fama di colui è scura. / Così ha tolto l'uno a l'altro Guido / la gloria de la lingua; e forse è nato / chi l'uno e l'altro caccerà del nido* (verses 94-99). Just as Giotto surpasses Cimabue in art, so will Guido Cavalcanti surpass Guido Guinizzelli in poetry—and the one who will "chase both out of the nest" is perhaps a thinly veiled allusion to Dante himself. Therefore, what emerges from Dante's works is a clear sense of historical periodization, of different literary generations, and of the dynamics of poetic interaction and development through the first century of Italian literature.

Some two generations after Dante, Petrarch discloses a very similar view of the earlier poetic tradition in his *Trionfo d'Amore* (*Triumph of Love*). In this allegorical dream vision, he views those souls conquered by love, and in the long procession are Italian poets from previous times:

*ecco Dante e Beatrice, ecco Selvaggia,
ecco Cin da Pistoia, Guitton d'Arezzo,
che di non esser primo par ch'ira aggia;
ecco i duo Guidi che già fur in prezzo,
Onesto bolognese, e i Ciciliani,
che fur già primi e quivi eran da sezzo;
Sennuccio e Francheschin, che fur sì umani
come ogni uom vide. (4.31-38)*

("There are Dante and Beatrice; there is Selvaggia; there are Cino da Pistoia and Guittone d'Arezzo who seems angry at not being first. There

are the two Guidos who were once much praised, together with Onesto from Bologna and the Sicilians, who once were first and now come last. There are Sennuccio and Franceschino who were as courtly as ever a man did see.")

By mentioning the names of the major Italian poets of love, Petrarca is able to trace, in broad outlines, the rise and development of the lyric tradition from its beginning with the poets of the Sicilian school through the achievements of the Tuscan-based Guittone d'Arezzo and the poets of the *dolce stil nuovo* to the innovations of his own contemporaries Sennuccio del Bene and Franceschino degli Albizzi. In some sense Cino da Pistoia, whom Dante praises as the poet of love par excellence in *DVE*, may be considered the poetic link between the world of Dante and that of Petrarch, who wrote a sonnet lamenting his death. However that may be, Dante and Petrarch viewed the development of lyric poetry in very similar ways.

Lyrical Forms

Lyric poetry in Italy was initially based on earlier (primarily Occitan, but also Old French and German) metrical forms, such as the *canzone* (Occitan *canso*), *sestina* (Occitan *coblas retrograda-das*), *tenzone* (Occitan *tenso*, although in Italy the sonnet was used as the basic strophic unit), and *discordo* (Occitan *descort*). Some popular forms—*strambotto*, *ballata*—were indigenous to Italy; others—sonnet, madrigal—came into being as new artistic inventions. Polyphonic music in France and Italy (*ars nova*) influenced the development of the *caccia* and the refinement of the *madrigale*. In *DVE*, Dante devotes the second of four projected books to the "art" of the *canzone*, which is, in his view, the most noble poetic form, the most perfect vehicle for treatment in the high, "tragic" style of the three most worthy topics noted above: prowess in battle, love, and moral virtue (2.2.8). The other two major forms—the *ballata* and sonnet—were described as more appropriate to the "middle" style of poetry (2.4.1). Imitating the troubadour Arnaut Daniel, Dante composed the first *sestina* in Italian. Other lyric forms—the madrigal, *caccia*, and *frottola*—did not make their appearance until

the fourteenth century.

Francesco Petrarca, *Sonetti Canzoni e Triomphi; con la Spositione di Bernardino Daniello da Lucca*. Venice: Per Pietro & Gioanmaria Fratelli de Nicolini da Sabio, ad istanza di M. Giombattista Pederzano, 1549. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

The Sicilian School

Italian lyric poetry began at the imperial court of Frederick II Hohenstaufen in Sicily in the first half of the thirteenth century— more

specifically, from 1220 to 1250. Court life was open and cosmopolitan, and a dynamic intellectual curiosity and activity permeated the atmosphere. This extraordinary environment fostered the literary enterprises of some fifteen to twenty individuals, most of whom were employed as civil servants in Frederick's bureaucracy. Although we know their names and have some indication of their role at court, we have very little biographical information about most of them. They composed their lyrics in Sicilian dialect and followed, by and large, the established models of poetic excellence provided by the troubadours, and to a lesser degree those of the *trouvères* and minnesingers. Love, or *fin'amors* ("noble" or "courtly" love), was the preferred subject matter of their poetry; and their presentation of the protagonists—lady and lover—and of the nature and the effects of passion follows conventional patterns. They would re-create in their lyrics the feudal setting with many elements of *fin'amors*: just as the lady became *mi dons* ("my lord"), the poet-lover became her faithful vassal whose selfless service was offered in the hope of winning her affection or some token thereof.

The first strophe of the following *canzone* by Rinaldo d'Aquino (who may have been falconer at Frederick's court and brother to Thomas Aquinas) reiterates several familiar themes: the extraordinary beauty of the woman, the exhilarating effects of love, the joy of "love-service," and the hoped-for reward for such service:

*Per fino amore vao sì letamente
ch'io non agio veduto
omo che 'n gioi mi possa aparigliare;
e paremi che falli malamente
omo c'à receputo
ben da segnore e poi lo vol celare.
Ma eo no lo celeragio
com 'altamente Amor m'à meritato,
che m'à dato a servire
a la fiore di tutta caunoscenza
e di valertza,
ed à belleze più ch'eo non so dire.
Amor m'à sormontato
lo core in mante guise e gran gioi n'agio.*

("Because of noble love I go about so happily that I have not seen a

man who can equal me in joy; and it seems to me that any man who has received a boon from his lord and wishes to hide it commits a grave error. But I will not hide how Love has rewarded me so richly, for he has given me to serve the flower of all courtliness and worth; she has more beautiful qualities than I know how to express. Love has enriched my heart in so many ways, and I derive great joy from this.")

Unlike many other lyrics of the Sicilian school, this *canzone* lacks the sadness and torment occasioned by unrequited love; indeed, it sings of the joy of the lover who fully expects to receive his just reward for service rendered to the lady under the tutelage of the god of love.

Another common theme is the tyranny of the god of love and the paradoxical nature of the amorous state, as expressed in the first stanza of this *canzone* by Guido delle Colonne (who was a judge at the imperial court):

*Amor, che longiamente m'hai menato
a freno stretto senza riposanza,
allarga le tue redini in pietanza,
chè soverchianza—m'ha vinto e stancato:
ch' ho più durato—ch'io non ho possanza,
per voi, madonna, a cui porto lianza,
più che non fa Assassino in suo cuitato,
che si lascia morir per sua credanza.
Ben este affanno diletto, amare
e dolce pena ben si può chiamare.
Ma voi, madonna, de la mia travaglia,
che sì mi squaglia,—prendavi mercide,
chè bene è dolce il mal se non m'ancide.*

("Love, who for a long time has led me with a tight bridle without rest, loosen your reins out of mercy, for your oppression has tired and conquered me: I have endured more than I can bear for you, my lady, to whom I am more faithful than the assassin in his belief, the one who allows himself to die for his faith. Loving is indeed a pleasant pain, and can be called a sweet sorrow. However, may you, my lady, have mercy on my torment that ruins me, for the pain is sweet unless it kills me.")

The Sicilian poets imitated earlier metrical forms, such as the *canzo*, and poetic devices, such as *coblas capfinidas* (a way of lining stanzas by repeating the same word at the end of one strophe and at the beginning

of the next), *coblas capcaudadas* (the repetition of the last rhyme in one stanza as the first in the subsequent stanza), and *coblas unissonans* (the use of the same rhymes in each strophe). Moreover, they followed the convention of using a code name (*senhal*) for the lady to keep her identity secret, and they embraced many of the major themes of the troubadours. In all this, the Sicilians borrowed generously from the Occitan lexicon of amorous expressions, italianizing them and thus establishing the basis of the new lyrical language. Words such as *intendanza* (love), *amanza* (love), *drudo* (lover), *sollazzo* (pleasure), *gioia* (joy), and *coraggio* (courage and heart) disclose their etymology. Despite these extensive borrowings, the poets of the Sicilian school demonstrated their artistic independence in other ways. New lyrical forms emerged to replace the trite imitations of earlier models, as well as new images and concepts. Therefore, although they initially shared many traits with the earlier tradition, the Sicilian poets achieved a state of predominance and self-sufficiency. Indeed, we might characterize the poetic production of the Sicilian school as a harmonious blending of the complementary principles of imitation and innovation.

The notary Giacomo da Lentini was the most prolific and inventive poet of the *scuola poetica siciliana*, and it was probably because of his prominence that Dante, in *Purgatory*, designated him as the "leader" of this school. Giacomo's large poetic corpus consists of fourteen *canzoni*, one *discordo*, and at least twenty-five sonnets. Giacomo discloses his debt to the rich Occitanic heritage and, at the same time, demonstrates his particular inventiveness through his use of natural images, scholastic argumentation, and local allusions, as well as through his concern with the role and craft—the "art"—of the poet.

In the first two strophes of Giacomo's *canzone Meravigliosamente*, we may observe how he uses specific traditional motifs—the servitude of love, the necessity of secrecy in matters of love, the importance of the heart as the affective center of love, and the poet as artist:

I

*Meravigliosamente
un amor mi distringe
e sovenmi ad ogn'ora;
com'omo che ten mente
in altra parte, e pinge*

*la simile pintura,
così, bella, facc'eo:
dentro a lo core meo
porto la tua figura.*

II

*In cor par ch'eo vi parte
pinta como parete,
e non pare di fore,
O Deo, co mi par forte!
Non so se lo savete
com'io v'amo a bon core;
ca son sì vergognoso
ch'io pur vi guardo ascoso
e non vi mostro amore.*

(I. Wondrously a love seizes me and is constantly in my mind; like the man whose mind is elsewhere and paints the likeness of that which he is imagining, so do I, my beautiful one: I bear your image within my heart." II. "It seems I have you in my heart, painted as you appear, but this does not appear outwardly. O God, how harsh this seems to me! I do not know if you know that I love you loyally, for I am so shy that I look at you covertly and do not manifest my love to you.")

In one *canzone*, *Amor non vole ch'io clami* ("Love does not want me to call"), Giacomo voices his apparent dissatisfaction with the limitations posed by slavish imitation of troubadour models. Here he proclaims his desire to avoid stylized amorous conventions and to shape his poetry along more innovative lines. This *canzone* seems to be a sort of poetic declaration of independence, in which Giacomo grapples with the problem of poetic virtuosity and originality and states that he will not continue to write in a traditional, conventional manner. It may even foreshadow Giacomo's most important contribution to western literature, the sonnet, a poetic form that was perhaps invented in protest against the artistically stifling influence of the troubadour tradition.

Among Giacomo's many sonnets, *Lo giglio quand'è colto tost'è passoy* through its use of natural images and *traduction* is a good example of the union of technical virtuosity and amorous content:

*La giglio quand'è colto tost'è passo,
da poi la sua natura lui no è giunta:
ed io, dacunque son partuto un passo
da voi, mia donna, dolerni ogni giunta,
perché d'amare ogni amadore passo,
in tante altezze lo mio core giunta:
così mi fere Amor, lavunque passo,*

*com'aghila quand'a la caccia è giunta.
Oi lasso me, cbe nato fui in tal punto,
c'unque no amasse se non voi, Chiù gente!
Questo saccio, madonna, da mia parte:
in prima che vi vidi ne jui punto,
serviivi ed inoraivi a tutta gente,
da voi, bella, lo mio core non parte.*

("The lily when plucked soon withers, since it is no longer joined to its source of life, and whenever I am only minimally separated from you, my lady, every joint in my body aches; because I surpass every lover in loving, my heart reaches great heights: Love strikes me wherever I go, just as the eagle when it seizes its prey. Oh, woe is me who was born in such a state that I would never love anyone but you, most gracious one! This I know, my lady, from my own experience: as soon as I first saw you I was struck, I have served and honored you before all people, from you, beautiful one, my heart will not depart.")

The equivocal rhymes inform both the structure and the meaning of this sonnet with uniformity (the same rhyme words) in diversity (the different meanings of these words): the poet's single devotion to his lady is expressed through diverse external allusions (the plucked lily, the eagle that swoops down to seize its prey). Just as the lily cut from its stem withers and dies, so the lover separated from his lady, his source of life and inspiration, is racked with pain; and just as the eagle seizes its victim, so love inflicts wounds on the lover. In their presentation of the two complementary aspects of violence—tearing apart (the lily) and forceful union (the eagle)—the natural images in the first eight lines describe the anguish experienced by the lover whether far from or near to the object of desire. The final six verses contain the lament of the lover whose destiny (he was "born" to love only her) is to

remain in her thrall; his life is one of complete dedication, faithfulness reinforced by the final declaration that his heart will never stray or be separated from her.

Other noteworthy Sicilian poets include the emperor Frederick II, his illegitimate son Enzo, Pier della Vigna (the emperor's faithful secretary and logothete), and Giacomino Pugliese, whose poetry ranges between the courtly and decidedly more popular registers and alternately celebrates and laments a vibrant, sensual passion.

Alongside the generally refined and noble courtly lyrics of the Sicilian poets we find more popular rhymers, such as Compagnetto da Prato and Cielo d'Alcamo. The subject of Cielo's well-known *contrasto*, *Rosa fresca aulentissima*, is a dialogue, in the *pastourelle* mode, between a woman of the bourgeoisie and an itinerant jongleur. In this lively poem we find a delicious mixture of courtly and rustic language that contributes to the realistic nature of their dialogue. In addition to the psychological interplay between the two interlocutors, the *contrasto* brilliantly demonstrates how language can either convey or mask inner feelings.

The Italian lyric was born in Sicily, and these poets thus hold a place of prime importance in the history of Italian literature. Not only were they the first to use the Italian vernacular in an organized fashion as a medium for artistic expression, but through innovative imitation of earlier models they succeeded in compiling a rich and influential body of literature and also invented the sonnet, which would in time become the poetic vehicle par excellence in Italy and throughout Europe.

The Imitators of the Sicilian School

The lyrics of the Sicilian school were imitated by poets in the prosperous city-states of central Italy, especially in Tuscany. These continuators of Occitan and Sicilian modes have come to be known as the Siculo-Tuscans; they include Inghilfredi, Bondie Dietaiuti, Maestro Francesco (who probably composed the first double sonnet), and the Compiuta Donzella of Florence, the first Italian woman poet. In her two sonnets, Compiuta Donzella voices the complaint of a young woman whose father wishes her to marry against her will (*A la stagion che 'l*

mondo foglia e fiora) and who hopes to avoid this undesirable situation by taking religious vows (*Lasciar vorria lo mondo e Dio servire*). The first sonnet contains the conventional description of the advent of spring (*Natureingang*) and the consequent awakening of all nature to the joy of love, an emotion not shared by the "I" of the poem. The second sonnet laments the evil rampant in the world and presents the protagonist's noble desire to eschew these vanities for a life dedicated to God.

The most important Siculo-Tuscan poet is Bonagiunta Orbicciani, a notary from Lucca, whose lyrics (eleven *canzoni*, five *ballate*, two *discordi*, and eighteen sonnets) demonstrate both formal and thematic diversity. He is an intermediary in every sense of the word, not only between the Sicilian and Guittonian schools but also between Guittone and the poets of the *dolce stil nuovo*. Indeed, in Canto 24 of *Purgatory* Dante acknowledges Bonagiunta's pivotal role in this development. In that episode Dante has Bonagiunta comment on the several poetic schools and recognize Dante (whom he identifies as the author of the *canzone Donne ch' avete intelletto d'amore*—"Ladies who have understanding of love") as the most innovative poet of the age. In retrospect, Bonagiunta can say: .. . *issa vegg'io, . . . il nodo / che 'l Notaro e Guittone e me ritenne / di qua dal dolce stil novo ch'i'odo* ("now I see the knot that kept the Notary and Guittone and me from the sweet new style that I hear," verses 55-57). Bonagiunta's love poetry is replete with natural images and characterized by a freshness of sentiment, an immediacy, and a directness that contrast with the abstract discussions and rhetorical elegance of the earlier traditions.

Guittone d'Arezzo and His Followers

Writing in mid-century, Guittone d'Arezzo (c. 1230-1294) was the most important literary figure of his generation. He had many followers, the so-called Guittoniani, who were avid but arid imitators of their Occitan and, to a lesser degree, Sicilian forerunners. Their desire to achieve formal elegance and rhetorical and linguistic virtuosity in their poetry renders much of their work inaccessible, unintelligible, or uncongenial (at least to modern readers). Nevertheless, Guittone contributed to the

development of the lyric tradition by expanding his repertoire to include not only amorous but also moral, religious, and political subjects. In this, his lyrics show the heavy metrical, verbal, and thematic influence of the troubadours and the Latin rhetorical tradition; moreover, they bear the mark of his bourgeois culture and his direct experience with life in the Italian communes. The audience for his poetry was no longer the aristocracy, the landed nobility, or the imperial court, but rather the merchant class of the central Italian communes.

Guittone's large poetic production (fifty *canzoni* and 251 sonnets) may be divided chronologically into two groups: the early love lyrics and the later moral-religious poetry. The poetry in the first group draws considerably on troubadour themes, language, style, and syntax. Guittone was attracted to the style known as *trobar clus* (i.e., hermetic poetry) and the elaborate style of the *trobar ric* (i.e., especially ornate poetry). He also used many local words and expressions, thereby forging a new, composite language. The extensive "municipal" vocabulary in Guittone's poetry was one reason for Dante's negative appraisal in *De vulgari eloquentia* (1.13.1). However, Guittone's use of the vernacular for a high, serious treatment of political and ethical topics marks a major advance in the development of Italian literature. His *canzone* on the defeat of the Florentine Guelfs at the battle of Montaperti in 1260 (*Ahi lasso, or è stagion di doler tanto*) demonstrates his ability to write in a sublime, tragic style.

One good example of Guittone's particular brand of poetry is the following sonnet, in which he elaborates on the *word gioia* (joy):

*Tuttor ch'eo dirò gioi', gioiva cosa,
intenderete che di voi favello,
che gioia sete di beltà gioiosa
e gioia di piacer gioioso e bello:
e gioia in cui gioioso avenir posa,
gioi' d'adomezze è gioi' di cor asnello;
gioia in cui viso è gioi' tant'amorosa,
ched è gioiosa gioi' mirare in ello.
Gioi'di volere e gioi' dispensamento
e gioi' di dire e gioi' di far gioioso
egioi' d'onnigioioso movimento.*

*Perch'eo, gioiosa gioi', sì disioso
di voi mi trovo, che rnaì gioi' non sento,
se 'n vostra gioi' il meo cor non riposo.*

("Whenever I say joy, joyous one, you will know that I speak of you, who are the joy of joyous beauty, and the joy of joyous and beautiful pleasure. You are the joy in which a joyous future resides, the joy of riches and the joy of a lovely heart; the joy in whose face is such amorous joy that it is joyful joy to look upon it. Joy of desire and joy of meditation, and joy of speaking and joy of rejoicing, and joy of every joyful movement. For these reasons, joyous joy, I am so enamoured of you that I will never experience joy unless I place my heart in your joy.")

The poem is unified thematically by the presentation of Guittone's amorous "joy" (*gioia* in its several forms is repeated twenty-two times), an emotion that is both a function and a direct correlative of the lady (*gioiosa gioi'*) herself.

The impact of Guittone's literary production may be measured in part by his numerous imitators—the Guittonianians—who followed his lead in highly artificial and formally difficult poetry, characterized by often intricate internal and end rhyme patterns and by elaborate plays on words. It would appear that the Guittonianians considered intentional obscurity a sign of greatness; indeed, these qualities do seem to define the poetry of Panuccio del Bagno, Meo Abbracciavacca da Pistoia, and others among Guittone's disciples. One of them, the Florentine Monte Andrea, is often singled out for his technical virtuosity; he perfected what was probably Guittone's invention—a modified sixteen-line sonnet whose first part has ten lines in alternating rhyme (ABABABABAB), instead of the usual eight—incorporating it in some 100 sonnets. In poetic exchanges with Guittone and others, Monte often shows a distinct preference for difficult and unusual verbal and metrical techniques.

The Transitional Poets

Some of Guittone's early followers moved away from his rhetorical and

linguistic bombast, arduous hermetic stylizations, and cold conventions. One of these is Dante da Maiano, whom critics generally classify as a Guittonian because of his use of internal rhymes, ornate language, and sometimes disjointed syntax. Despite this label, Dante da Maiano demonstrates an even greater affinity with the Sicilians and the Occitan poets of the *trobar leu* (i.e., elegant, readily understandable poetry). He and Paolo Lanfranchi da Pistoia were the first Italian poets to compose sonnets in the *langue d'oc*.

Another intermediary figure—perhaps the most important— was the Florentine poet Chiaro Davanzati, whose poetic production numbers some sixty *canzoni* and 120 sonnets (many in *tenzoni* with Monte Andrea, Dante da Maiano, and others). Chiaro's lyrics, unlike those of the Guittoniani, have very few stylistic encumbrances and are thus free-flowing and easily comprehensible. The following sonnet shows his indebtedness to the earlier Sicilian and Occitan *trobar leu* traditions and also, through its concentration on the luminescent qualities of the lady, anticipates a major theme of the poets of the *dolce stil nuovo*:

*La splendïente luce, quando apare,
in ogni scura parte dà chiarore;
cotant'ha di vertute il suo guardare,
che sovra tutti gli altri è 'l suo splendore:
così madonna mia face alegrare,
mirando lei, chi avesse alcun dolore;
adesso lo fa in gioia ritornare,
tanto sormonta e passa il suo valore.
E l'altre donne fan di lei bandiera,
imperadrice d'ogni costumanza,
perch' è di tutte quante la lumera;
e li pintor la miran per usanza
per trare asempro di sì bella cera,
per fame a l'altre genti dimostranza.*

("When the brilliant light appears, it illuminates every dark place; so powerful is her gaze that its luminosity surpasses all others: thus my lady gladdens any suffering one who simply gazes upon her; she rapidly returns him to a joyous state, so superior is her power. And other women make her their leader, the empress of all courtliness, for she is their light; and painters are accustomed to gaze upon her and to

take her beautiful face as the model of their art, thus making her beauty known to everyone.")

The Dolce Stil Nuovo ("Sweet New Style")

The phrase *dolce stil nuovo* is commonly used (1) to designate a loosely organized group of late thirteenth-century love poets and (2) to describe the special character of their lyric production, that is, a style (*stil*) that is audibly and intellectually pleasing (*dolce*) and innovative (*nuovo*) in concept and manner. The phrase originates in Canto 24 of Dante's *Purgatory*, during a conversation between the pilgrim Dante and the poet Bonagiunta da Lucca. Bonagiunta addresses Dante, calling attention to his special poetic qualities and then referring to the difference between Dante's poetry and that of earlier poets, himself included. Bonagiunta begins: *Ma dì s'i' veggio qui colui che fore / trasse le nove rime, cominciando / "Donne ch'avete intelletto d'a-more"* ("But, tell me, if I see here the one who brought forth the new rhymes, beginning 'Ladies who have understanding of love?'"). Dante responds: *I' mi son un che, quando / Amor mi spira, noto, e a quel modo / ch'e'ditta dentro, vo significando* ("I am one who, when Love inspires me, takes note, and following that way he speaks within me, I express my thoughts"). Bonagiunta then elaborates: *Ofrate, issa veggio.. . il nodo / che 'l Notaro e Guittone e me ritenne / di qua dal dolce stil novo ch'i' odo! / Io veggio ben come le vostrepenne I di retro al dittator sen vano strette, / che de le nostre certo non avvenne* ("O brother, now I see the knot that kept the Notary and Guittone and me from the sweet new style that I hear. Now I do indeed see how your wings [quills] fly [move] after the one who dictates, something that did not happen with ours.") In this passage the phrase *dolce stil nuovo* remains ambiguous: it may refer either to an entire group of poets or to Dante alone. Nevertheless, this indication of a new poetic style clearly does correspond to the poetic revolution begun by Guido Guinizzelli and to its eventual maturation and complete expression in Dante.

In the third quarter of the century Guinizzelli (c. 1230 or 1240-1276), a Ghibelline judge from Bologna, began to write poetry under the influence of Guittone (see the sonnet addressed to him, *O caro padre*

rrtio) but soon he changed his style and composed lyrics (five *canzoni* and fifteen sonnets) that varied greatly from those of his predecessors in style, theme, and conception. In a well-known *tenzone*, Bonagiunta reproved Guiniz zelli as the one who had *mutata la mainera / de li piacenti ditti dell'amore / de la forma dell'esser là dov'era* ("changed the manner of the pleasing songs of love from their earlier forms"). Guiniz-zelli's sonnet in response—*Om ch'è saggio non cone leggero* ("A wise man does not run rapidly")—is a gentle put-down of the older, more traditionally-minded poet. Guinizzelli played a key role in the transformation and renewal of the Italian lyric tradi tion and has therefore been been recognized as the father of the *dolce stil nuovo*. For him, the praise of the lady's divine beauty and miraculous qualities is the primary characteristic of *stilnovismo*, as the following sonnet attests:

*Io voglio del ver la mia donna laudare
ed asembrarli la rosa e lo giglio:
più che Stella diana splende e pare,
e ciò ch'è Lassù bello a lei somiglio,
Verde river' a lei rasembro e l'are,
tutti color di fior', giano e vermiglio,
oro ed azzurro e ricche gioi per dare:
medesmo Amor per lei rafina meglio.
Passa per via adorna, e sì gentile
ch'abassa orgoglio a cui dona salute,
e fa 'l de nostra fé se non la crede;
e no. lle pò apressare om che sia vile;
ancor ve dirò c'ha maggior vertute:
null' om pò mal pensar fin che la vede.*

("I truly wish to praise my lady arid to compare her to the rose and lily: more than the morning star she shines and comes into view, and all that is beautiful in the heavens I compare to her. I compare her to the verdant river bank and the gentle breeze, all colors of flowers, yellow and red, gold and blue and precious stones worthy of being given: through her Love achieves greater perfection. In noble attire she goes along the street, and so graciously that she overcomes pride in those to whom she gives both greeting and salvation, and she converts unbelievers to our faith; no ignoble man can even approach her;

moreover, I say to you that she has an even greater power: no one can think evil thoughts in her presence.")

In his doctrinal *canzone Al cor gentil rempaira sempre amore* ("Love always has its home in the noble heart"), Guinizzelli attempts to resolve difficult questions concerning the nature of human nobility (*gentilezza*), the role of the woman in the amorous relationship, and the purpose and meaning of earthly love. Contrary to traditional wisdom, *gentilezza* is not determined by a person's wealth, or family, or any other external circumstance; rather, it is a consequence of one's innate qualities. Therefore, the capacity or disposition to love purely and nobly is reserved for those to whom nature has given a *cor gentil* (noble heart). No longer a passive object of desire, Guinizzelli's lady is an active force, who assumes in the elaborate system of analogies of the *canzone Al cor gentil* power and status equal to those of God. In this manner the woman is responsible for activating in her admirer that inborn potentiality to love; indeed, Guinizzelli's woman becomes a true *donna angelicata* (angelicized woman), similar to the angelic intelligences who move the eternal spheres. Given the philosophical pretensions and the numerous metaphysical parallels and analogies of the *canzone*, Guinizzelli probably wanted to ennoble human love by transforming it into a sort of secular *caritas*. However, that project proved to be too ambitious, for he concludes the poem on a humorous note. In the last strophe of the *canzone*, Guinizzelli imagines that, after death, he is being judged by God, who rebukes him for having dared to use the deity as a term of comparison for a vain, earthly love (*vano amor*):

*Donna, Dio mi dirà: "Che presumisti?"
siando l'alma mia a lui davanti;
"Lo ciel passasti, e 'nfin a me venisti,
e desti in vano amor Me per sembranti:
ch'a Me convèn la laude,
e a la Reina del regname degno,
per cui cessa onne fraude."
Dir Li porò: "Tenne d'angel sembianza
che fosse del Tuo regno:
non me fu fallo, s'in lei posi amanza."*

("My lady, God will ask me, when my soul stands before Him, 'What

presumption is yours? You passed through the heavens and came to My presence and used Me as a comparison for a vain love. All praise belongs to Me and to the Queen of this worthy realm, through whom all fraud ceases.' I will be able to answer Him: 'She looked like an angel from Your kingdom: it was not my fault that I loved her.' ")

Despite his failure to reconcile human affection for woman and divine love for God, Guinizzelli clearly indicated a new direction in amorous poetry. Dante would eventually turn to this model in *Vita nuova* (*New Life*) and in the *Divine Comedy*, where Beatrice becomes his personal bearer of spiritual salvation (*salute*), thus fulfilling the lofty but unrealized aspirations of Guinizzelli and representing the supreme achievement of the *dolce stil nuovo*.

One of the most distinctive poetic voices of the *dolce stil nuovo* is the Florentine Guido Cavalcanti (c. 1259-1300), whom Dante (in *Vita nuova*) calls his "first friend" and who was an active participant in the factional strife that plagued Florence. Except for a few compositions, his lyrics (some fifty-two poems in all) do not follow Guinizzelli's example. Cavalcanti is obsessed with the psychology of love, and in his poems he represents, externalizes, the inner struggle of the soul afflicted by contrasting emotions, which are personified as *spiritelli* ("little spirits"). The tragic, mournful quality of his lyrics attests to the mental and physical anguish induced by love and often reflects the abject state of the lover, as in the following sonnet—which also marks a new development in the history of the form:

*L'anima mia vilment' è sbigotita
de la battaglia ch'ell'ave dal core:
che sella seme pur un poco Amore
più presso a lui che non sole, ella more.
Sta come quella che non ha valore,
ch'è per temenza da lo cor partita;
e chi vedesse com' ell' è fuggita
diria per certo: "Questi non ha vita."
Per li occhi venne la battaglia in pria,
che ruppe ogni valore immantenente,
sì che del colpo fit strutta la mente.
Qualunqu' è quei che più allegrezza sente,
se vedesse li spirti fuggir via,
di grande sua pietate piangeria.*

("My soul suffers harsh anguish because of the battle the heart wages on it: if it senses that Love is closer to it than normal, it will die. It remains as one that has no power and is through fear separated from the heart; whoever would see how it has fled would say for certain: 'This one is not alive.' The battle first came through the eyes and immediately broke down all resistance, so that the mind was devastated by the blow. Whoever may be in a state of great happiness, if he were to see my spirits fleeing, he would weep from pity.")

This intentionally asymmetrical and unique rhyme scheme (ABBB BAAA CDD DCC) is the metrical counterpart of the emotional disequilibrium, the disordered state of the poet-lover's existence brought about by love. Without resorting to either fragmented syntax or harsh language, Cavalcanti is able to convey a sense of imbalance through subtle manipulation of the rhyme scheme. As is customary, the poet-lover's amorous affairs are acted out with "real" characters, the personifications of his soul, mind, and heart.

Cavalcanti's doctrinal canzone *Donna me prega* is structured along the lines of a philosophical and scientific treatise and is intended to be a sort of scientific proof (a *natural dimostramento*) that defines the origin, nature, and effects of love. The first stanza of the *canzone* announces the several questions about love that it will seek to resolve:

*Donna me prega,—per ch'io voglio dire
d'un accidente—che sovente—è fero,*

*ed è sì altero,—chè chiamato amore:
sì chi lo nega—possa 'l ver sentire!
Ed a presente—conoscente—chero,
perch'io no spero—ch'om di basso core
a tal ragione porti canoscenza:
chè, senza—natural dimostramento
non ho talento—di voler provare
là dove posa, e chi lo fa creare,
e qual sia sua vertute e sua potenza,
l'essenza—poi e ciascun suo movimento,
e 'l piacimento che 'l fa dire amare,
e s'omo per veder lo pò mostrare.*

("A lady beseeches me, and therefore I am willing to treat of an *accident* that is often fierce, and yet so majestic, which is called Love: so that those who disbelieve in it may hear the truth. And now I require an intelligent audience, because I have no hope that people of inferior quality can muster sufficient understanding for a discussion of this kind. For I am not inclined to try, without scientific exposition, to demonstrate where it resides, and who brings it into existence, and what its virtue and its power are, and then its essence and all its movements, and the attraction that earns for it the name of loving, and whether one can show it so that it can be seen"—trans. J. E. Shaw.)

Although the exact meaning and sources of this *canzone* are still a subject of much debate, certain points emerge as valid: the lover, gazing on a real woman, formulates within himself his own idea of beauty, and this ideal conception then completely dominates his mind, causing him to strive anxiously and ceaselessly to obtain its earthly manifestation—that is, a real woman. The anguish and torment of this vain pursuit (vain because the real can never measure up to the ideal) ultimately deprive the lover of reason and cause death. Cavalcanti's poetry, for the most part, has as its subject the externalization, with appropriate personifications, of this inner struggle.

Although the reputation of Italy's greatest poet, Dante Alighieri (1265-1321), is based primarily on the *Divine Comedy*, his minor poems (fifty-nine sonnets, twenty-one *canzoni*, six *ballate*, one *sestina*, and one "double *sestina*") were certainly important to the development of lyric poetry. Dante collected and ordered a number of his early poems in *Vita nuova*, where, through a unique combination of poetry and prose, he tells the story of his love for Beatrice. In the first part of *Vita nuova*, he discloses Cavalcanti's influence by being attentive to the dire and debilitating effects of love on the person and mind. Recognizing the essentially selfish, counterproductive nature of this sort of poetry, however, he turns in the second part of the work to the Guinizzellian poetics of praise, announcing this change in the *canzone* *Donne ch'avete intelletto d'amore*. In this portion of *Vita nuova* the sonnet in praise of Beatrice, *Tanto gentile e tanto onesta pare*, best summarizes the essence of the *dolce stil nuovo* and, more particularly, of Dante's own special contribution to the lyric tradition. It is perhaps his finest poem, because

of its flowing musical quality combined with the lofty theme of praise:

*Tanto gentile e tanto onesta pare
la donna mia quand' ella altrui saluta,
ch'ogne lingua deven tremando muta,
e li occhi no l'ardiscon di guardare.*

*Ella si va, sentendosi laudare,
benignamente d'umiltà vestuta,
e par che sia una cosa venuta
da cielo in terra a miracol mostrare.
Mostrasi sì piacente a chi la mira,
che dà per li occhi una dolcezza al core,
che 'ntender no la può chi no la prova;
e par che de la sua labbia si mova
un spirito soave pien d'amore
che va dicendo a l'anima: "Sospira!"*

("Such sweet decorum and such gentle grace / attend my lady's greeting as she moves / that lips can only tremble into silence, /and eyes dare not attempt to gaze at her. / Moving, benignly clothed in humility, / untouched by all the praise along the way, / she seems to be a creature come from Heaven / to earth, to manifest a miracle. / Miraculously gracious to behold, / her sweetness reaches, through the eyes, the heart / —who has not felt this cannot understand—, / and from her lips it seems there moves a gracious / spirit, so deeply loving that it glides / into the souls of men, whispering: 'Sigh!' "—trans. Mark Musa.)

In *De vulgari eloquentia* (DVE, 2.2.9) Dante refers to himself as the most excellent poet of rectitude; here he is undoubtedly alluding to the moral *canzoni* contained in his incomplete philosophical treatise, *Convivio* (*The Banquet*). In the poems generally known as the *rime petrose* (rocky rhymes) because of the harsh, cruel nature of their addressee, the *Donna Petra* (stony lady), he gives much evidence of his artistic talents. In them, he both imitates and attempts to outdo his Provençal mentor, Arnaut Daniel, by composing the first Italian *sestina*, *Al poco giorno e algran cerchio d'ombra* ("To the shortened day and to the great circle of shade"—trans. Robert Durling), and by formulating what might be called a "double" *sestina*-. *Amor, tu vedi ben che questa donna* ("Love, you see perfectly well that this lady"—trans. Robert

Durling).

Most of Dante's lyrics were written in the early stages of his literary career, during that necessary training period before the composition of the *Divine Comedy* when he experimented with traditional forms and ideas. These traditional elements he ultimately rejected or substantially reworked in his quest for and attainment of poetic excellence. In this larger context, then, Dante's lyrics stand as important signposts on his literary *iter*, or journey, which would culminate in the writing of the *Divine Comedy*.

Another major exponent of the *dolce stil nuovo* is Cino da Pistoia (c. 1270-1336 or 1337), who was a good friend of Dante and a celebrated lawyer and teacher of law. Cino's lyric production (134 sonnets, twenty *canzoni*, and thirteen *ballate*) is the largest of the *stilnovisti* and reflects virtually all their major themes, images, and concepts. The following sonnet demonstrates certain characteristics of his lyric voice:

*Deh, non mi domandar perché sospiri,
ch'i' ho testé una parola udita,
che l'anima nel corpo è tramortita
e svariati tutti miei desiri.
Parmi sentir ch'oma' la morte tiri
a fine, lasso, la mia greve vita:
fuor de la terra la mia donna è gita
ed ha lasciato a me pene e martiri.*

*Seco ha 'l meo core, e' miei occhi smagati
rimasi son de la lor luce scuri,
sì ch'altra donna non posson guardare;
ma credendoli un poco rappagare,
veder fo loro spesso li usci e' muri
de la contrata u' sono 'nnamorati.*

("Please, don't ask me why I sigh, for I have just now heard some talk because of which the soul in the body is slain and all my desires are changed. I think I feel that death now brings, alas! my sad life to an end: my lady has gone out of the city and left me with torment and pain. She has my heart with her, and my bewildered eyes are bereft of their light, so that they cannot look at any other lady. But thinking to give

them some small satisfaction, I have them often look at the doors and the walls of the place where they fell in love.")

The political vicissitudes of Pistoia and the consequent exile of individuals and families form the background for this amorous lament. In addition to the mournful quality of these verses—which reflects their intensely personal, almost confessional nature—we find a spatial orientation that is unprecedented in the Italian lyric tradition. Here Cino remembers the lady and their love in connection with his seeing and visiting her home. Far from the conventional and abstract recall of the time and place of the lovers' first meeting, this sonnet underlines the power that a particular place has to evoke a mood and generate ideas.

Cino's contribution to the development of lyric poetry lies both in his harmonizing of various themes and concepts and in his objective psychological realism. For these reasons, he is generally considered the bridge linking the "sweet new style" and Petrarch.

The minor members of the *dolce stil nuovo* reflect in diverse ways certain of its aspects: Dino Frescobaldi and Gianni degli Alfani followed the Cavalcantian tragic manner, and Lapo Gianni wrote highly refined *batlate*, which, reverting to the older tradition, earned the admiration of Dante (*DVE*, 1.13.4).

The identifying traits of the *dolce stil nuovo* are (1) the theme of praise that transcends the secular adoration of woman; (2) the presentation of the lady, who has both the appearance and the role of an angel (to lead the poet to spiritual salvation); (3) the concept of love as a force that may bestow either supreme happiness (beatitude: Guinizzelli, Dante, Cino) or unbearable anguish (death: Cavalcanti, Gianni degli Alfani). In short, the poets of the *dolce stil nuovo* radically changed the lyric tradition, by freeing poetry thematically from the events of daily life, by elevating it linguistically above the common parlance, and by forging a new poetic language based on those terms that were central to their new understanding of love and that infused the conventional amorous vocabulary with new life and meaning: *dolce*, *spirito*, *spirare*, *gentile*, *salute*, *virtù*, *onestà*, *mercede*, *valore*, *soave*, and so on. Although each poet has his own special language and attitudes, together they represent, with their refined lyricism, richness

of poetic techniques, acute awareness and investigation of human psychology, and profound spiritual sensitivity, a major and decisive event in the history of Italian literature.

The Comic Poets

Alongside, and in contrast to, the poetry of the *dolce stil nuovo*, numerous poets in the late thirteenth century and the early fourteenth composed a large body of burlesque or realistic lyrics. Indeed, even some of the *dolce stilnovisti* wrote poetry in this vein: Guinizzelli (*Volvol te levi, vecchia rabbiosa*, "May a whirlwind lift you up, you furious old hag"), Cavalcanti (the *pastourelle* *In un boschetto*, "In a little wood"; and the sonnet *Guata, Manetto, quella scrignutuzza*, "Manetto, look at that little hunchback woman"), and Dante (his exchange of sonnets with Forese Donati). Among the so-called comic poets, Folgore da San Gimignano composed several sonnet sequences, one of which catalogs the activities, delights, and festivities of the months of the year, all of which are viewed nostalgically from the perspective of the old nobility in the bourgeois Italian communes. Folgore's idealistic view was satirized by Cenne (or Bencivenne) da la Chitarra, who wrote his own sonnet cycle systematically undercutting each of Folgore's visions.

The foundation of the Italian burlesque tradition consists of motifs common to comic poetry throughout Europe during the Middle Ages. In large part these derived from the Latin Goliardic lyrics: daily events, misogyny, the vicissitudes of fortune, poverty, and virulent or satiric attacks on individuals (based on sexual abnormalities, physical weaknesses and defects, petty jealousies, and the like).

The Florentine Rustico Filippi (died c. 1300) composed fifty-eight sonnets that are evenly divided between traditional courtly themes and the presentation of people, events, and sentiments of a decidedly more common, vulgar, and even perverse nature. Rustico uses typical rhetorical devices, such as exaggeration, parody, and irony, to underline the unsavory physical characteristics of certain individuals, as we can see in the following verses (the first six verses of a sonnet):

Ne la stia mi par esser col leone

*quando a Lutier son presso ad un migliaio,
ch'e'pute più che 'nfermo uom dipregione
o che nessun carname o che carnaio.
Li suo' cavegli farian fin buglione
e la cuffia faria ricco un oliaio.*

("It seems as though I'm in the cage with a lion when I'm a mile away from Luther, for he stinks more than a sick man in prison or more than any hunk of rotting meat or any pile of bodies. His hair would make a great broth and his cap would make an oil merchant rich.")

In another sonnet Rustico uses a mixture of common and courtly language, thinly veiled sexual allusions, and double entendres to describe an attempt by Aldobrandino's wife to exculpate herself from suspicion of adultery with Pilletto:

*Oi dolce mio marito Aldobrandino,
rimanda ormai il farso suo a Pilletto,
ch 'egli è tanto cortese fante e fino
che creder non dei ciò che te n'è detto.
E no star tra la gente a capo chino,
che non se' bozza, e fbtine disdetto;
ma sí come amorevole vicino
co.noí venne a dormir nel nostro letto.
Rimanda il farso ormai, più no il tenere,
ch'e' mai no ci verrà oltre tua voglia,
poi che n'ha conosciuto il tuo volere.
Nel nostro letto già mai non si spoglia.
Tu non dovéi gridare, anzi tacere:
ch 'a me non fece cosa ona'io mi doglia.*

("O my sweet husband Aldobrandino, send the jacket back to Pilletto, for he is such a polite and refined young man that you should not believe what you've been told. And you should not go around with your head bowed down, for you have not been cuckolded, and I swear that to you; rather, he came as a friendly neighbor to sleep in our bed. Send his jacket back to him and do not keep it any longer, for he will never come here against your wishes, since he has understood your will. In our bed he will never again undress. You should not have complained, but remained silent, for he did nothing to me for which I am sorry.")

The Sienese Cecco Angiolieri (c. 1260-c. 1312) was the most prolific poet of comic verse in this period (he wrote 112 sonnets) and is generally considered the master of the comic genre. He satirizes the courtly tradition by incorporating its images, themes, and vocabulary for parodic effects. In one sonnet Cecco describes his personal "trinity"—*la donna, La taverna, e 'l dado* (women, the tavern, and gambling). Several sonnets are in the form of a dialogue between Cecco and his beloved Becchina. In the following example we may note his easy manner, colloquial language, and distinctly "uncourtly" style:

*"Becchina mia!" "Cecco, nol ti confesso."
"Ed i' son tu'." "E cotes to disdico."
"I' sarò altru" "I non vi do un fico."
"Torto mi fai." "E tu mi manda 'l messo. "
"Sì, maccherell'." "Ell'avrà 'l capo fesso."
"Chi gliele fenderàe?" "Ciò ti dico. "
"Se' così niffa?" "Sì, contr'al nimico."
"Non tocc' a me." "Anzi, pur tu se' desso. "
"E tu t'ascondi. " "E tu va col malanno. "
"Tu non vorresti." "Perché non vorria?"
"Ché se' pietosa. " "Non di te, uguanno!"
"Se foss'un altro?" "Cavere'l d'affanno."
"Mai ti conobbi!" "Or non di' tu bugia!"
"Non me ne poss'atar!" "Abbiati 'l danno!"*

(*'Becchina mine!** 'Cecco, I'm not yours.* 'But I am yours.' 'And I deny this.' 'And I will belong to another.' 'I don't give a hoot.' 'You're doing me wrong.' 'So send the messenger to arrest me.' 'Yes, I'll send you the go-between.' 'She'll have a cracked skull.' 'Who will do it?' 'I will.' 'Are you so disagreeable?' Yes, I am, against the enemy.' 'That doesn't mean me.' 'To the contrary, you are the one.' 'You're hiding your true feelings.' 'And you can go to hell.' 'You wouldn't want that.' 'Why wouldn't I?' 'For you are merciful.' 'Not toward you, never.' 'And if I were someone else?' 'I would help that person.' 'I didn't know you well.' 'You aren't lying there!' 'I cannot help myself.' 'Too bad for you!')

Although Cecco was not the first poet to use dialogue in sonnets, he was certainly a master of this technique. Indeed, he exploits to full advantage the restricted space of the fourteen-line form by capturing the excitement and drama of the moment, the spontaneity and

immediacy of the events, and the vigorous and contrasting moods and thoughts of the speakers.

Other comic poets include the Sienese Meo dei Tolomei, the Roman Jew Immanuel, the Florentine Pieraccio Tedaldi, and Pietro dei Faintinelli, whose poems were to a large extent inspired by the political upheavals in his native city of Lucca.

In the mid-fourteenth century Antonio Pucci (d. 1388), the Florentine town crier, composed lyrics (among them no fewer than 141 sonnets) concerned with everyday events and questions of a domestic nature. He was especially interested in the craft of writing poetry (a subject to which he devoted a sonnet sequence) and with the role and position of the poet in society. In one sonnet he focuses on the plight of a rhymer who is called on to compose verses but is not fully appreciated or compensated for his efforts (*Deh, fammi una canzon, fammi un sonetto*). In another he gives advice to a daughter who has just been married; the first two quatrains set the very practical tone that pervades the entire composition:

*Figliuola Mia, po' cbe se' maritata,
convienti far ragion di rinovare
de' modi e de' costumi che suo'fare
con le fanciulle con cui se' usata.
E convienti brigar d'essere ornata
di vita virtuosa e d'onorare
il tuo marito sì che possa andare
ad occhi aperti per ogni contrata.*

("My daughter, now that you are married, you must adopt new habits and act in ways different from those that you and your girlfriends were accustomed to. And you must take pains to lead a virtuous life and to honor your husband so that you can go about in society with no shame.")

Religious Poetry

Much of the religious poetry in this period is narrative, not lyric, in form. However, there emerged in the last quarter of the thirteenth

century a large and impressive body of *laude* (hymns of praise), whose origin may be traced to the liturgical sequences (e.g., Saint Francis's *Laudes creaturarum*). Generally speaking, the *laude* followed a simplified version of the *ballata* and were composed either by individuals or by religious confraternities. The *Laudario cortonese* (so called because the manuscript, number 91, is in the Biblioteca Comunale of Cortona) is the first large collection of these poems with musical accompaniment. The Franciscan friar Jacopone da Todi (c. 1236—1306) was the most prolific writer of *laude* during this period; he composed more than ninety of them. One, *Donna de paradiso*, takes as its subject the crucifixion of Jesus and the lament of Mary. Many scholars consider this *lauda* the first religious drama in Italy. It features four interlocutors: a narrator (perhaps the apostle John), who comments on the action; Jesus; Mary; and the Hebrew people, who observe the events and function much like the chorus in Greek drama. The importance of this poem lies in its vividness; its presentation of the characters and events in a human, natural manner; and its intense depiction of Mary's grief, which is at once personal and universal. The refrain and first three stanzas provide some idea of its dramatic quality:

*"Donna de Paradiso,
lo tuo figliolo è preso
Iesù Crista beato.*

*Accurre, donna, e vide
che la gente l'allide;
credo che lo s'occide,
tanto l'ò flagellato."*

*"Com'essere porria,
che non fece follia,
Cristo, la spene mia,
om l'avesse pigliato?"*

*"Madonna, ell'è traduto:
Iuda sì l'à venduto;
trenta denar n'à avuto,
fatto n'à gran mercato. "*

(Lady of Paradise, your son has been taken, blessed Jesus Christ.

Hasten, lady, and see the people who are striking him; I think they're killing him, so harshly have they beaten him.' 'How could it be that he has been taken? He did nothing wrong, Christ, my dearest hope.' 'My lady, he has been betrayed. Judas sold him; thirty coins he got; he sold him cheaply.')

In other *laude* Jacopone laments the imperfections of this world and inveighs against the corrupt papacy of Boniface VIII (r. 1294-1303).

In addition to a number of *canzoni* on moral topics, Guittone d'Arezzo wrote some very beautiful religiously inspired *ballate*. The following refrain and first stanza of one *ballata* are remarkable for their strong rhythms and fervent, almost ecstatic emotional quality, which is emphasized by the repetition of words and the internal rhymes:

*Vegna,—vegna—chi vole giocundare,
e a la danza se tegna.*

*Vegna, vegna, giocundi e gioia faccia
chi ama Te, da cui sol' onni gioia;
e chi non T'ama, Amor, non aggia faccia
di giocundare in matera de noia.*

*Degrta,—degna;—non pò che reo portare
chi Te, gioioso, disdegna.*

("Come, come, all who wish to experience joy, and join in the dance. Come, come, be joyful and rejoice all who love You, from whom alone all joy comes. And whoever does not love You, Love, may he not dare to rejoice in anything evil. All honor is Yours, all honor is Yours. Whoever scorns You, o joyous one, can only be sinful.")

The Imitators of the Dolce Stil Nuovo

It would be difficult to overestimate the influence of the *dolce stil nuovo* on a wide range of fourteenth-century poets in northern Italy (Veneto and Romagna: Giovanni Quirini, Guido Novello da Polenta, and Niccolò de' Rossi) and northern-central Italy (Tuscany: Fazio degli Uberti, Matteo Frescobaldi, and Sennuccio del Bene).

Without doubt the most important poet of the *Trecento* whom Dante

influenced was Giovanni Boccaccio (1313-1375). We see the extent of this influence in Boccaccio's original works, such as *Amorosa visione* (an allegorical dream vision modeled on the *Divine Comedy*), and in his critical works: his biography of Dante (*Trattatello in laude di Dante*) and his commentary on the *Comedy* (*Esposizioni sopra le Comedia di Dante*, treating the first seventeen cantos of the *Inferno*). Boccaccio's major literary works in narrative poetry (*Filostrato*, *Teseida*, and *Ninfale fiesolano*) and prose fiction (in Italian: *Decameron*, *Filocolo*-, in Latin: *Genealogie deorum gentilium*, *De mulieribus claris*) overshadow his lyric poetry (116 sonnets, two *sirventesi*, two madrigals, and fourteen *ballate*). In the following sonnet, Boccaccio makes classical allusions (the personification of the wind, Zephyr; Ulysses and the sack of winds, from Ovid, *Metamorphoses* 14.233ff) and expresses certain stilnovistic attitudes (e.g., the attempt to move upward in contemplation of the beloved). His setting is a strikingly original topography—the littoral outside Naples, near Baia—that reflects his own experience during his formative years there from 1327 to 1340. The whole is suffused with a vibrant sensuality:

*Toccami 'l visa zefiro tal volta
più che l'usato alquanto impetuoso,
quasi se stesso allora avesse schiuso
dal cuoi' d'Ulisse, e la catena sciolta.
E poi che l'anima tutt'ha in se raccolta,
par ch'e' mi dica: "Leva il volto suso;
mira la gioia ch 'io, da Baia effuso,
ti porto in questa nuvola rinvolta. "
Io lievo gli occhi, e parmi tanto bella
veder madonna entr' a quell'aura starse,
che 'l cor vien men sol nel maravigliarse.
E, com'io veggio lei più presso farse,
lievomi per pigliarla e per tenella:
e 'l vento fugge, ed essa spare in quella.*

("Sometimes zephyr touches my face more forcefully than normal, almost as though it had released itself from the leather sack of Ulysses, and loosed the chain. And then when that breeze has completely gathered in my soul, it seems he says to me: 'Raise your glance; look at this joyful jewel that I, emanating from Baia, bring you enveloped in

this cloud.' I raise my eyes, and it seems so wonderful to see my lady being brought within that gentle breeze that my heart is about to faint from sheer wonder. And, as I see her coming closer, I rise up to take and hold her: but the wind flees, and she disappears with it.")

The Poetry of Petrarch

In his vast literary production Petrarch (Francesco Petrarca, 1304-1374) signals the end of the Middle Ages and inaugurates the Renaissance. While using many of the modes, themes, and images of the earlier lyric tradition, he also succeeded in renovating poetry and in giving it new meaning. In Petrarch's hands, poetry became an end in itself, and he carefully crafted each poem in accordance with his humanistic, classically inspired concept of art and beauty. The principal characteristics of Petrarch's poetry are (1) his fashioning of a relatively limited, often Latinate vocabulary; (2) the balance and proportion he achieves in each verse or each poem; (3) his incorporation of themes and images from classical antiquity, and (4) his intense awareness of self. Indeed, it is in his heightened concern for the individual, in his unprecedented concentration on the inner workings of the human psyche, that his uniqueness, greatness, and "modernity" may be observed. These traits describe all his Latin and Italian poetry (lyric: *Canzoniere*; narrative: *Trionfi*, *Africa*) and prose (*Secretum*, *De vita solitaria*).

The 366 poems (317 sonnets, twenty-nine *canzoni*, seven *ballate*, nine *sestinas*, and four *madrigals*) comprising the *Canzoniere* have as their principal subject the poet's love for Laura and for all that her name—suggestive of the poetic laurel crown—implies. In describing his love, Petrarch not only synthesizes earlier notions of praise, salvation, psychological turmoil, and physiological torment but also focuses on the very human qualities of this passion. The following sonnet is the first in *Canzo niere*, thereby serving as an introduction to the entire collection:

*Voi ch'ascoitate in rime sparse il suono
di quei sospiri ond'io nudriva 'l core*

*in sul mio primo giovenile errore,
quand'era in parte altr'uom da quel ch'i' sono,
del vario stile in ch'io piango e ragiono
fra le vane speranze e 'l van dolore,
ove sia chi per prova intenda amore,
spero trovar pietà, non che perdono.
Ma ben veggio or sì come al popol tutto
favola fui gran tempo, onde sovente
di me medesimo meco mi vergogno;
e del mio vaneggiar vergogna è 'l frutto,
e 'l pentersi, e 'l conoscer chiaramente
che quanto piace al mondo è breve sogno.*

("You who hear in scattered rhymes the sound of those sighs with which I nourished my heart during my first youthful error, when I was in part another man from what I am now: for the varied style in which I weep and speak between vain hopes and vain sorrow, where there is anyone who understands love through experience, I hope to find pity, not only pardon. But now I see well how for a long time I was the talk of the crowd, for which often I am ashamed of myself within; and of my raving, shame is the fruit, and repentance, and the clear knowledge that whatever pleases in the world is a brief dream"—trans. Robert M. Durling.)

The sonnet is addressed to past, present, and future readers: to all of us who read, are affected by, and can identify with the many and varied sounds of Petrarch's sighs, the various ways in which he weeps and speaks of his love for ephemeral things. The sonnet is confessional in tone, and through its elegant phrasing we can see into the psyche of the poet, observe his high degree of introspection and self-knowledge, and appreciate his masterly poetic art.

In their presentation of the amorous experience, many of Petrarch's lyrics describe the paradoxical state of the lover who complains of this "bittersweet" sentiment. These oxymoronic expressions, which are symptomatic of Petrarchan passion, reach a culmination in sonnet 134 of the collection, as the first quatrain and the last tercet demonstrate:

*Pace non trovo et non ho da far guerra,
e temo et spero, et ardo et son un ghiaccio,*

*et volo sopra 'l cielo et giaccio in terra,
et nulla stringo et tutto 'l mondo abbraccio.*

...

*Pascomi di dolor, piangendo rido,
egualmente mi spiace morte et vita.
In questo stato son, Donna, per vui.*

("Peace I do not find, and I have no wish to make war; and I fear and hope, and burn and am of ice; and I fly above the heavens and lie on the ground; and I grasp nothing and embrace all the world. ... I feed on pain, weeping I laugh; equally displeasing to me are death and life. In this state am I, Lady, on account of you"—trans. Robert M. Durling.)

Petrarch worked on *Canzoniere* for more than thirty years, composing, meditating, correcting, and elaborating; and in this remarkable poetic legacy he captured the lyrical quality of his desires and aspirations, expressed his internal conflict between love and reason and his simultaneous quest for earthly glory and spiritual salvation, and demonstrated his rhetorical skill in moral and political invective. Most critics agree that his most important contribution to the lyric tradition lies in his great success with the sonnet form, which today is generally—though incorrectly—known as the Petrarchan sonnet. His sonnets have been praised for their precision, compactness, graceful symmetry, vibrant musicality, noble sentiments, and intimate tone. Indeed, in the crystallization of the sonnet form and the concomitant thematic elevation and stylistic refinement in the lyrics of Petrarch we may note the origin of and motive force behind the literary current known as Petrarchism, which spread throughout Europe in the Renaissance.

Followers of Petrarch

Petrarch's contemporaries show his influence in their use of classical allusions, themes, and refined poetic diction. One of these contemporaries, Antonio Beccari da Ferrara (1315—c. 1374), wrote some eighty-five lyrics on autobiographical, political, amorous, and religious subjects. He also appears to have been the inventor of the *disperata*, a genre in which the poet laments his star-crossed condition and inveighs

against the powers that be.

The Florentine Cino Rinuccini (d. 1417) was influenced by the *dolce stil nuovo* but also modeled his small collection of twenty-five poems on Petrarch's *Canzoniere*. Simone Serdini (Siena, c. 1360-1420) also wrote under this dual influence; in addition, following the lead of Antonio Beccari, Simone composed two *disperate*—*Le 'nfastidite labbra in ch'io già pose* ("My tired lips in which I once put") and *Corpi celesti e tutte l'altre stelle* ("Celestial bodies and all the other stars")—which are among his best lyrics. Other poets worthy of mention are the Paduan Francesco di Vannozzo and the Florentines Ricciardo da Battifolle and Lorenzo Moschi.

Musical Forms: The Caccia and the Madrigal

As a result of the musical innovations introduced by the *ars nova* in France and Italy, two metrical forms emerged during the *Trecento*: the *caccia* and the madrigal. The *caccia* is characterized by its attempt to represent—through its irregular meter and its use of short, staccato dialogue and onomatopoeic phrases—the dynamic activity and lively movement of the hunt (as its name implies) and, by extension, any outdoor activity associated with "hunting" (such as seeking flowers, herbs, mushrooms, and loved ones).

In one *caccia*, which may be considered typical, Niccolò Soldanieri (Florentine, d. 1385) presents the frenetic activity of a group of fox hunters who urge on their dogs in pursuit of the prey. Through its irregular meters and short monosyllabic verbal utterances this *caccia* presents a realistic scene full of movement:

*Per un boschetto fra pungenti spine,
con cani a mano e bracchi, in qua e 'n la
gimo aizzando:—Té, tetté, tetté,
—Ulivo, torna qua.
— Va su, va su, Donnà.—*

*E'n questo:—A te, a te,—gridare—a te—,
udimo—o del can nero, guarda guarda:
la fuia, ell'è la fuia! A te, ve' là.*

—*In te, in te, in te, o tu sta' in te!*

("In a wood among prickly thorns, with dogs and hounds on a leash, here and there, we egged them on: 'Over here, over here.' 'Ulivo, come back.' 'Donnà, go up, go up.' And then we heard shouts from this side: 'It's coming your way, toward you, toward you!' 'Watch out, watch out for the black dog: the fox, it's the fox! It's coming toward you, look over there.' 'It's yours, it's yours, get 'im!' ")

The madrigal is a short poem with a reasonably standard metrical form, usually two groupings of three lines each, followed by a rhyming couplet. The subject matter is generally amorous; the setting is often an idyllic scene depicted in an indistinct, hazy atmosphere; and the characters are, for the most part, peasants. In the following anonymous example, which was set to music by the renowned Giovanni da Cascia, the narrator celebrates the exceptional beauty of his lady—whose name would appear to be Anna, as the play on *Annamorarmi* suggests—as seen within the natural setting:

*Appress' un fiume chiaro
donn' e donzelle ballavan d'intorno
ad un perlato di be' fiori adorno.*

*Tra queste una ne vidi
bella leggiadra e amoroso, tanto
che 'l cor mi tolse col suo dolce canto.*

*Annamorarmi fa 'l suo viso umano,
el dolce sguardo e la pulita mano.*

("Next to a clear stream ladies and maidens were dancing around a chinaberry tree adorned with lovely flowers. Amid these I saw one who was beautiful, gracious, and so lovely that she seized my heart with her sweet song. Her lovely face, sweet glance, and graceful hand made me fall in love [with Anna].")

Other madrigals are humorous or risqué, presenting in a rustic or an urban setting scenes populated with stereotypical characters, such as the overeager young lovers and the watchful old woman (here the mother) in this poem by the Florentine Alesso di Guido Donati:

In pena vivo qui sola soletta,

*giovin richiusa dalla madre mia,
la qual mi guarda con gran gelosia.*

*Ma io le giuro alia croce di Dio
che, s'ella mi terrà qui più serrata,
ch'i' dirò:—Fa con Dio, vecchia arrabbiata—,*

*e gitterò la rocca, il fiiso e l'ago,
amor, fuggendo a te di cui m'appago.*

("In pain I live here very lonely, a young woman shut in by my mother, who guards me most jealously. But I swear to her on the cross of God that, if she keeps me locked up here any more, I will say: 'Go to hell, you irate old woman'; and I will throw away distaff, spindle, and needie; and run to you, my iove, with whom I satisfy all my desires.")

From its auspicious beginnings at the court of Frederick II through several poetic schools in the thirteenth century to its flowering in the fourteenth century, Italian lyric poetry provided a firm and rich literary foundation on which subsequent generations of poets—in Italy and throughout Europe—would build.

Italian Poetry: Popular

The oldest form of Italian popular poetry was probably the epic poems of the *giullari*, or troubadours. Few verifiable traces of their oral performances remain, but we may surmise that they sang the adventures of legendary heroes, celebrated the deeds of local aristocrats and the beauty of their ladies, and extolled love in the abstract. Exordiums calling on God to help the minstrel in his task were a likely feature of troubadour poetry. Other popular poems are the anonymous *serventese romagnolo* and the *canzoni* of Castra and Zerbitana, as well as among the thirteenth-century *Memoriali bolognesi*.

"Popular poetry" is difficult to categorize. In the broadest sense, any verse in the vernacular, as distinct from Latin, was "popular"—i.e., of the people. In proposing a definition, one must also take into account wide circulation or readership; Dante's *Comedy* was very "popular" in this sense. Sapegno (1933) associated "popular" with the largely illiterate population of the earliest centuries of the medieval period, and hence with strictly oral forms. As literacy increased, poetry using popular themes and forms was written down; the result is more accurately termed "semipopular." Such poetry both coexisted and contrasted with other, more readily identifiable styles: it was not of the *scuola siciliana*, not of the *dolce stil nuovo*, and not religious or moral-didactic. Popular compositions have subjects that are homely, everyday, even earthy. The register is decidedly not aulic (courtly) but colloquial; the tone may be jocular or biting. The language is normally dialectal. The content, which often parallels that of contemporary *novelle*, can be low, crude, or even scandalous, deliberately shunning the refinements in style and sentiment of the more erudite "schools." Personal or political enemies may be wickedly caricatured. The poets of the emerging bourgeoisie clearly lacked or deliberately suppressed the intellectual background of the academic or ecclesiastical writer; many were, in fact, the sons of merchants or tradesmen.

Popular compositions or elements could also appear, however, in the work of writers known primarily for "art poetry." For example, refined poets of the Sicilian school such as *Giacomo da Lentini* and Giacomino Pugliese sometimes echoed themes from the oral tradition for

humorous purposes. Guido Cavalcanti celebrated both ideal love and real love. In a famous *tenzone* with Forese Donati, Dante himself may have adopted a lower voice simply for amusement or as a poetic exercise. For this reason, it can be difficult to judge whether the sentiments expressed are autobiographical or merely those of a poetic persona.

The majority of extant realistic poetry was produced in Tuscan cities, although examples survive from Perugia, Venice, and Rome. Two sonnet cycles by Folgore da San Gimignano depict realistically, albeit with delicate touches, appropriate activities for each month of the year and for each day of the week. Other minor realistic poets were Ciaccio dell'Anguillaia, Meo dei Tolo-mei (fl. 1279-1291), and Cenne da la Chitarra (fl. 1322-1336).

The humorist par excellence was Cecco Angiolieri of Siena (c. 1260-c. 1313). The grandson of an important banker, Cecco was known for his facetious but biting comments about his cheapskate father, hateful mother, and ugly wife. He also repeatedly describes his delight in beautiful young women, drinking, and gambling.

Less well-known is the Florentine merchant's son Pieraccio Tedaldi (c. 1275-c. 1350), who wrote forty-four sonnets imitative of Cecco that describe daily life faithfully, if not skillfully. Another minor poet, Pietro dei Fattinelli, called Il Mugnone, from Lucca (1290–1349), was born to a noble family but left a short *canzoniere* that uses the realistic style—including an anti-uxorial satire. Such comic vituperation concerning women developed from an old monastic tradition of misogynist writing.

The Florentines Chiaro Davanzati (died c. 1280) and Rustico Filippi (who was born between 1230 and 1240 and died after 1291) wrote many poems in a realistic style. Rustico was the son of a silk merchant. His poems contain satire, caricature, indecent references, nonsense verse, violent personal attacks, and homely images of everyday life, and the best of them are known for their combination of rough realism with humor. Rustico is credited with creating a type of burlesque sonnet that would continue to flourish, reaching its apogee with Francesco Berni in the sixteenth century. Compagnetto da Prato left a composition regarding a *malmaritata*: a young woman laments her husband's unfounded jealousy; finally, tormented, she is driven to taking a lover;

an elderly neighbor woman discovers the affair, but the lover reassures the girl.

Domenico di Giovanni (Florence, c. 1404-1448) was called *Il Burchiello* because he mostly composed *alia burchia*, or "nonsense-like," poetry. Although other authors—such as Franco Sacchetti, a master of prose realism—had produced such poems, Burchiello perfected the style. He was the son of a poor carpenter, was himself a barber by trade, and had a dissolute lifestyle. He wrote sonnets attacking the Medici as well as his own personal enemies. Inevitably, he was imprisoned. Verses that he wrote in his cell describe his woeful condition in a humorous way. Over the centuries, many of his sonnets have lost their immediacy, but his witty word combinations and bizarre images still amuse modern readers, at least on the linguistic level.

Although these poets preferred the sonnet, they also used other popular forms, including the *serventese*, *strambotto*, *madri-gale*, and *canzone a ballo*. These compositions may have been accompanied by music or dancing in performance. For instance, the *caccia*—of which Sacchetti's mock epic *La battaglia delle belle donne* ("The Battle of Beautiful Ladies") is a fine example—stressed rapid movement in its rhythm and content, realistically describing a hunting scene or some other scene of vigorous outdoor activity.

Italian Prose

The remarkable story of how, in a century and a half, a sophisticated and mature literature grew out of virtually nothing, must follow three main paths. One path is the takeover of Latin subject matter by the vernacular. The second is the growth of the literary language and tradition. The third is the creation of new forms of literature, corresponding to new ways of thinking, that resulted in the thirteenth

century from the expansion and ultimate triumph of the middle, or mercantile, class.

The thirteenth century was the era of Saint Thomas, Egidio Romano, and Pope Innocent III (Lothar of Segni, whose *De miseria humanae conditionis* has survived in more than 600 manuscripts). It was an age of university culture, scholastic discipline, a precise technical vocabulary, and a spirit fed by intellectual depth and the habit of thought; it was also a century that produced *summae* of every kind. However, large-scale projects such as Brunetto Latini's encyclopedia were written in French; the early writings in the vernacular were not ambitious, and they were modeled on pious and pedagogic Latin writings. Starting circa mid-century, they were generally anonymous, were based on precedents, and comprised a mixed bag of miracles, thoughts and deeds of historical or fictional figures from the past, Breton-style chivalric adventures, and so on. Early prose fed the public's taste for ethical and religious writings, its curiosity about historical and encyclopedic information, and its fascination with the exotic and the courtly world, which at least in Italy was coming to an end. There is little to distinguish this prose from Latin writings: indeed, many early writings are more or less loose translations from Latin or French.

The typical medieval collection of stories is atemporal. Authority and moral value are made evident by the situation described; the implicit or explicit truth matches what the reader knows about the world; the characters are paradigmatic, with no distinct personality or psychology. The style and vocabulary match the thought: such a collection is short, linear, simple, irregular in syntax and lexicon, and preoccupied very little (if at all) with style. In *Conti morali d'anonimo senese* (*Moral Tales of an Anonymous Sienese Author*), *Conti di anticbi cavalieri* (*Tales of the Ancient Knights*), *Fiori e vita di filosafi e d'altri savi e imper-adori* (*The Deeds and Life of Philosophers and of Other Wise Men and Emperors*), Alexander the Great, Julius Caesar, Cicero, and Socrates live next to Tristan, Aeneas, Frederick I, and Frederick II. In the old myths, new ideals exist to teach lessons of gentility, generosity, and equanimity to the rising middle class. The Latin tradition first handed over to the *volgare* the less cultured writings of myth and adventure, and we then find more ambitious projects such as *Storie de Troia e de Roma* (*History of Troy and Rome*), *Miracole de Roma* (*Wonders of Rome*), and assorted

translations from French, including *Fatti di Cesare* (*Deeds of Caesar*). These works cannot be dated with any accuracy, but none of them appeared earlier than 1240 or later than 1290. The remote and the legendary were chosen as subject matter, so that the eccentric is typical of these tales; and we can discern the pleasurable dimension of early prose by tracing the increasing presence of comic influences. The *Libro de' sette savi di Roma* (*Book of the Seven Sages of Rome*), notwithstanding its title (most of the titles listed here were supplied by editors) and notwithstanding the misogynistic origin of many of the tales, was the first such work to be built around a narrative whole (the *cornice*, or "frame") and the first to successfully integrate elements of the fabliaux—jealousy, lasciviousness, infidelity, and the like. In the recounting of the tale itself, one begins to appreciate the aesthetic value of narrative literature, which in time became more and more self-sufficient.

Commerce and politics, now open to wider sectors of society, created a need for a written language of communication. This language had to be developed from a variety of regional usages, against a background of Latin chancery prose. The written record is rich in attempts to evolve a sense of form, possibly influenced by the spoken word, that would not sacrifice simplicity and clarity. Guido Faba's *Parlamenta ed epistole*, written shortly before the mid-thirteenth century, provides models of vernacular written documents based on the Latin notion of prose rhythm (the *cursus*). Guido was the first to theorize about style in this context; his work is a university experiment, almost a learned game, but it set a precedent as an attempt to give the vernacular the communicative instruments that would make the form "convenient" for a given purpose. In early prose, there is a great interest in rhetoric, speeches, and letters—an interest that must be explained from this perspective. In that regard, perhaps no one was more important than the Florentine notary Brunetto Latini. When Guidotto da Bologna translated *Rhetorica ad Herennium* as *Fiore di rettorica*, he still believed it to have been written by Cicero, whom he calls a "knight." Brunetto's *Rettorica* is Cicero's *De inventione*, although Brunetto modernizes the references (famously, *res publica* becomes *comurte*)-, speech in this work has more than an abstract value: eloquence is a human virtue and aspiration, alongside beauty, grace, and generosity.

The translation of Cicero's orations, done between 1260 and 1270, put into practice the quest for a "new man" appropriate to the new times, and art prose was born. With the pursuit of eloquence, the first centers of vernacular culture arose, in the communes, as did an audience—the first true conquest of literary prose. Admittedly, at times Brunetto's prose is disorganized and his syntax is shaky. Nevertheless, it was from him that other writers learned how to use word placement to bring the expressive value of a sentence into focus; how to balance oppositions; how to achieve symmetry; how to use subordination, series, and combinations of thoughts to give a rounded, rhythmic effect; how to raise their tone in addressing the noblest topics; and how to convey harmonious speech. To repeat, the model was Cicero; and Brunetto initiated a vernacular "age of Cicero," the first timid step toward prehumanism.

Thereafter, the vernacular could no longer be considered inappropriate for any subject matter. From 1260 on, we see a plethora of vernacular documents and experiments of all kinds. Scientific prose is represented by Ristoro d'Arezzo's *Composi-zione del mondo* (*Composition of the World*, 1282), which is intended to entertain almost as much as to enlighten. Bono Giam boni's *Libra de' vizi e delle virtudi* (*Book of Vices and Virtues*) is an ambitious moral work that conceals its medieval Latin sources with a unitary style the author learned by translating late Latin writers. Translations from *Albertano da Brescia's* popular religious works done c. 1300 breathe a different air; under the influence of the Mendicant orders, love of family accompanies love of God, forgiveness is idealized, and there is a new tone that departs from the sublime Christian rhetoric of Innocent III. Guittone d'Arezzo experimented with a sublime vernacular prose, derived from the *trobar clus* (hermetic style) of Provencal poetry, but it had no future in a literature that had become more concerned with finding an audience. Historians and chroniclers, especially in Tuscany, were increasingly laypeople and increasingly committed to local reality; their works are lively and mundane and allow the spoken word to break into a new stylistic register. Works such as the *Cronica di Montaperti* (anonymous, 1260) introduced the eyewitness format of Marco Polo's epic autobiographical fiction and paved the way for Giovanni Villani's great fourteenth-century histories. (Marco Polo's *Il mili-one*, translated

from French c. 1310, was as much an expression of his experience of the orient as an autobiographical recounting of the marvels of the world.)

The thirteenth century produced other book-length prose works, of which *Tristano riccardiano* (possibly c. 1280), imported from France, is the most famous. We can assume that the more cultivated people would have read such a book in the original French; relatively few Italian prose romances have come down to us. *Tristano riccardiano* narrates a series of facts and actions in formulaic prose that evokes rather than represents places, acts, and symbols. The chivalric ideal is considered a paradigm of absolute values, but *Tristano*, like Marco Polo's writing and *Fatti di Cesare*, is entertainment—hedonistic and escapist. About half a century later, another anonymous author took up the Breton literary heritage with the *Tavola ritonda*; this work had, perhaps, less primitive beauty, but its broad construction, which did not conceal the author's intervention, had a very rich future in Italian literature.

The first great monument of Tuscan narrative prose that focused entirely on the pleasure of reading and recounting was *Il Novellino*. It was written between 1280 and 1300, perhaps by more than one author and certainly in more than one redaction. The *belparlare*, or eloquence, of its heroes is the only structural element binding the work together. Thus the work had a remarkably elastic format allowing for simple syntax based on the ideal of *brevitas* and intended to mimic the spoken word. The *Novellino* is neither realistic nor paradigmatic; the justification for its existence is the uniqueness of the experiences recounted. Having left behind the absolute value of the *exemplum*, the author or authors discovered that beauty is itself an intellectual value in which the reader can find a model for intelligence, wit, and courtesy. The *Novellino* combines elements from the Provencal tradition, from medieval Latin collections, and from stories about Frederick II and about legendary figures like Prester John. It seeks to impose only artistic—not moral—unity on this variety of tones. At this point, we can reasonably say that the novella has been born. With Boccaccio, the form would become almost synonymous with Italian prose.

Dante towers over all Italian literature, including prose. Tuscan became "Italian" mainly because of his popularity and influence. Dante's *Vita nuova* is an early fictionalized account of the poet's formation, bound together by the prose. The prose explains the meaning

and reveals the sense of the story. Here Dante develops a new lyrical style based on French melodic prose, on *stilnovo* poetic images and motifs, and on biblical language and effects; the sculpted sentences are filled with tension and drama; personal experience has become a subject of literary enquiry. Memory itself is art, and Dante's ethical-religious questions are given dimension and shape within a literary culture. Dante's *Convivio* can be seen as an attempt to bridge a gap between the university culture of Thomas Aquinas and the lay reader of the vernacular; it is a bold attempt to create a "scientific" or "high" style based on a broad syntactic structure and on technical Latin vocabulary smoothly transposed into Florentine, and appealing to the readers' enthusiasm for knowledge and self-knowledge. In this regard, what is of most interest to us is the quest for a language—neither popular nor sublime—appropriate to the "new" subject matter. Dante's work, in which he applies the eloquent rhetoric of persuasion, demonstrates that there is an appropriate vernacular prose for every field of human knowledge.

Much of the most remarkable prose of the fourteenth century has to do with religion. Domenico Cavaica (fl. 1320-1324) offered a style that was plain, persuasive, and popular, the fruit of much thought on stylistic matters. A few years later, Jacopo Passavanti, who was aware of the need for a popular language, presented human destiny as a dramatic, exemplary struggle against sin and perdition. This was the foundation for the great preachers Giordano da Pisa and, later, Bernardino da Siena. A special place must be reserved for the *Fioretti di San Francesco* (*The Little Flowers of Saint Francis*). This presentation of the idyllic peace of Franciscan spirituality is mannered and subtle and has a fable-like dimension that is actually quite far from the Franciscans' message, but it nevertheless clearly uses the "popular elementary" style to captivate its audience.

Three fourteenth-century historical books are remarkable. Dino Compagni's *Cronica delle cose occorrenti nei tempi suoi*, written between 1310 and 1312, is not an exemplary history; it has no absolute dimension and no mythical origins. Rather, it is based on observation and on the author's unabashedly partisan views and moral suasion. Detailed, personal, dramatic, concretely descriptive, it sets a new tone; the author uses ever more vivid and descriptive language to capture his

passionate experience of the world. With this work, Tuscan historiography moved to the forefront of Italian prose. Compagni's approach seems far from that of Giovanni Villani (1280-1348). Villani, who was a jurist and merchant, offers apparent objectivity and equanimity; and his *Cronica* is written in an easy, plain, popular style that accords with the documentary evidence and the author's observations but can nevertheless rise above the monotony of day-to-day accounts. Offering, famously, the first biographical information on Dante, Villani is a confident "Italian" writer, aware of the place of letters in the world and of a tradition that would not and could not die.

A curious document known as the *Cronica* of the Anonimo Romano, written before 1358 in a difficult Roman dialect, contains an early life of Cola di Rienzo, for which it is famous. The author is impartial and distant from the events he recounts, but he lets the reader participate in the excitement of Cola's rise and ultimate fall. This is a brilliant narrative, replete with gesture, expression, and rapid, plastic description. The terse, dense, cumulative syntax has no equivalent in the fourteenth century and seems to be a product of the author's own personality. The presentation of Cola (ch. 18) is one of the great passages in Italian literature.

The fourteenth century was a time of increasing knowledge and understanding of classical authors. This is perhaps most evident in translations: Bartolomeo da San Concordio's Sallust (before 1313), the anonymous Valerius Maximus, and especially Livy; Petrarch himself corrected the text used, probably by Boccaccio, for the translations of the third and fourth decades. Italian prose was to fulfill its destiny with Boccaccio, who was strongly influenced by classical learning (especially by Ovid) and experimented constantly with literature. Even in his early works—*Filocolo* (1336-1338) and *Elegia di madonna Fiammetta* (1343-c. 1344)—Boccaccio stands apart. He combines sources in new ways and offers adventure, autobiography, naturalism, and wordplay, putting the experience of love at the center of his inquiry into the human heart and mind. His ultimate objective is to have the narration match the infinite and complex variety of reality in a natural way. Our analysis, then, ends with his *Decameron*, in which that objective was reached and a literary tradition was formed. Boccaccio's inheritance, Ciceronian Italian prose, became part of the literary canon as type of formalism

that was increasingly self-referential and detached from a world it no longer needed; meanwhile, the Florentine vernacular had grown into a European tradition.

Italian Prosody

Versification in the Italian vernacular began in the late twelfth century and the early thirteenth, the earliest examples being the *Ritmo laurenziano*, the *Ritmo di Sant'Alessio*, the *Ritmo cassinese*, and the famous canticle of Saint Francis of Assisi (*Cantico delle creature* or *Laud.es creaturarum*). In all these we recognize an attempt to write poetry according to certain metrical principles, but these poems do not, generally speaking, reflect strict adherence to rules of rhyme and rhythm, for their metrical structure lacks uniformity. Not until the lyrics of the Sicilian school do we see the rules of prosody being applied in a regular manner, and in the products of these practitioners of the poetic art we see the beginnings of the Italian literary tradition.

Dante, *De la volgare eloquentia*. Vicenza, T. Ianiculo, 1529. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

The written rules of versification and prosody appear around the turn of the fourteenth century, and the first and most important author to leave us his thoughts on the subject is Dante Alighieri. In his incomplete work *De vulgari eloquentia*, Dante has two major goals: first, he seeks to identify which dialect would best serve as a sort of "national" literary language for Italy; second, once the characteristics of this language are determined, he considers how it should be used in poetry. This language would be, according to Dante, *illustre, cardinale, aulicum, et curiale*—"illustrious, cardinal, courtly, and curial" (*De*

vulgari eloquentia, 1.17.1)—and it would be the proper medium for refined lyric poetry written on the three subjects worthy of treatment in the high or "tragic" style: *salus*, prowess in arms; *venus*, love; and *virtus*, virtue (2.2.7). On the basis of the poets whom Dante cites in his treatise, we may observe the rich variety—in form and content—that characterized the first century of Italian literature. Other early metrical treatises and their authors are Francesco da Barberino (*Documenti d'amore*), Antonio da Tempo (*Summa artis rithimici vulgaris dictaminis*), and Gidino da Sommacampagna (*Trattato de li rithimi volgari*).

Early Italian poetry imitated the themes and forms of the earlier Occitan and Old French traditions, and medieval Latin rhythmical verse exerted a strong formal influence on all the nascent vernacular lyrics, Italian metrics are based both on the number of syllables and on the position of the major accent in the verse; and of these two, the placement of the major stress is the factor defining the various meters. The hendecasyllable (*endecasillabo*) is, by all standards, the most excellent of meters; it is determined not by the number of syllables in the line, which would normally be eleven, but by the occurrence of the major stress (') on the tenth syllable and the secondary stress (') on either the fourth syllable (*endecasillabo a minore*) or the sixth (*endecasillabo a maggiore*). Thus, a "normal" hendecasyllable (*endecasillabo piano*) would follow this model (Dante, *Inferno*, 1.1):

Nel mez-zo del cam-mín di no-stra vi-ta
 1 2 3 4 5 6 7 8 9 10 11

Given that the position of the accent determines the nomenclature, a hendecasyllable could have as few as ten syllables (*ende casillabo tronco*), as in the following example (*Inferno*, 4.60):

E con Ra-ché-le per cui tan-to fè
 1 2 3 4 5 6 7 8 9 10

Or it could have as many as twelve or even (very rarely) thirteen syllables (*endecasillabo sdrucchiolo* or *bisdrucchiolo*), depending on the position of the primary stress in the line (as in *Inferno*, 15.1):

O-ra cen pór-ta l'un de' du-ri màr-gi-ni

1 2 3 4 5 6 7 8 9 10 11 12

Sometimes, for metrical reasons, contiguous vowels must be elided in order to form a single syllable; thus, in order to have the verses scan, poets and readers alike must employ synaloepha if the vowels are elided between words, as in this example (*Inferno*, 5.91):

Se fos-sé a-mí-cô il ré de l'u-ni-vèr-so

1 2 3 4 5 6 7 8 9 10 11

Or they must employ syneresis if the vowels are elided within a single word, as in this example (*nferno*, 7.112):

Que-sti si per-co-teán non pur con mà-no

1 2 3 4 5 6 7 8 9 10 11

In some instances contiguous vowels must be pronounced separately as individual syllables. Thus in order to have the verses scan, poets and readers must employ dialoepha if the vowels occur between words, as in this example (Dante, *Purgatorio*, 8.15):

Che fe-ce mé | a mé | u-scir di mèn-te

1 2 3 4 5 6 7 8 9 10 11

Or they must employ diaeresis if the vowels occur within a single word; such vowels are marked with an umlaut. The following example is from *Inferno* (5.63):

Poi è Cle-o-pa-trás lus-su-ĩ -ò-sa

1 2 3 4 5 6 7 8 9 10 11

Most scholars trace the origin of the hendecasyllable to the Old French and Occitan decasyllable. The *endecasillabo* consists of two hemistichs of uneven length: one part is a septenary (*ettenario*, determined by the major stress on the sixth syllable) and the other is a

quinary (*quinario*, determined by the major stress on the fourth syllable). The manner of division in the verse has also given rise to a distinction between an *endecasillabo a maggiore*, where the septenary precedes; and an *endecasillabo a minore*, when the *quinario* comes first in the line. Here is an example of an *endecasillabo a maggiore* (*Inferno*, 1.17):

Ve-sti-to già dei rág-gi del pia-nè-ta
1 2 3 4 5 6 7 8 9 10 11

And following is an example of an *endecasillabo a minore* (*Inferno*, 1.2)

Mi ri-tro-vái per u-na sel-vá o-scù-ra
1 2 3 4 5 6 7 8 9 10 11

The septenary (*settenario*) is the second most popular meter among thirteenth- and fourteenth-century poets. The first line in Giacomo da Lentini's *canzonetta Meravigliosamente* is in itself a *settenario*:

Me-ra-vi-glio-sa-mèn-te
1 2 3 4 5 6 7

Dante indicates in *De vulgari eloquentia* that early poets preferred verses with an odd number of syllables. Consequently, we find examples of verses with nine syllables (*novenario*, determined by the major stress on the eighth syllable), five syllables (*quinario*), and three syllables (*trisillabo*, accent on the second syllable). The following *novenario* is from the *Frammento Papa-fava* (verse 73):

Que-sta fo bo-na çì-lo-sì-a
1 2 3 4 5 6 7 8 9

The *quinario* below is from Giacomino Pugliese, *Morte perché m'hai fatta s'gran guerra* (7):

E dai cor-dò-glio

1 2 3 4 5

Generally, the *trisillabo* is found only as an internal rhyme— i.e., as a component of a longer verse—as in Guido Cavalcanti's *canzone Donna me prega* (11–12, *l'es-sén-za*):

E qual sia sua ver-tú-dē e sua po-tèn-za

1 2 3 4 5 6 7 8 9 10 11

l'es-sén-za—poi e cia-scún suo mo-vi-mèn-to

1 2 3 4 5 6 7 8 9 10 11

One example of a *trisillabo* used as a separate verse is found in Giacomino Pugliese's *contrasto Donna, di voi mi lamento* (62-63), where it functions as a sort of refrain (*amóre*):

On-d'eo di voi son sal-và-gio

1 2 3 4 5 6 7 8

a-mò-re

1 2 3

Verses with an even number of syllables are less common. Dante notes in *De vulgari eloquentia* (2.5.7), concerning contemporary practice, that "because of their crudity, we have used only rarely lines with an even number of syllables." The most favored parisyllabic verses are the octosyllables (*ottonari*, determined by the major stress on the seventh syllable); and these are the mainstay in more popularly inspired poetry—for example, the following *contrasto* by Giacomino Pugliese:

Don-na di voi mi la-mèn-to

1 2 3 4 5 6 7 8

There are also a few examples of other meters: the *senario* (six-

syllable line, major stress on the fifth) and the *quadrisillabo* (four-syllable line, accent on the third). The following example is from an anonymous poem of the Sicilian school (1-3); verses 1 and 2 are *quadrisillabi*, and verse 3 is a *senario*:

Ro-sa au-lèn-te

1 2 3 4

spren-di-èn-te

1 2 3 4

tu sei la mia vì-ta

1 2 3 4 5 6

In some early narrative poems the basic meters are the alexandrine and the decasyllable. The alexandrine consists of double septenaries (*doppi settenari*), with the two major accents on the sixth and thirteenth syllables, as in this example (Uguccione da Lodi, *Libro*, 132):

ça-mai no fo la çèn-te / sì fal-sa ní sper-çù-ra

1 2 3 4 5 6 7 8 9 10 11 12 13 14

In the decasyllable (*decasillabo*) the major stress is on the ninth syllable, as in this example (Gerardo Pateg, *Enoio*, 1):

No-io-so sun, e can-to di nò-io

1 2 3 4 5 6 7 8 9 10

The earliest examples of poetry in Italian are the *ritmi*, rhymed "rhythmical" compositions that do not have a set metrical or strophic scheme. For example, the *Ritmo laurenziano* is a poem of forty verses arranged in three monorhymed strophes of unequal length (10, 14, and 16 verses each) in a mixture of eight-syllable and nine-syllable lines. The *Ritmo cassinese* has 96 verses, which divide into twelve strophes; each stanza is based on two rhymes: a varying number of shorter

monorhymed verses (usually *ottonari*) and a concluding couplet (sometimes three verses) of longer monorhymed verses (generally *endecasillabi*). Following the same pattern, the *Ritmo di Sant'Alessio* (257 lines) is divided into strophes of unequal length; each stanza has a certain number of shorter monorhymed verses (*settenari*, *novenari*) and generally a concluding rhymed hendecasyllabic couplet.

Although most medieval Italian poetry is rhymed, there are occasional examples of assonance and consonance. For example, Saint Francis's *Cantico delle creature* consists of 33 rhymed or assonanced verses of varying lengths, as these initial lines demonstrate:

Al-tis-si-mu, on-ni-po-ten-te, bon Si-gnò-re
1 2 3 4 5 6 7 8 9 10 11 12 13

tue so' le lau-de, la glo-riâ e l'ho-no-rê et on-ne be-ne-dic-tio-ne
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18

The very long verses are held together by assonance (-òre/òne) and an uncommon case of internal rhyme (-òre/òre), thus achieving a solemnity and an incantatory quality suitable to the subject—praise of the creator by, through, and for his creatures.

In the Italian language, rhymes are exact; and in order to rhyme, words must be identical from the major stress to the end of the word. Designations of rhymes and their meters follow the terminology given to individual words depending on whether the stress is on the penultimate syllable (a *parola plana*-, *amòre/dolòre*), on the antepenultimate (a *parola sdruc-ciola*-, *càn-tano/piàntano*), or on the final syllable (a *parola tronca*: *complì/ sentì*). Thus, an *endecasillabo piano* would conclude with a *parola plana*, an *endecasillabo sdruc-ciolo* with a *parola sdruc-ciola*, and an *endecasillabo tronco* with a *parola tronca*; and these verses would have, respectively, eleven, twelve, and ten syllables.

Sometimes "eye rhymes" (*rime all'occhio*) are used: words that are apparently identical but are actually not, because of a difference in accent: e.g., *palmilalmilsalmi* (*Inferno*, 31.65, 67, 69). Composite rhymes (*rime composte*) are occasionally found in early lyrics: e.g., *oncia! sconcia! non ci ha* (*Inferno*, 30.83, 85, 87). Numerous examples may be

found in the poetry of Guittone d'Arezzo: *forzolfor zo* and *magnolmagn'ho* (in *Tuttur, s'eo veglio o dormo*, 21-22, 33–34).

Other sorts of rhymes and rhyming techniques are present in early Italian poetry. In equivocal rhyme (*traductio*) the word is the same, while the meaning changes: e.g., *passo* ("step") / *passo* ("I pass"). In derivative rhyme (*replicatio*) the words have the same etymon: e.g., *partel diparte* and *facel sface*. In rich rhyme (*rima ricca, cara*) unusual word forms are used instead of their more common ones: e.g., *abbo* (i.e., *ho*)/*gabbo*.

An orthographical phenomenon known as *rima siciliana* ("Sicilian rhyme") has been identified in a number of early Italian lyrics. This designation refers to words such as *dire* and *tacere* and *tutto* and *motto* that, because of the identity of the vowels *e* and *i* and *o* and *u* (except for open *e* and *o* in a tonic syllable), are true rhymes in Sicilian dialect—*diri/taciri* and *tuttulmuttu*—but not in the Tuscan dialect. In the late thirteenth century and the early fourteenth, Tuscan scribes who were copying the lyrics of the Sicilian poets into codices followed their own orthographical conventions and "tuscanized" the texts, thus giving rise to "Sicilian" rhymes such as *ride* ("laughs" or "smiles")/*vede* ("sees"), Sicilian *ridil vidi*;, and *ascoso* ("hidden")/ *incluso* ("included"), Sicilian *ascusulinclusu*.

Lyric and narrative poetry integrate all the disparate elements noted above into a poetic whole, a unified metrical structure with particular verse forms and rules. Dante considered the *canzone* (ode) the most elegant, most artistically perfect, and most suitable poetic form for the three noble subjects—prowess in arms, love, and virtue. The *canzone* developed in Italy under the direct influence of the Occitan *canso*, the Old French *chanson*, and the German minnesong. The following stanza from Cino da Pistoia's /' *no spero che mai per mia salute* will serve as the basis for discussing the strophic structure of the *canzone*. The *fronte* consists of the first and second *piedi* ("feet"); the *sirma* consists of the first and second *volte* ("turns").

Fronte

First *pie*de:

I' *no spero che mai per mia salute*

*si faccia, per vertute—di sofferenza
o d'altra cosa,
questa sdegnosa—di Pietate arnica;*

Second *piede*:

*pot non s'è mossa da ch'ell'ha vedute
le lagrime venute—per potenza
de la gravosa
pena che posa—nel cor che fatica.*

Sirma

First *volta*:

*Però trovando pianger la mia mente,
i' vo dolente—cosituttavia,
com 'uomo che non sente
né sa dove si sia
da compare altro che in parte ria.*

Second *volta*:

*Non so chi ai ciò faccia canoscente
più l'altra gente—che la vista mia,
che mostra apertamente
come l'alma desia,
per non vedere il cor, partirsi via.*

The rhyme scheme of the eighteen-verse strophe is:

A(a)Bc₅(c₅)D/A(a)Bc₅(c₅)D//E (e₅)FefF/E(e₅)FefF

In indicating rhyme scheme, capital letters are used for hendecasyllables and lowercase letters for septenaries; all other meters are identified with lowercase letters plus a subscript number (e.g., in this poem C₅ indicates a *quinario*). Thus, this strophe consists of hendecasyllables, septenaries, and *quinari*, with both *settenari* and *quinari* as internal rhymes (designated by parentheses). The basic division of virtually all *canzone* strophes is bipartite, into *fronte* and *sirma*. In this example the *fronte* divides into two identical *pedi* (feet) of four verses each—A(a)Bc₅(c₅)D—and the *sirma* into two identical

volte (turns) of five verses each— E(e₅)FeflF, although more often than not the *sirma* is undivided. The passage from *fronte* to *sirma* also marks the change from one musical pattern to another, and this moment of transition is called the *diesis*, a term which refers both to the changeover and, often, to the first verse in the *sirma* that introduces this new harmony.

A *canzone* usually has between five and seven strophes, all following the same rhyme scheme. Not uncommon, however, is the *cobbola* (from *cobla*, Occitan "stanza"), an isolated stanza of a *canzone*, which stands thematically and metrically on its own, following the Occitanic tradition of *coblas esparsas* ("scattered strophes").

Sometimes, also following the Occitanic models, a *canzone* will conclude with an envoi (*congedo*, *commiato*, *tornado*), which is metrically identical to the *sirma* (or a part of it). Here the poet addresses the poetic composition and gives it specific advice or instructions (where it should go, with whom it should speak, what it should say, etc.). For example, Guido Cavalcanti's *canzone Donna me prega* has this envoi, which follows the rhyme scheme of the last five verses of the *sirma* including the internal rhymes:

*Tu puoi sicuramente gir, canzone,
la 've ti piace, ch'io t'ho sì adornata
ch'assai laudata—sarà tua ragione
da le persone—c'hanno intendimento:
di star con l'altre tu non hai talento.*

In imitation of the troubadour Arnaut Daniel, Dante introduced into Italian literature a particular type of *canzone*, the *sestina*. The *sestina* is also known by the descriptive phrase *retro-gradatio cruciata*, which refers to how the rhymes "cross over" first from the end and then from the beginning of the stanza. A *sestina* has six stanzas of six verses each plus a three-line *congedo*. It is a technical tour de force: the same six rhyme words are used throughout the poem, and the rhyme scheme follows a rigid permutation whereby at the end of the six stanzas, the pattern is ready to repeat itself. Unlike a "normal" *canzone*, the *sestina* has no division within the stanza between *fronte* and *sirma*. Dante's *sestina*, *Al poco giorno e al gran cerchio d'ombra* will serve to demonstrate the intricate set of changes the rhymes follow over the

course of the composition. The six rhymes—A = ombra; B = colli; C = erba; D = verde; E = petra; F = donna—are ordered according to the pattern shown in the table. The *congedo* of the *sestina* uses all six rhymes, two per verse, but not necessarily according to any strict pattern. Petrarch invented the "double" *sestina* (e.g., *Mia benigna fortuna e 7 viver lieto*, *Canzoniere* 332), in which the permutations run through twelve six-line stanzas, instead of six, plus a three-verse *congedo*. *Al poco giorno e al gran cerchio d'ombra* (Dante)

Stanza 1	Stanza 2	Stanza 3	Stanza 4	Stanza 5	Stanza 6
1 A	6 F	3 C	5 E	4 D	2 B
2 B	1 A	6 F	3 C	5 E	4 D
3 C	5 E	4 D	2 B	1 A	6 F
4 D	2 B	1 A	6 F	3 C	5 E
5 E	4 D	2 B	1 A	6 F	3 C
6 F	3 C	5 E	4 D	2 B	1 A

The distinctly Italian *ballata* (also called *canzone a ballo*) originated in the mid-thirteenth century. As its name suggests, it was intended as a song to accompany a dance. Because of this poetic "impurity," Dante classified it below the *canzone* in the hierarchy of poetic forms, but above the sonnet, which he apparently considered too brief to be a serious form. The metrical form of the *ballata* follows that of the *canzone* with two important exceptions: (1) every *ballata* begins with a refrain (*ripresa*, *ritornello*), which in actual performance would be repeated after each stanza; and (2) a link through rhyme always exists between the refrain and each stanza, by virtue of the repetition of one or more rhymes of the *ripresa* at the end of each stanza. The following *ballata* by Lapo Gianni will serve as an example of the form.

Refrain:

*Net. vostro viso angelico amoroso
 vidi i belli occhi e la luce brunetta,
 che 'nvece di saetta
 mise pe' miei lo spirito vezzoso.*

Stanza

First *piede*:

*Tanto venne in su' abito gentile
quel novo spiritel ne la mia mente,
che 'l cor s'allegra de la sua veduta;*

Second *piede*:

*dispuose giù l'aspetto signorile,
parlando a'sensi tanto umilmente,
ch'ogni mio spirit' allora 'l saluta.*

Sirma (undivided):

*Or hanno le mie membra canosciuta
di quel signor la sua grande dolcezza,
e 'l cor con allegrezza
l'abbraccia, poi che 'l fece virtuoso.*

The rhyme scheme of this refrain is XYyX, and that of the stanza is ABC/ABC//CDdX. In this case rhyme X (-oso) is the link between refrain and strophe and provides the metrical and musical transition to the refrain that would then be repeated. *Ballate* are of several kinds, and their names are determined by the number of verses in the *ripresa*: a four-verse refrain indicates a *ballata grande* (the example given above); a three-verse refrain is a *ballata mezzana*-, a two-verse refrain is a *ballata minore*; a one-verse refrain is a *ballata piccola* (a one-verse refrain with a meter shorter than an *endecasillabo* is called a *ballata minima*); a refrain with more than four verses makes the poem a *ballata stravagante*.

The *lauda* (hymn) follows the basic metrical structure of the *ballata*, as this example from Jacopone da Todi demonstrates

Refrain:

*"Donna de Paradiso,
lo tuo figliolo è preso
lesù Cristo beato.*

First stanza:

*Accurre, donna e vide
che la gente l'allide;
credo che lo s'occide,
tanto l'd flagellato."*

Second stanza;

*"Como essere porria,
che non fece follia,
Cristo, la spene mia,
om l'avesse pigliato?"*

As is dear, the refrain has the metrical structure yyx (note the Sicilian rhyme *Paradisolpreso*) and each four-line stanza has three monorhymed verses aaa plus the repetition of the x rhyme, thus giving aaax bbbx, etc. The refrain would, of course, be repeated after each stanza.

The sonnet was probably invented by Giacomo da Lentini, a notary attached to the imperial court of Frederick II Hohenstaufen in Sicily. Various attempts have been made to trace the origin of this fourteen-line composition: it may have resulted from a fusion of two *strambotti* (eight-line popular poems in *endecasillabi* in alternating rhyme), with the second *strambotto* shortened to six verses); it may represent an attempt to achieve mathematical perfection in terms of Pythagorean harmonies; it may have resulted from imitation of the *canzone* strophe; or it may simply have been a felicitous thought of Giacomo s. However it originated, its basic fourteen-line form was fixed from the beginning as a bipartite composition consisting of an octave in alternating rhyme ABABABAB and a sestet in a variety of schemes (CDCDCD and CDECDE are the most common), all *endecasillabi*. Later in the thirteenth century a new form was invented for the octave—ABBAABBA—and this became the preferred pattern. Numerous rhyme schemes were devised for the sestet: CDEEDC, CDCCDC, CDEDCE, and so on. What emerges is a sense of versatility and flexibility within the artificial restrictions of a fourteen-line composition. Indeed, this short metrical form provided a sort of proving ground for poets, who were eager to test their poetic abilities within its limits.

Early on, the sonnet became the vehicle for poetic correspondence in

tenzoni, in which one poet would write a sonnet on a particular topic (generally on love, but sometimes on moral issues) and send it to another, requesting the addressee's views on the subject. The addressee would then respond, generally *per le rime*, i.e., using the same rhymes and rhyme scheme as those in the original sonnet. In addition to this epistolary use, the sonnet also became the basic strophic unit in sonnet cycles (known as *corone di sonetti*), which were composed on such subjects as the days of the week and the months of the year (e.g., cycles by Folgòre da San Gimignano) and in longer narratives (e.g., *Il Fiore*, attributed to Dante, presents a greatly abbreviated version of the Old French *Roman de la Rose* in 232 sonnets).

In the hundred years or so of its existence the sonnet underwent a number of formal transformations in the hands of adventurous poets who expanded the seemingly rigid fourteen-line structure in various ways. For example, *sonetti caudati* ("tailed" sonnets) have additional verses (one, two, or three) tacked on at the end: e.g., ABBA ABBA CDC DCD D or ABBA ABBA CDC DCD EE. The *sonetto doppio* ("double sonnet"), invented by Puccianzone Martelli (*Signorsensapietansa, udit'ho dire*), consists of twenty verses with *settanari* added after verses 1, 3, 5, and 7 of the octave and after verses 10 and 12 of the sestet: e.g., AaBAaB AaBAaB CDdE CdDE. The *sonetto doppio caudato* ("double tailed" sonnet) follows the form of the *sonetto doppio* with the addition of extra verses forming the "tail": e.g., AaBBbA AaBBbA CdDD DdDC EE. Guittone d'Arezzo invented the *sonetto rinterzato* (e.g., *O benigna, o do Ice, o graziosa*), which is very similar to the *sonetto doppio*, except that its twenty-two verses have an additional two *settanari* in the sestet: e.g., AaBAaB AaBAaB CcDdC DdCcD (thus giving greater emphasis to a rhyme by repeating it in the *terzine*, the sestet). Finally, the *sonetto raddoppiato* ("redoubled" sonnet), true to its name, has twenty-eight verses, twice the number of the "normal" sonnet: e.g., ABAB ABAB ABAB ABAB CDE CDE FGH FGH (or CDCDCD EFEFEF). Another variation on the basic sonnet form—invented by Guittone d'Arezzo but brought to perfection by the Florentine rhymer Monte Andrea—is the sixteen-verse sonnet, with a ten-line first part: e.g., ABABABABAB CDCDCD.

The origin of the *strambotto* was probably popular. Two varieties are most common: the *strambotto siciliano* (ABABABAB) and the

strambotto toscano (ABABABCC), all hendecasyllables (the latter is virtually identical to the *ottavd*). A related form, the *rispetto*, generally has six verses in the pattern ABABCC or ABABAB, but there are also eight-verse examples: ABABCCDD.

The *discordo* came into existence early in the thirteenth century (no later examples survive), perhaps in imitation of the Occitan *descort*. As its name suggests, this metrical form attempts to convey the "discordant" or "discombobulated" state of the poet because of love through a series of radically different strophes of varying lengths and diverse meters and rhymes. For example, four strophes in the *discordo Donna, per vostro amore* by Giacomino Pugliese read as follows:

*Rosa fresca,—già non ti 'ncresca
s'io canto ed ispello;
a tutt'ore—per vostro amore
eo sono novello;
mentre vivo—a voi cattivo
non sono rubello.*

*La feruta non muta de' sguardi;
ancora gli mi mandate tardi,
passano balestri turchi e sardi;
sim'anno feruto i vostri sguardi.*

*Tutto 'ncendo—pur vegendo;
fina donna, a voi m 'arendo.*

*Rendomi in vostra balia,
voi siete la donna mia,
fontana di cortesia,
per cui tutta gioi si 'nvia.*

The unusual meters {*quadrisillabi, senari, novenari, aecasillabi, ottonari*) and rhyme schemes—(a₄)a₉b₆(c₄)c₉ b₆(d₄)d₉b₆// e₁₀e₁₀e₁₀e₁₀// (f₄)f₈f₈//g₈g₈g₈g₈—of these stanzas, together with the internal rhymes, all contribute to the unevenness, conflict, and disharmony of both form and content. This dynamic union indicates the virtuosity attained by the Sicilian poets in the first half of the thirteenth century.

The fourteenth century witnessed the birth and development of other lyrical forms, including the madrigal, *caccia*, and *frottola*. The madrigal,

modeled on the strophe of the *ballata*, usually consists of two three-line *piedi* based on three or four rhymes and a final rhymed couplet (or two), all in hendecasyllabic meter. The first madrigal in Petrarch's *Canzoniere* (52) will provide an example of the form:

*Non al suo amante più Dīana piacque,
quando per tal ventura tutta ignuda
la vide in mezzo de le gelide acque,*

*ch'a me la pastorella alpestra et cruda
posta a bagnar un leggiadretto velo,
ch'a l'aura il vago e biondo capel chiuda,*

*tal che mi fece, or quand'egli arde 'l cielo,
tutto tremar d'un amoroso gielo.*

The rhyme scheme begins as *terza rima* and concludes with a rhymed couplet: ABA BCB CC. Other possible rhyme schemes include the following: ABC ABC DD; ABA BCB DD; ABB ACC DD; ABB CDD EE; ABB ACC CDD; ABA CBC DE DE; ABB CDD EE FF; ABB CDD EFF GG.

The *caccia*, which has no regular rhythmic or strophic structure, attempts to depict through the sounds of words and the irregular meter a frenetic, dynamic scene, such as a hunt (as the name *caccia* implies). In the following *caccia* we may observe how the poet, Franco Sacchetti, is able to capture the movement and excited quality that accompanies a trip to the woods to gather flowers:

*Passando con pensier per un boschetto,
donne per quello givan, fior cogliendo,
"To' quel, to' quel" dicendo,
"Eccolo, eccolo!"
"Che è? Che è?"
"È fior alliso."
"Va' la per le viole. "
"Omè, che 'l prun mi punge!"
"Quell'altra me' v'aggiunge."
"Uh, uh! O che è quel che salta?"
"È un grillo."
"Venite qua, correte:*

Raperonzol' cogliete."

"E' non son essi"

"Sì, sono."

The uneven rhyme scheme, consisting of *endecasillabi*, *settenari*, *quinari*, and *trisillabi* (ABbc₅d₅e₅fgghi₃jjk₅l₃), is accentuated by the rapid bits of conversation.

The *frottola*, as its name suggests, is a sort of grouping together of various ideas and motives (often strange) expressed in verses of varying length that are linked in groups of threes by end rhyme and internal rhyme. The initial verses of the *frottola giullaresca* by Antonio da Ferrara are as follows:

*Già fo chi disse,
per queilo ch'io sentisse,
e anche scrisse—de quelb cb 'io diro,
e sì no me vergognarò,
ché 'l no è pur mò—de prima,
cb'el se diga per rima
de chi sta in cima—e de che trabucca,
ben che l'un sepelucca
e mettelise in zucca—el calavrone,
l'altro è Salamone,
Ettor e Sansone....*

The rhyme scheme is a₅a(a₅)Bb₉(b₅)cc(c₅)Dd(d)Eee₆, and the poem thus continues for 176 verses. Another variety is the *frot-tola letteraria*, which has regular four-line stanzas with short verses (*quinari*, *senari*, and *settenari*) in which the first three are monorhymed and the fourth is constant throughout the poem: aaax bbbx cccx. In *Del mondo ho cercato*, Manoello Romano applies this rhyme scheme using *senari*:

*Del mondo ho cercato
per lungo e per lato
un caro mercato
per terra e per mare.*

*Vedut'ho Sorìa
infin Erminia
e di Romania*

gran parte, mi pare.

The *serventese* (*sirventese*) derives in part from the troubadour *sirventes*, whose subject matter was primarily political, religious, or moral. In the Italian tradition it is generally a narrative form devoted to civic, historical, and didactic themes. The stanzas are short, and the last rhyme of each strophe provides the transition to the next, thus "serving" (*servendo*) the next stanza with one of its own rhymes (*servendo is one explanation for the name serventese*). The following example by Antonio Pucci presents a four-line strophe consisting of three *endecasillabi* with a concluding *qmdrisillabo* (AAAb₄ BBBC₄ etc.) for a total of 180 verses:

*At nome di Colui ch'è sommo bene,
lamento pien di tormento e di pene,
piangendo va' di me, due a d'Atene,
sventurato;*

*che 'n giovinetta età fu' addolorato,
quando a mio padre fu 'l capo tagliato
da la compagna, ond'io son sempre stato
con tormento.*

The basic unit of narrative poetry is the *ottava* (*ottava rima*), which consists of eight lines of hendecasyllabic verse, six in alternating rhyme and a rhymed couplet: ABABABCC. This verse form, perhaps the invention of Giovanni Boccaccio, became the standard meter for both the epic (e.g., Boccaccio's *Ninfale fiesco-latino* and *Filostrato*, Boiardo's *Orlando innamorato*, Ariosto's *Orlando Furioso*, and Tasso's *Gerusalemme liberata*) and the more popular *cantari* (e.g., Antonio Pucci's *Madonna Lionessa*, the anonymous *Morte di Tristano* and *La donna del Vergiù*, and many others).

Following the great model of Dante's *Divine Comedy*, poets composed didactic, allegorical poetry—dream visions and the like—in *terza rima*, i.e., hendecasyllabic verses with the interlinking rhyme scheme ABA BCB CDC DED etc., the meter that Dante invented precisely for his poem. Boccaccio used *terza rima* for his *Amorosa visione*, Petrarch for the *Trionfi*, and Fazio degli Uberti for *Il dittamondo*. Shorter poems that used *terza rima* for their meter are

known as *capitoli ternari* or simply *ternari*; their subject matter was primarily moral or political. Some poets used rhyming heptasyllabic couplets for their narrative poems (e.g., Brunetto Latini's *Tesoretto*). The author (sometimes said to have been Dino Compagni) of the allegorical poem *L'intelligenza* invented the strophic structure called *nana rima*, which presents nine *endecasillabi* per strophe arranged ABABABCCB.

During the first two centuries of Italian literature, refined and popular poets alike were conversant with the rules of versification and prosody, and thanks to their diverse and metrically inventive compositions Italy had a firm and fertile foundation for its rich poetic heritage.

Italian Troubadours

[The term "troubadours" must be explored from two angles. Approximately forty troubadours of southern French origin, including Raimbaut de Vaqueiras, Peire Vidal, Elias Cairel, Aimeric de Peguian, Gaucelm Faidit, and Uc de Saint Circ, sought patronage at the wealthy courts of northern Italy. The migration of Occitanic (Provençal) poets began c. 1190 and expanded with the onset of the Albigensian Crusade (1208-1228). These troubadours lived and composed in Italy. There were also northern Italian imitators of the troubadours, including the Bolognese Rambertino Buvaelli (d. 1221); the Mantuan Sordello (c. 1200 – 1269); the Genoese Bonifacio Calvo (fl. 1250-1266); another Genoese, Lanfranco Cigala (died. c. 1257), juriconsult and councillor of the Genoese republic, who is regarded as the most talented of the Italian troubadours; and the Venetian Bartolomeo Zorzi (fl. 1260-1290). Aristocrats such as Thomas II of Savoy and Alberico da Romano engaged in the refined pastime of composing vernacular love lyrics as well. These poets wrote in the language of the troubadours, whereas contemporary French, Spanish, or Sicilian poets translated troubadour poetics into their own languages.

Raimbaut de Vaqueiras, born to an impoverished noble family of the Vaucluse, is the first documented troubadour who left France to seek a living at an Italian court—that of Obizzo II Malaspina, sometime before 1190. Raimbaut later became a dedicated servant at the court of the marquis Boniface di Montferrat. The poet accompanied Boniface I on the Fourth Crusade; was present at the capture of Zara and the conquest of Constantinople; and may have died at Boniface's side, fighting the Bulgars, in 1208. Besides his traditional love songs

composed in Occitan, Raimbaut is known for a lively exchange, *Domna, tant vos ai preiada* ("Lady, so much have I implored you"), in which a Genoese lady insultingly rejects the troubadour's blandishments in favor of her husband's and her own respectability. The stanzas alternate between Occitan and the Genoese dialect; this is the first instance when an Italian dialect is exploited for its expressive potential (in this case, for comic effect) in the context of a mature poetic form. Raimbaut also composed a multilingual *descort*, with stanzas in Provençal, French, Italian, Gascon, and Gallego-Portuguese, conveying his dismay at his lady's rejection. The stanza in Italian, actually a *koiné* of northwestern Italian urban dialects, is an early experiment in the adaptation of the *lingua di sì* to the rules of refined Provençal courtly poetry. Raimbaut also exchanged an abusive *tenso* with Albert of Malaspina (1165-1206). Raimbaut left a varied corpus of twenty-six works including poems composed for dance, *cansos*, an *alba*, a highly regarded epistle, and a *tomeo des dames*—a tournament poem in which the ladies of the Italian courts vie for supremacy, finally settling on Beatrice Margarita, wife of Thomas I of Savoy, as their leader.

The troubadour Uc de Saint Circ played a decisive role in the development of the Italian courtly lyric. He arrived in Italy c. 1219, armed with a collection of verses; remained for almost four decades at the court of Alberico da Romano; and married a woman of Treviso. Although he ceased to write love poetry, Uc, like other troubadours in Italy, composed several political *sirventes* promoting the aspirations of the Guelf Alberico. Scholars believe that Uc was behind a systematic effort to adapt the literature of Occitania to the new Italian public. It is extremely likely that he was responsible for the compilation of the so-called *Liber Alberici*, the oldest extant manuscript of Occitanic verse (it is dated 1254 and is conserved as part of a larger manuscript at the Estense Library in Modena). Between 1220 and 1240, Uc participated in and promoted the writing of *vidas* ("biographies") of the troubadours, as well as *razos*, brief narratives establishing the circumstances that prompted the writing of various poems. These short prose texts were interpolated into the anthologies of Occitanic verse to help the new Italian public understand and value Occitanic literature. Uc was also, in all probability, the Uc Faidit (*faidit* meaning "exiled") who composed a Provençal grammar, *Donat proensal*, the oldest systematic presentation

of a modern literary language.

The first Italian to leave a solid corpus of work in Provençal is the Bolognese Rambertino Buvaelli, who was active in the first quarter of the thirteenth century. His distinguished career of public service included terms as *podestà* in Brescia, Milan, Parma, Mantua, and Verona, and for three years in Genoa, which was a center of Occitanic culture in Italy. He was also an ambassador for and a consul in Bologna, and a legate for Pope Innocent III. Rambertino Buvaelli was educated at the University of Bologna, where, we may assume, he collected troubadour verse. His equilibrated arrangement of the commonplaces of the Occitanic tradition evokes the image of the poet as a dilettante. His poetry is simple and in a plain style and is dedicated entirely to the theme of love. The lady for whom he wrote was Beatrice d'Este, daughter of Azzo VI, lord of Ferrara— an indication that court and chancery together indulged in the refined game of writing Occitanic love lyrics.

Unlike Rambertino Buvaelli, whose personal reputation, legal training, and administrative ability catapulted him to prominence, the most famous Italian troubadour, Sordello (Sor-dello da Goito, died c. 1269), sought promotion through service at the aristocratic courts of Italy and France. He is a character in the *Divine Comedy*, serving as Dante's guide to the Valley of the Princes in Ante-Purgatorio (*Purgatorio*, 6–8). Indeed, Dante may have hoped to profit from the largesse of the Holy Roman emperor Henry VII as much as Sordello had profited from Charles of Anjou, who in 1269 granted castles and territory in the Abruzzi to the troubadour and his heirs. Forty years earlier, Sordello had been involved in a scandalous episode, abducting Cunizza (another soul we encounter in the *Divine Comedy*—*Paradiso*, 9) from the home of her husband at the behest of her brothers, Ezzeiino and Alberico da Romano. According to a widespread rumor, Cunizza and Sordello became lovers. Fleeing Italy, Sordello sought patronage at various courts in southern France, Spain, and Portugal, eventually establishing himself with Raymond Berlingar, count of Provence, and then with Raymond's successor, Charles d'Anjou, whom he accompanied on a military expedition to conquer the kingdom of Sicily in 1265. Sordello left a varied corpus including love songs; political and moral *sirventes*-, and a famous lament (*planh*) for the death of the lord

of Aups, Blacatz, in which the poet urges secular lords to fortify their courage by consuming Blacatz's brave heart. If Sordello's poetry is viewed today as the "dying gasp of a rhetoric that was once vital, witty, and charged with a dialectic of love" (Wilhelm 1987, xxiii), it appears to have left a deep impression on Dante. The lament for Blacatz and a didactic poem about honor, *Ensenhamen d'onor*, were probably the works that inspired Dante to make Sordello the voice of condemnation in *Purgatorio* 6.

Bartolomeo Zorzi, as a merchant, undertook a journey to Constantinople in 1266, was taken captive by the Genoese in one of their frequent wars with Venice, and was a prisoner in Genoa until 1273. During this time he continued to compose. In all, eighteen of his poems are preserved, among them are two poems addressed to the Virgin and a moving *planh* (elegy) for Conradin, the last of the Hohenstaufen dynasty, who was summarily executed in 1268 in Naples. The last noteworthy Italian troubadour is Zorzi's adversary in a *sirventes*, Bonifacio Calvo.

Ivory

Because the idea of medieval Italy is a modern invention, it is not possible to point to a coherent body of ivory carving that might be described as the creation of such a notional entity. Instead, scholars have chosen to hypothesize regional and even local "schools" or "workshops" on the basis of stylistic resemblances to work in other media. The most convincing of these analogies are to works, particularly of architectural sculpture, in monumental settings, even if it is doubtful that ivory carvers also worked in stone. As to questions of localization, comparisons with wood carving, metalwork, and manuscript illumination, while sometimes striking, are subject to the same problems as beset these other equally portable objects. Only recently has adequate attention been paid to the physical evidence for ivory workshops, but such findings, based on archaeology, account for only a tiny minority of the objects said to have emerged from one or another "center" in Italy. It is therefore no wonder that scholarly disagreement hovers over, and sometimes rages around, the locales where even well-known pieces are said to have originated.

Scarcely fewer problems attend the dating of many medieval ivories. Given the value of the material, most objects—Christian or other—were long used in churches or kept in treasuries where their presence may have been recorded in inventories drawn up long after they had entered these institutions; as a result, we can say only that they must antedate a particular document. Often no less frustrating are the legends that have long surrounded particular pieces, fancifully associating them with some great figure of the past or ascribing to them a quite fictitious antiquity.

In light of these difficulties and in the absence of virtually any medieval documentation for the working (as against the use) of ivory

plaques or boxes, any useful report on the body of objects said to have been made in Italy between the beginning of the fifth century and the end of the fourteenth can at best represent such scholarly consensus as exists or make adjudications when radically diverse opinions exist, as they do concerning a sizable number of the objects discussed below. In only one respect can an incontestable proposition be offered about medieval ivory: the prestige of the material derived from its rarity as an exotic import and led to its use in the creation of secular or sacred objects that were probably as highly prized in the Middle Ages as they are today.

Late Antiquity (400-600)

Generalizations about the rarity, and consequently the high cost, of ivory are most open to question with regard to late antiquity. The large number of surviving pieces, their size, and their range of functions—from utilitarian medicine boxes to plaques applied to the covers of sacred books—all argue for the abundant availability of ivory in this period. The largest pieces are diptychs, hinged pairs of ivory plaques issued by consuls and other officials to mark their accession to office, by aristocratic clans to commemorate marriages and other family events, and by highly placed churchmen to articulate points of belief and, implicitly, their own authority. The leaves of consular diptychs—the largest known ivory objects before the statuettes of the Gothic era—could measure up to about 16 by 6 inches (41 by 15 centimeters). However, an example that is more representative in size is a diptych issued c. 400 by Rufius Probianus, who is described in the inscription as "vicar of the city of Rome" and is shown performing his administrative duties as city prefect. Consuls on similar diptychs are shown signaling the start of the public games that they presented when they entered office,

Because of their size, and ultimately their antiquity, diptychs such as the Probianus, which was kept at the abbey of Werden on the Ruhr River, were put to secondary use as tablets inscribed with the names of bishops and those to be remembered in church liturgies. Although very few of the consular series contain explicit Christian iconography, there

is no doubt that ivories demonstrating such beliefs were produced during this era, probably in the same workshops: a plaque (in Castello Sforzesco, Milan) with two scenes alluding to the resurrection is framed with identical ornamentation and displays figures in the same style. Both objects are often said to have been carved in Milan, which—as an imperial residence and ecclesiastic metropolis—does indeed seem a likely source. Other northern Italian centers proposed as the site of workshops include Brescia, where the Museo Civico still preserves a casket well known for its subtle theological interweaving of events from the Old and New Testaments. This casket was a container for relics, perhaps originally and certainly in later use, and is hence called a *lipsanoteca*. On the other hand, pyxides—cylindrical sections of elephant tusks carved on their exterior with a great variety of either pagan or Christian themes—may have been used to hold medications, ointments, incense, and the eucharistic host. Large numbers of these survive, although their places of origin are much disputed. Fragments of a vessel of this sort were found, together with some 1,500 pieces of bone and ivory debris, in an ongoing excavation of a workshop on the east slope of the Palatine hill in Rome. The pins, furniture mounts, and gaming pieces that have turned up at this site indicate not only that bone and ivory were generally worked in the same shop but also that sumptuous objects represent only a small part of a system devoted in the main to the manufacture of utilitarian objects. Given this emphasis, archaeologists are unlikely to determine where unique objects like the Cathedra (throne) of Maximian, archbishop of Ravenna from 546 to 563, were created. Ravenna, where this throne is still kept, has been proposed as its place of origin, although most scholars believe that it was sent to Italy from Constantinople. Whatever its source, the diversity of styles in its (originally) more than forty figurative and decorative plaques suggests the sort of collaboration that characterized workshop production in an age when ivory was in abundant supply.

The Dark Ages and the Carolingian Revival (c. 600-950)

"Barbarian" invasions, political upheavals, the removal of administrative and creative authority from urban to rural centers, and

not least the Muslims' conquest of North Africa are all forces said to have disrupted Mediterranean societies that are recognizably antique. Although the relative weights of these factors cannot be accurately assessed, among their effects were a decline in the amount of ivory reaching northern Italy, a shift in ivory working from cities to monastic ateliers, and a consequent reduction in the range of uses to which the material was put. The distribution of objects in the late medieval and modern eras—they are preserved at Milan, Monza, Trent, Brescia, Cividale, and Ravenna—may reflect the sites of production in the early medieval period. More certain is the appropriation of late antique and early Christian models in the greatly reduced number of pieces that survive from this period, a phenomenon paralleled in other media and, more broadly, in other cultures subjected to social stress.

If a plaque like that depicting Gregory the Great (or an evangelist) in the act of writing on a book cover (now in the Castelfo at Trent) encapsulates a concern with traditional authority, its form no less embodies the impact of late antique diptychs like that of the Poet and Muse preserved in the cathedral treasury at Monza. One of two openwork plaques on a sacramentary presented by Berengar, the first king of Italy (r. 888-924), to the same cathedral has scrolls, inhabited by beasts, derived from classical *rinceaux* (carved, molded, or painted decorations); the other, on the back cover, shows a transformation of these plastic shapes into an interlace based on geometry. The formal aspects of the synthesis of antique and medieval are nowhere better demonstrated, even though the two plaques are presumably contemporaneous. Equally clear is a tendency for laypeople to commission works and donate them to religious institutions. An earlier example is the so-called Pax of Duke Ursus, possibly the Ursus of Ceneda mentioned in 752 by Paul the Deacon. The duke's name is proudly inscribed on the headpiece and wings of the cross in this Crucifixion.

Anonymous, ivory casket known as the *Brescia Lipsanoteca*. Medallion portraits of Christ and Apostles; upper border, scenes from the story of Jonah; *Noli me tangere*, Christ teaching, Christ entering sheepfold. Museo Civico dell'Eta Cristiana, Brescia. Photo: © Scala/Art Resource, N.Y.

The relatively small size of this plaque—about 6½ by 6 inches (16.5 by 15.3 centimeters)—and the fact that gems and ornamental metalwork are used to fill the area dictated by the codex it covers suggest a scarcity of ivory. Even in Milan, where two plaques depicting the life of Christ from the Washing of the Feet to his appearances after the passion were made, in imitation of a late antique diptych, ivory was a precious commodity. This explains the reuse of much older plaques in Carolingian domains to the north and suggests the value of a gift of "two ivory doors" said to have been obtained "from the Greeks" by Fortunatus, archbishop of Grado, and presented by him to Charlemagne in 807. Ivory may also have been rare in the south, and consequently there may have been a much greater use of bone. An ivory head, depicting a tonsured male but otherwise quite reminiscent of the images of consuls on diptychs, was found in 1991 at the monastery of San Vincenzo al Volturno, about 31 miles (50 kilometers) east of Monte Cassino; the excavators dated it to the first quarter of the ninth century. Two points must be made about this welcome discovery. First, the small size of the fragment—about 1¼ inches by 1 inch (3.1 by 2.7 centimeters)

speaks for itself. Second, and just as tellingly, the piece seems to have come from the debris of an atelier that produced objects in a variety of media. The eyes in the San Vincenzo head are inlaid glass beads, a practice more familiar in northwestern Europe.

Ottonian, Byzantine, and Islamic Presences (c. 950-1200)

During the tenth and eleventh centuries, only southern Italy— adjacent to Sicily, which was held by the Arabs; and with centers such as Amalfi, Salerno, and Bari that traded with the Arabs— seems to have had a regular supply of ivory. The so-called Vena-fro chessmen (found on the Volturno near Capua and now in the Archaeological Museum in Naples) evince strongly Islamizing forms, whether or not they were made by Muslim craftsmen. A plaque (now in the Musée Cluny in Paris) depicting Otto II and his Greek empress Theophano crowned by Christ has a marked Byzantinizing design and is apparently derived directly from a famous coronation ivory of Romanos II and Eudokia carved in Constantinople some forty years earlier. Yet both the imperial titlature (Latin terms written in the Greek alphabet) and the rather odd Greek on this Ottonian piece allow the possibility that it was carved in Byzantine southern Italy. A plausible suggestion has been made that the figure shown prostrate at Otto's feet is John Philagathos, the emperor's Calabrian tutor, who commissioned the object on which Otto is hailed as *Imp(erator) R(o)man(or)um*. If it was carved in 982, as many scholars suppose, it is contemporaneous with a plaque in Milan commissioned by Theophano, showing herself and Otto II kneeling and presenting their young son (the future Otto III) to an enthroned Christ. Ideologically akin, the two ivories show the different impact on Italian sculptors of Byzantine and Otton-ian demands.

Still, the tangled skein that results from any attempt to treat medieval Italian ivory carving as an entity cannot be reduced simply to differences among alien, northern and southern influences. A third strand, also indebted to both Greek and western models, is represented by boxes and plaques carved in Campania during the second half of the eleventh century. Both the dates and the precise origin of these pieces are widely disputed, the only evidence being their inscriptions (which are subject to various interpretations). One piece, in the treasury of the cathedral at Farfa, is a large casket—about 13½ inches (33.5 centimeters) long—carved from solid slabs of ivory, depicting scenes from the life of Christ and the Dormition of the Virgin. This box mentions Mauro, a known Amaffitan merchant, and his seven sons, one of whom died in 1072; thus it is supposed to have been made before that date. Another object (now in the Metropolitan Museum of Art) is a pen case with markedly Islamizing animal decoration; it bears the common Amalfitan name Manso and is consistent with Arab practice of using ivory for secular purposes. The Amalfitan names on these two pieces do not by any means indicate that they were made in Amalfi. They may have been made in Salerno, where the cathedral museum now preserves more than forty plaques of a so-called *paliotto* (altar frontal) that are related stylistically to the Farfa casket. These plaques are sometimes regarded as having belonged to a pair of chancel doors, but an altar frontal is an equally plausible origin. The pen case may offer a clue to a long and diverse series of oliphants: horns carved from hollowed elephant tusks and carved on their exterior with registers of real and fabulous animals in the manner of Fatimid horns, or scenes of chariot racing and circuses that derive from Byzantine and, ultimately, from late antique iconography.

Various other ivories, including a Last Judgment plaque (now in the Victoria and Albert Museum, London) that is strikingly akin to a mosaic of the same subject at Torcello, have been assigned to twelfth-century Venetian ateliers. A famous casket at Sens, with scenes from the life of David and Joseph on its twelve sides and its pyramidal lid, and an elaborate triptych at Chambéry were formerly considered Byzantine but are now recognized as departing from at least the established norms of Byzantine carving; their attribution to Venice may be due to little more than scholars' desire to identify a region beyond

Byzantium that was yet familiar with Greek conventions, and a Sicilian origin cannot be ruled out. Yet if evidence from other crafts (glass, rock crystal, enamels, and metalwork) is relevant, Venetian craftsmen in the twelfth and thirteenth centuries were highly adept at imitating both Byzantine and Islamic goods. A group of more than twenty-five plaques and a larger cluster of wooden boxes, sheathed with bone plaques in the manner of tenth-century Byzantine caskets, have been attributed to such "Italo-Byzantine" workshops. Since most of these boxes were preserved in northern Italian cathedral treasuries, a local origin for them is entirely possible. The distribution pattern of the plaques, which are often thoroughly Byzantine in their iconography but divergent in technique and style, is too random to sustain such a hypothesis.

From the Gothic Era to the Renaissance (c. 1200-1400)

By the thirteenth century, the importation of exotic materials had shifted from Campanian ports to Pisa and Venice. Not surprisingly, therefore, these cities figure among the chief centers, known or surmised, where ivory was worked during the Gothic era. In this period, for the first time, we are able to connect the name of a sculptor and a document of commission with a surviving work: in June 1298 Giovanni Pisano agreed with the cathedral chapter of Pisa (his native city) to complete by Easter of the following year a Virgin and Child in ivory, flanked by scenes of the Passion, for a *retable* for the cathedral. The main group measures about 21 inches (53 centimeters) high, indicating the ready availability of ivory that entered western Europe, and particularly France, from the Horn of Africa. Pi-sano's figures resemble his work in wood but are thoroughly northern, the Virgin and Child having been directly inspired by a marble group on the door of the north transept of Notre Dame in Paris. An ivory cup, adorned with images of the liberal arts, transformed into a chalice (and preserved in the treasury of the cathedral of Milan), is also French in inspiration.

Ecclesiastical objects, particularly crosiers, made of bone and carved or painted with images of local saints, are much more widespread than these ivories, and scarcely less important. One example (in the Museo dell'Opera della Metropolitana in Siena) is from the second quarter of

the fourteenth century. Similar pieces (in London and in the Bargello in Florence) bear the arms of contemporaneous bishops of Gubbio and Acerenza (Basili-cata). The diffusion of such fashions throughout the peninsula was matched by the traceable movement of craftsmen, among whom the Embriachi are perhaps best-known. The fame of the Embriachi family is encapsulated in the label *alia certosina*, referring to a great triptych in the Certosa of Pavia, for which a series of payment documents survive, drawn up in Venice between 1400 and 1409 in favor of its creator, Baldassare Embriachi, Baldassare was of Genoese origin but was first active in Florence, and he copied Florentine architectural niches in *retables* that he made for Philip the Bold of Burgundy and John, duke of Berry. These, like many boxes made in the same manner, consist of the bisected long bones of animals, each carved with a single figure, assembled to form groups. That technique was also applied to caskets with mythological representations, such as a history of Jason (now in the Victoria and Albert Museum) made in Florence at the end of the fourteenth century. Set within marquetry frames, these altarpieces and boxes began a fashion that lasted well into the fifteenth century. By then, ivory was nearly as available as bone and had ceased to be a highly desired substance. It was no longer a medium preferred by patrons or by the sculptors they employed, and in the Renaissance ivory working became a minor art.

Jacobus Da Voragine

Jacobus da Voragine (Jacopo da Varazze, c. 1228-1298) was a Dominican writer, administrator, and archbishop; his name suggests that he or his forebears came from Varazze, a town near Genoa. He entered the Order of Preachers—i.e., the Dominican order—as a youth, in 1244. After completing his education, he is reputed to have distinguished himself both as a public preacher and as a teacher of preachers in training, and also to have been prior (local head) of the Dominican community in Genoa. From 1267 on, his career is more clearly documented. His fellow Dominicans repeatedly elected him prior of the entire province of Lombardy, a post he held from 1267 to 1277 and again from 1281 to 1286. Both the order and the papacy entrusted him with sensitive diplomatic missions. From 1292 until his death, he was archbishop of Genoa, and he had such an exemplary reputation in this office that he was eventually beatified (in 1816).

Among the literary works Jacobus wrote or compiled, the earliest and most famous is a *Legenda sanctorum*, or anthology of readings about the saints, generally called *Legenda aurea* (*Golden Legend*). After the *Legenda*, Jacobus composed four large sets of Latin sermons, which evidently circulated as models for other preachers to use: *Sermones de sanctis*, on major saints and festivals of the church year; *Sermones de tempore*, on the Sunday gospels for the year; *Sermones quadragesimales*, on the weekday gospels for Lent; and *Mariale*, or *Laudes deiparae virginis*, sermons in praise of the Virgin Mary.

Jacobus's sermons survive in numerous manuscripts and early printed editions and thus must have enjoyed a wide and long-lasting popularity. His last major work, *Chronicle of Genoa*, which he wrote as archbishop, is noteworthy for the local history and hagiography it preserves and for some autobiographical passages that shed light on his own life.

Jacomo Dei Tolomei

Jacomo dei Tolomei (Iacomo di messer Lottorengo de' Tolomei; nicknamed Granfione, Graffione; fl. 1250–1300) lived in Siena and was one of the earliest Italian comic poets. His one extant sonnet, *Le favole, compar, ch'om dice tante* ("The many fables, my friend, that are told"), found in the Vatican Codex Barberino Latino 3953, is a parody of the bestiary similes that pervaded the serious love poetry of the time. In this sonnet, Jacomo compares animals and other creatures that populate Aesop's fables to several personages from Siena (including the comic poet Nicola Muscia, also known as Muscia da Siena), thus "proving" that Aesop's mythical creatures really existed. The comic comparison of

beasts to humans was a theme first made popular by Rustico Filippi.

Jacopo D'aquino

The poet Jacopo d'Aquino (d. after 1306) was the son of Adenolfo (*giustiziere* or executioner, of Sicily in 1231; d. 1243) and the grandson of Tommaso I, count of Acerra. After the death of Frederick II in 1250, Jacopo rebelled against Emperor Conrad IV, who later pardoned him and reinstated him in his possessions. Jacopo was forced by Charles of Anjou to abandon his fiefs in 1266, and his name is encountered in Charles's proscription lists for 1269-1270. Scandone (1904) uncovered a document showing that Jacopo was still alive in 1306.

Only one poem can be definitively attributed to Jacopo d'Aquino: *Al cor m'énato e prende uno disio* ("A desire is born in and takes hold of my heart"). Another, *Allegramente eo canto* ("Joyfully I sing"), though attributed to him in the Florentine Codex Laurenziano-Rediano 9, is more likely by Jacopo Mostacci, as established in the Vatican Codex Lat. 3793.

Jacopo Da Bologna

The Italian composer and music theorist Jacopo da Bologna (fl. northern Italy, 1340-c. 1360) was a member of the first generation of Italian *Trecento* musicians. He was evidently a native of Bologna and worked with Giovanni da Cascia at the Veronese court of Mastino II della Scala (d. 1351). Earlier, he had been linked to the Milanese court of Luchino Visconti (r. 1339— 1349); and after 1352 he apparently reentered the service of the Visconti family. The poet Petrarch may have been personally acquainted with Jacopo, whose madrigal *Non al suo amante* ("Not to her lover") is the only known contemporary setting of a Petrarch text. The music treatise *L'arte del biscanto misurato secondo el maestro Jacopo da Bologna* was influenced by French notational theory and raises the possibility that Jacopo may have been a university teacher. He may have lived beyond 1360; certain Aragonese records in Spain mention a similar personage between 1378 and 1386.

Thirty-four musical works can be positively attributed to Jacopo: twenty-five two-voice madrigals, seven three-voice madrigals and *cacce*, a *lauda-ballata*, and a motet. Most of his surviving work is contained in the Squarcialupi Codex (I-Fl 87). His popularity as a composer is attested to by the wide circulation of his music in northern Italian and Tuscan sources, and by mentions of his work in sources into the early fifteenth century. Many of his musical texts are autobiographical and hint at associations with Floriano, Philippe de Vitry, and Marchetto da Padova.

Jacopo's contributions to the development of the Italian madrigal include his textual emphasis, his motivic development between voices through imitation, and his use of monophonic transitional phrases between two lines of text. Tonal structure is important in Jacopo's music: most of his compositions begin and end on the same pitch. Three-voice madrigals make their first appearance in his compositions, and the first known *lauda-ballata* was also composed by him. Jacopo da Bologna's works had a profound influence on the next generation of *Trecento* composers—Francesco Landini and Bartolino da Padova.

Jacopo Da Lèona

Jacopo (fl., late thirteenth century), a poet from Lèvane, near Montevarchi in Tuscany, was among the first to use a comic style. His eight sonnets, all contained in the Vatican Codex Latino 3793, show the influence of two contemporaries—Guit-tone d'Arezzo and Rustico Filippi. Jacopo's best-known sonnet is *Signori, udite strano malificio* ("Gentlemen, listen to the unusual scheme"), in which he mocks Rustico Filippi in the comic style that Rustico first popularized. Rustico's influence is also seen in three sonnets in dialogue form, in the tradition of serious courtly love poetry. Jacopo's *Contessa è tanto bella e saggia e cónta* ("Contessa is so beautiful and wise and gracious") is reminiscent of Guittone. Guittone, in his *canzone Comune perta fa comun dolore* ("Common loss makes for common grief"), praised Jacopo as a great poet.

Jacopo Da Milano

The Franciscan lector Jacopo da Milano (Jacob of Milan, James of Milan, Jacobus Mediolanensis, Giacomo da Milano; thirteenth century) was the author of the original version of a spiritual classic in Latin, *Stimulus amoris* (*Prick of Love*). Much has been surmised but little is known for certain about Jacopo. From the date of the earliest evidence for the *Stimulus amoris*, and from the acquaintance it shows with the writings of Saint Bonaventure, Jacopo must have composed it in the second half of the thirteenth century. Jacopo has been plausibly but not conclusively identified with a Brother James of Milan recorded as a lector at the Franciscan convent at Domodossola in 1305. Some scholars have thought him identical or possibly identical with a mid-thirteenth-century Milanese theologian who was known until 1979—incorrectly—as Giacomo Capelli or de Capellis; but this person is no longer credibly a Jacopo. Jacopo could well have been the renowned Franciscan, formerly a lector in Milan, who sometime after 1296 read and approved Arnaldo of Foligno's *Memorial* on the mystic and visionary Angela of Foligno. One modern scholar has ascribed to Jacopo a meditation on the hymn *Salve Regina*, transmitted in some of his manuscripts and at times attributed to Bernard of Clairvaux (among others), but this idea has not found widespread acceptance.

Recent investigation has revealed *Stimulus amoris* in its Jacopean form to be an unstable "open text" whose very title is uncertain. As now

edited, it consists of a prologue and twenty-three brief chapters; the first nine chapters guide the reader toward divine rapture, and the rest deal with other aspects of the contemplative life. The writing style is often intense and rhetorically effective; it combines direct address, exclamation, and figures of repetition with an intentionally simple vocabulary. Chapter 14, an especially vivid meditation on Christ's passion, is thought by some to have furnished the theological basis for the imagery in the window of the Glorification of Saint Francis in the upper church of Francis's basilica at Assisi. However, the ideas in question were common in later thirteenth-century Franciscan contexts, and the dating of both the window and the earliest version or versions of the text is uncertain.

Jacopo's *Stimulus* circulated with Bonaventure's works, was soon mistakenly attributed to Bonaventure, and was expanded twice in the fourteenth century by persons unknown. Modern scholars differentiate these texts by calling the original *Stimulus (amoris) minor* and the expansions (treated as a single version) *Stimulus (amoris) maior*. The *maior* was more widely read: there are more than 130 manuscripts of it, as opposed to some ninety manuscripts of the *minor*. A recent suggestion that the *maior* was actually the original seems unpersuasive. Starting in the later fourteenth century, this very different larger version was translated into other European languages, including English. A fourteenth-century translation (now lost) of *Stimulus minor* into Tuscan dialect is thought to underlie its first printing in Italian (Venice, 1521).

Jacopo De Cessolis

Jacopo (Jacobus, fl. 1275-1322) was born in the small town of Cessole, near Asti, in Piedmont. He entered the Dominican order, probably at the convent of Santa Maddalena near Asti. From 1317 to 1322, he lived in Genoa, where he became vicar of the Inquisition attached to the convent of San Domenico. At the request of fellow Dominicans and several laypeople, he wrote his only extant work, *De moribus hominum et de officiis nobilium super ludo scaccorum* (*On the Customs of Men and Their Noble Actions with Regard to the Game of Chess*), known simply as *Ludus scaccorum*.

Ludus scaccorum is a moralized explanation of chess based on the medieval estates, whereby each chess piece represents a different social class. It consists of twenty-four chapters divided into four sections (*tractatus*). The first section consists of three chapters that narrate when, how, and by whom chess was invented. The narrative, in the form of a medieval *exemplum*, recounts how a Greek philosopher named Xerxes or Perses invented the game to show his cruel king Evilmerodach "the maners and condicions of a kynge of the nobles and of the comun people and of theyr offices and how they shold be touchid and drawen. And how he shold amende hymself & become vertuous." Xerxes explains that he invented the game to keep the king from "ydlenesse," which can induce men to sin, and to satisfy man's desire for "noueltees & tydynges," which in turn sharpen the mind. The *exemplum* ends with Evilmerodach's eventual conversion, thus setting a precedent for using chess to teach people how to behave.

The second section is divided into five chapters describing, respectively, the five different chess pieces in the first row: (1) king, (2) queen, (3) alphinus (judge), (4) knight, and (5) rook (legate). Each piece is described in terms of its clothing, its symbols of power, the moral significance of those symbols, and—most important—the way a represented by the piece must behave in society. Jacopo narrates several *exempla* to illustrate the kind of behavior he has in mind for each person.

The third section deals with the pawns and is divided into eight chapters, each taking up a particular group of commoners (one pawn

representing one group): (1) laborers (farmers), (2) smiths, (3) notaries, (4) merchants, (5) physicians, (6) innkeepers, (7) city watchmen and guards, and (8) ribalds and town couriers. Each pawn is described in terms of the tools of its trade, its relationship to the chess piece behind it, and how the person represented should behave. For each group of commoners, Jacopo narrates one or more *exempla*, illustrating either appropriate or inappropriate behavior of that group.

The fourth section is also divided into eight chapters. The first chapter describes the chessboard as an allegorical representation of Babylon, where the game was presumably invented. The next six chapters deal with the actual moves of each chess piece on the chessboard. These moves reflect the rules of chess that were then in effect in Lombardy and are allegorized to illustrate a moral. For example, when a pawn becomes a queen, the fact that many great rulers had humble origins is illustrated. In the eighth chapter in this section—the final chapter—Jacopo reiterates the history of the origins of chess, reminding his readers that chess is a social allegory of the various classes of medieval society working together for the common good.

As Kaeppli (1960) noted, the convent of San Domenico in Genoa produced a considerable amount of popular religious literature. It is not surprising, therefore, that *Ludus scaccorum* spread rapidly throughout western and eastern Europe; there were even a Scottish translation and a Czech translation. When *Ludus scaccorum* was translated from Latin into a vernacular, or from one vernacular into another, the content was sometimes modified to reflect a country's particular ways of representing its own social classes (Buuren 1997).

The diffusion and popularity of *Ludus scaccorum* during the fourteenth and fifteenth centuries are reflected in the numerous manuscripts and early printed editions of the work. It was the second book to be printed in the English language: William Caxton printed an English translation of Jehan de Vignay's French translation (c. 1350) of *Ludus scaccorum* in 1474. Despite the popularity of *Ludus scaccorum* in the late Middle Ages and the early Renaissance, there are no critical editions in print of the Latin original, nor are there any modern translations in either English or Italian. There are, however, modern critical editions of Jean Ferron's French translation of 1347 (the best of the medieval French translations), and of the Middle Scots translation of

Jacopo Mostacci

Jacopo Mostacci (fl. 1230-1260) was the author of four *canzoni*, written in a refined, Provençalizing style, and he participated with Giacomo da Lentini (the Notary) and Pier de la Vigna in a *tenzone* on the nature of love. Jacopo is referred to as *messere*, a title indicating a man of considerable social status. Some scholars suggest that he may be identical with the falconer whom Frederick II sent on an expedition to Malta in 1240, and who, in 1262, accompanied Manfred's daughter Costanza on her wedding journey to Aragon. Scandone (1904) traced the Mostacci family to Messina, and Torraca (1902) suggested Lecce as its place of origin. The scribe of manuscript Palatino 418 (Florence, Biblioteca Nazionale Centrale, now Banco Rari 217) proposed that Jacopo was of Pisan extraction, but this theory has few adherents.

Jacopone Da Todi

The Franciscan friar and mystic Jacopone da Todi (Jacobus de Benedictis, Jacopus de Tuderto, Jacopo de' Benedetti, Giacomone de' Benedetti; c. 1230 or 1236—1306) is considered by some to be Italy's greatest poet before Dante. The principal type of verse that Jacopone used is the *lauda*, a nonliturgical song of praise in vernacular ballad form, although some works in Latin are also attributed to him.

Details about Jacopone's life before his religious conversion are sketchy, but it is generally accepted that he was born (as his name implies) in Todi, Umbria, to a family of the lesser nobility. He received an education typical of his time and social class (he may have studied

at the University of Bologna) and then is believed to have practiced the profession of notary in Todi and, in his mid-thirties, to have married Vanna di Bernardino di Guidone, of the counts of Collemedio (or Coldimezzo). According to early *vitae* (lives) of Jacopone, Vanna's accidental death at a party devastated him, provoked a profound psychological crisis, and led to his religious conversion in 1268. The precipitating factor in this rapid chain of events appears to have been his discovery that Vanna, like many others during this tumultuous period of Italian history, had practiced self-mortification as a form of religious penance—in her case, by wearing a hairshirt under her beautiful and costly outer garb. To the consternation of his family and the disbelief of his fellow citizens, Jacopo divested himself of all his worldly goods and habits and became a *bezocone*, or mendicant Franciscan tertiary (*Laude*, ed. Mancini, 1974, 151). For the next ten years, he traveled the highways of Umbria, singing God's praise and preaching salvation, not in the Latin of the church but in the language of the people, as was the custom of the Franciscans. In 1278, on his second request, he was finally admitted to the order of Friars Minor (i.e., the Franciscan order; Casolini 1966,620). He thus became Fra Jacopone—a name that can be translated as Big Jim or Big Jake.

In the years following the death of Saint Francis (1226), the Franciscans split into two opposing camps. The Spirituals believed in the strict interpretation of Francis's rule, which called for complete poverty; the Community, sometimes referred to as the Conventuals, supported a more relaxed interpretation that permitted ownership of property and other material comforts. Jacopone sided with the more extreme Spirituals and, as a consequence, found himself locked in the bitter and sometimes dangerous struggle between the two factions. When Boniface VIII became pope, Jacopone allied himself with the Colonna family, Boniface's enemies. Jacopone's open and virulent opposition to the powerful new pope earned him excommunication and five years of solitary confinement.

While he was in prison, Jacopone wrote many *laude*. In one of them—*Que farai, fra Iacovone?* ("What will you do, Brother Jacopone?" number 55 in Ageno's edition, 53 in Mancini's)—he comments with mordant irony on the dire conditions of his imprisonment. We know from two *laude*—*O papa Bonifazio/io porto el tuo prefazio* ("O Pope

Boniface, I bring your sentence," number 56 in Ageno and 55 in Mancini) and *Lo pastor per mio peccato/posto m' à for de l'ovile* ("Because of my sin the shepherd has cast me out of the sheepfold," number 57 in Ageno and 67 in Mancini)—that Jacopone twice begged the pope for absolution. Although the pope granted absolution to many in the jubilee year of 1300, Jacopone was not among them. In 1303, however, Jacopone received personal liberty and release from religious censure from Boniface's more compassionate successor as pope, Benedict XI.

The elderly Jacopone then retired to the convent of San Lorenzo in Collazzone, where he died on Christmas eve, 1306. In 1433, his remains were discovered in the convent of Santa Maria di Montecristo, and in 1596 his tomb in the crypt of the Franciscan church of San Fortunato in Todi was dedicated. Although he has not been beatified or canonized by the church, Jacopone is inscribed in the Franciscan martyrology and is popularly referred to and venerated as "blessed" or "saint."

Jacopone wrote approximately 100 *laude* in the Umbrian vernacular that express the mystic's innermost sentiments about the state of his soul and seek to instruct others who are seeking greater closeness to God. Unlike many *iaude* composed by others at this time (which was the form's most fertile period), Jacopone's hymns were written not for the general lay public but for his own personal use, and possibly for his Franciscan brothers. Jacopone's *laude* treat a wide range of subjects and present a variety of tones and moods. His important themes include the following (for each example, the number in Ageno is followed by the number in Mancini): praise of God (e.g., *La bontade enfinita*, "The infinite goodness," 79, 21), Christ (*Adl'amor ch'è venuto*, "To the Love that came," 65, 86), and the Virgin Mary (*O Vergen piú che femina*, "O Virgin more than woman," 2, 32); Saint Francis and the Franciscan ideal of poverty (*Povertade enamorata*, "Beloved poverty," 59, 47); the condemnation of all types of secular temptation (*Guarda che non caggi, amico*, "Be careful not to fall, my friend," 6, 20); detailed descriptions of disease, death, and dying (*Quando t'alegri*, "When you are glad," 25, 61); soul-searching self-criticism (*Que farai, fra Iacovone?* "What will you do, Brother Jacopone?" 55, 53); extreme self-abnegation (*O Signor, per cortesiajmandame la malsania*, "O Lord, please infect me with disease," 48, 81); biting political satire (*Que farai, Pier da Morrone?* "What will

you do, Pier da Morrone?" 54, 74); laments on the state of the church (*Piange la Ecclesia*, "The church weeps," 53, 35); descriptions of the mystical state of ecstasy, akin to madness, that the poet entered during his spiritual meditation (*Senno me pare e cortesia*, "It seems to be wise and courteous," 84, 87); and the passionate praise of divine love (*O iubilo del core*, "O heartfelt joy," 76, 9; and *Sopr'onne lingua amore*, "Ineffable love," 91, 92). Misogyny is patently evident in some of his *laude* (e.g., *O femene, guardate*, "Women, beware," 8, 45), revealing Jacopone to be a man of his time. However, there is also evidence that he gave some thought to the difficult living conditions of many women in the late thirteenth century (e.g., *O vita penosa*, "O sorrowful life," 24, 58). One simple yet supremely elegant *lauda*—*Donna del paradiso* ("Lady of Paradise," 93, 70)—is important because it represents the pinnacle of Jacopone's poetic art and also because it constitutes a crucial step in the evolution of Italian religious theater: it has four speakers, and many scholars consider it the first religious drama in Italy.

Although critics are not in complete agreement regarding Jacopone's authorship of a number of works in Latin, the following have variously been attributed to him: the famous sequence *Stab at mater dolorosa*, now a part of the Roman Catholic liturgy; pithy moral sayings known as the *Dettk* and *Trattato* (*Treatise*), whose subject is mystical union with God.

James II, King of Aragon

James II of Aragon (James I of Sicily, James the Just, James the Honest; 1264-1327) played a crucial role in the history of the Italian islands, and this aspect of his career will be emphasized here. He was the second son of Peter III of Aragon, under whose will he inherited Sicily (1285), while his elder brother Alfonso became king of Aragon and Valencia and count of Barcelona. James's task was therefore to sustain the Hohenstaufen inheritance of his mother, Constance, during the bitter war of the Sicilian Vespers against the claims of the house of Anjou. His reign in Sicily began with a coronation at Palermo in February 1286, during which he promised to respect the liberties of his subjects. However, he also had to face papal conspiracies to subvert the island, and his offer to become a papal vassal was sternly rejected by Pope Honorius IV, who considered the offer presumptuous and excommunicated James. The pope also rejected peace initiatives supported by Charles II of Naples, a captive in Catalan hands. An attempt by the papacy to capture Augusta in Sicily met with humiliating failure (1287) when the Aragonese trounced the Angevins in the waters off Naples.

James's wish for peace took a new turn in 1291, when he inherited the Spanish lands of his childless brother Alfonso; the return of Sicily to the Angevins in exchange for another territory became fundamental to the ensuing negotiations. James refused to agree to the terms of Alfonso's will, according to which he would cede Sicily to their youngest brother Frederick, who was merely appointed lieutenant-governor. The Sicilians were displeased by the negotiations to return the island to the Angevins and expressed their displeasure in 1295 by elevating Frederick to the throne. By 1297, James had maneuvered himself into a position where Boniface VIII granted him the title to Sardinia and Corsica in exchange for a promise that James would

abandon Sicily. Sardinia—a potentially valuable source of grain, silver, and pastoral products—had been an objective of the Aragonese since at least 1267, when James I of Aragon had tried to secure the island for his second son, James of Majorca. After 1297, James II of Aragon added to his titles that of *rex Sardinee et Corsice*. However, as a result, James had to join the Guelf-Ange-vin war against his brother in Sicily. He provided some troops for the war, though never on a very large scale. He also led his armies, unsuccessfully, in an assault on eastern Sicily (1298), and thereafter spent some time on the mainland; but he returned to Spain in 1299. His admiral Roger de Lauria did inflict a severe defeat on the Sicilian navy at Cape Orlando in 1299. By now, however, James had clearly secured most of what he really wanted. His letters continued to show affection for his brother Frederick even while they were officially at war. James's attention shifted to Sardinia once the treaty of Caltabellotta (1302) had secured Aragonese rights in Sicily in the medium term.

Sardinia was dominated by Pisan and Genoese interests, and the Pisans' fears of intervention by the Aragonese led to proposals that Pisa should submit to Aragonese rule, in the hope of being able to share the benefits of conquest. These proposals did not come to anything. In 1323, however, James exploited an alliance with the powerful native judges of Arborea to invade Sardinia. The Arboreans were hoping to play off the Aragonese against the Pisans, a declining force on the island since their defeat at Genoese hands at Meloria (1284). It would be more accurate to call this an invasion than a conquest, since the Aragonese soon broke with their Arborean allies, and James began to distribute prizes to those who had supported him in the campaign: Catalan soldiers, Majorcan merchants, and Jewish businessmen from Spain. The Pisans managed to hold onto some lands in the south, but the Genoese vigorously opposed the invasion, and these events marked the beginning of a long, bloody, and bitter rivalry between Genoa and the Catalans in the western Mediterranean. Sardinia (and notionally Corsica, which was not attacked until the next century) was subsumed into the "Privilege of Union" of 1319, according to which, whoever was king of Aragon and Valencia, was also count of Barcelona; unlike Majorca and Sicily, it never acquired a cadet ruler from the house of Barcelona. However, the Catalan settlers soon grew discontented with their lot in the harsh

setting of an island that lacked the sophistication of earlier Aragonese conquests such as Sicily and Valencia, and Sard rebellions prompted many to return home to Spain.

James's great strength lay in able diplomacy, which secured him control of the Val d'Aran in the Pyrenees (1312). He was an effective administrator and an enthusiastic letter writer. His role alongside Castile in the conquest of Muslim territories in Spain revealed high ambitions, but they were dashed. The campaign of 1309 against Almeria and Gibraltar did not secure its objectives. Increasingly, James's involvement in Sardinia distracted him from grandiose plans for crusades in Spain and North Africa. His relations with his nephew James II of Majorca, whom he would gladly have dispossessed, were often poor. On the other hand, he had good relations with Islamic rulers in the Levant, gaining recognition from the Mamluks of Egypt and Syria of his protectorate over Christian churches in the east. He was a patron of the mystic and missionary Ramon Llull and of the mystic and physician Arnau de Vilanova. Indeed, James's hypochondria knew no bounds, and it was said that by the end of his life he would not go two paces without a doctor at hand. By the time he died, in 1327, James had proved that his wiliness could produce enormous dividends. Sicily had not, after all, returned to the house of Anjou, and he had gained Sardinia all the same.

Jaufre Rudel

Jaufre Rudel (c. 1100-c. 1147) was lord (*princeps*, prince) of Blaye at the northern shore of the Gironde River in France; he participated in the crusade of 1147, from which he seems not to have returned. Like his overlord and model, William IX, count of Poitiers and duke of Aquitaine, he cultivated literature.

Jaufre's name is associated with two *topoi* (literary commonplaces) in which the paradox of courtly love is concretized: love from afar and passion for a lady the poet has never actually seen. Six poems ascribed to him in the manuscripts are authentic; a seventh is doubtful. These poems have a mystical background and demonstrate a refined sensuality, especially in their descriptions of hopeless longing, as in the famous *Lanquan li jorn son lone en mai* ("When the days are long in May, / I love the sweet song of the birds heard from afar, / and when I have left from there, / I remember a love from afar"). The yearning for love from afar led to a well-known legend of a lady whom Jaufre had never seen, the countess of Tripoli; he is said to have endured a difficult sea voyage in order to see her and to have died in her arms. This legend has inspired writers since the thirteenth century, including Petrarch, Stendhal, Heinrich Heine, and Giosuè Carducci. However, other troubadours, contemporary and later, attacked Jaufre for using mystical elements ordinarily reserved for religious poetry and for being too restrained toward women.

Jerome, Saint

Saint Jerome (Eusebms Hieronymus, c. 331–30 September 420) was born into a wealthy Christian family at Stridon in Dalmatia. He was the eldest of three children. All the sources reveal that Jerome was a difficult man: he was irascible and held strong opinions that made him quick to participate in any controversy. These characteristics made his life somewhat stormy, but the controversies generated a volume of Christian literature that was profoundly influential.

Jerome apparently received an education in the best classical Roman tradition and went to Rome to continue his studies in the early 340s. He stayed in Rome for ten to twenty years. During that time he became friends with Christians who advocated strict asceticism—notably Rufinus, with whom he later engaged in a bitter dispute. We have little information about Jerome's early years in Rome. However, we know that they ended with one of his perennial conflicts. Jerome had become involved in a scandal about which we have no details but which was enough to make him leave Rome to seek an ascetic life in the east.

In 372, he went to Antioch, where he was well received by Emperor Valens. While Jerome was in Antioch, he had a dream in which Christ accused him of being a disciple of Cicero, not of Christ. This famous dream expressed a conflict that confronted many classically educated Christians. Jerome responded by applying his talents more vigorously to Christian literature, although he later returned to his beloved classics.

A few years later, he retreated to the Syrian desert (near Chalcis) to lead an ascetic life. During this retreat, he kept his extensive library and continued his studies. He learned Hebrew, a skill that would have far-reaching consequences for his biblical scholarship.

Around 377, Jerome discovered that his retreat in the desert had not allowed him to avoid contention. He became involved in a Trinitarian dispute with other monks, and the bitterness of the conflict led him to leave the desert for Antioch and then Constantinople. Finally, c. 382, he

returned to Rome and took a central place in Roman Christian society.

Saint Jerome. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle).
Nuremberg: Anton Koberger, 1493, p. 135r.

In Rome, Jerome worked as secretary to Pope Damasus I. However, Jerome had an even stronger influence within the great Roman families. Several aristocratic widows were drawn to an ascetic life, and Jerome became a spiritual guide to some of them. Two of these women—Marcella and Paula—offered their households as meeting places for other religious women, and Jerome often attended the meetings, teaching scripture and encouraging the women's educational and ascetic pursuits. Paula and one of her daughters, Eustochium, of the noble family of the Aemilii, became Jerome's close companions until their deaths.

Jerome advocated a rigorous asceticism that required extreme fasts, reclusiveness, and a profound regard for chastity. He defended these positions vehemently against all critics. In 383, Helvidius (a figure about

whom we have little information) published a pamphlet trying to vindicate marriage in the face of a growing tendency to exalt celibacy; he argued that Mary had lived a full married life after the birth of Jesus. Jerome's tract *Against Helvidius* was influential in making belief in the perpetual virginity of the Virgin Mary orthodox. A decade later, Jerome again responded to a critic of Christian celibacy—Jovinian, a Roman monk. Jovinian argued that chastity brought no religious advantage over fidelity within marriage and, echoing Helvidius, claimed that Mary had not remained a virgin after Jesus' birth. Jerome responded so vigorously in his tract *Against Jovinian* that many members of Roman society accused him of being opposed to marriage. Such tracts and Jerome's voluminous correspondence with ascetic men and women form a body of thought that remained a force in monasticism and asceticism throughout the Middle Ages.

Jerome's acerbic style continued to cause him trouble. His satiric comments and his often self-righteous prose offended many, and his uncompromising advocacy of strict asceticism created further problems. One of Paula's daughters, Blesilla, had been widowed when she was twenty years old. Under Jerome's influence, she undertook such severe bodily mortification that she died four months later. Many people in Rome blamed Jerome for her death. Furthermore, Jerome's close friendship with Paula had raised questions of propriety. Therefore, in 385, after the death of his patron Pope Damasus, Jerome left Rome again for the Holy Land. Paula and Eustochium followed him, and the three founded monasteries and settled in Bethlehem. Jerome would not return to Italy, but he continued to influence the west through his correspondence.

In Bethlehem, Jerome completed his most influential works. He prepared a new Latin translation of the Old Testament and the Gospels. For the Old Testament, Jerome translated from Hebrew scriptures instead of from the Greek Septuagint with which the west was most familiar. During his lifetime, he probably received the most criticism for presuming to tamper with the scriptures. Even Augustine wrote to him, asking him to avoid using the Hebrew texts and to work only with the Septuagint. Perhaps fortunately, Jerome did not receive Augustine's cautionary letter, so these two church fathers remained on good terms, and Jerome continued his significant translating. Augustine's concerns

reflected the feelings of many Christians of the time about new scriptural translations, yet Jerome's biblical work was his most enduring achievement. His Latin translation formed the major part of the Vulgate version of the Bible that was accepted for centuries.

Jerome also began a series of Biblical commentaries that were very influential. These commentaries relied heavily on an allegorical interpretation of the Bible that owed much to the Alexandrian theologian Origen (c. 185-254), whom Jerome and his friend Rufinus admired. Jerome's debt to Origen led him into yet another controversy, which ended his longtime friendship with Rufinus. In 393, the bishop of Salamis found certain errors in Origen—Origen's view of the Trinity, his belief in the preexistence of souls, and his allegorical interpretations of creation and paradise—and consequently banned Origen's writings. Jerome immediately renounced Origen, to whom, however, Rufinus and an influential companion, Melania the Elder, remained loyal. Jerome and Rufinus were to spend the rest of their lives defending their respective positions. In 400, the Origenist controversy spread to Rome. Jerome translated and circulated John Chrysostom's renewed condemnation of Origenist thought, and Pope Anastasius I confirmed the condemnation. The Romans followed the continuing controversy through a public correspondence between Jerome and Rufinus.

Jerome took up his next major dispute in 411, when Pelagius came to Palestine from Rome. Pelagius's ideas had been condemned in Rome, and Jerome continued a debate that Augustine had begun. Pelagius attacked what he believed was Jerome's deprecation of marriage in *Against Jovinian*, and he further offended the contentious Jerome by claiming (quite correctly) that Jerome's biblical commentaries had been influenced by Origen. Jerome built on Augustine's anti-Pelagian writings as he articulated the orthodox position on the importance of grace to human will. Jerome's most famous anti-Pelagian work is *Dialogue against Pelagius*.

In 416, Jerome's monasteries in Bethlehem were attacked and burned. Jerome, Eustochium, and Paula's granddaughter (also named Paula) escaped unharmed. Pelagians were accused of the attack, and the accusation caused the weight of public opinion in the Holy Land to shift away from Pelagius; the heresiarch had to leave Jerusalem. This incident ended Jerome's involvement in the Pelagian controversy.

Jerome and Eustochium continued to live in the damaged monastery at Bethlehem.

Jerome's works continued to be read after his death in 421), and as time passed they became even more influential. In the eighth century, Jerome was acclaimed as one of the four doctors of the church (the others were Ambrose, Augustine, and Gregory the Great); Pope Boniface VIII formally ratified the title in 1295. This acclamation meant that the church considered Jerome's writings worthy of study by the faithful.

Jerome was primarily a scholar. He devoted himself to his books and writings; as we have seen, he took both into the desert with him when he sought an eremitic life. During the Renaissance, humanist scholars admired his scholarship and recognized him as a Latin stylist. Erasmus published the first collected edition of Jerome's writings. The many scholarly writings by Jerome, particularly his contribution to the Vulgate Bible, advanced Christian theology and devotion. Jerome was also influential in helping to legitimize monasticism in the west as a central Christian institution. Finally, Jerome's advocacy of asceticism, celibacy, and veneration of the Virgin Mary left an enduring mark on medieval Christianity.

Jews in Italy

By the fourth century, the Jewish communities of Italy were undergoing various changes for the worse. After more than 400 years of successful acculturation (despite occasional setbacks) to the relatively tolerant and polytheistic society of Rome, their status and numbers declined progressively during the Christianizing of the Roman empire. Recognized as a *religio licita* (a legal entity) by pagan Rome, Jews had enjoyed citizenship, as individuals or collectively, since a decree of Caracalla in 212. Jewish proselytism was still allowed and was even effective in the late empire, especially among noblewomen. Jews interacted in all areas of pre-Christian Roman society from jurisprudence and academics to shipping and manufacturing. The

majority of Jews, however, were proletarian and, though found throughout the population centers of Roman Italy, were centered in urban Rome. Their overall number has been estimated at 50,000 during the second century. The pre-Christian rulers beginning with Julius Caesar allowed Jews certain privileges based on traditional Jewish religious laws, and these privileges continued to structure the status of Jews through the Middle Ages. Yet the Jews of Rome were continually reminded of their lost independence: the Arch of Titus (still extant) recorded their exile; and the sacred objects of Jerusalem's destroyed temple, depicted on the arch, reposed in the *templum pacis* (temple of peace) on the Capitoline hill until the fifth century.

Scholars have reconstructed the legal and social status of the Jews during the fourth and fifth centuries from the Theodosian code, the writings of the church fathers, and Christian councils. The emperors from Constantine I to Theodosius II restricted the rights of Jews as Roman citizens. Constantine began the process of excluding Jews from the military, political, legal, social, and economic life of the empire. His law of the decurions was a burden on wealthy Jews but attests to their economic success in urban centers. Constantius, his Arian successor, prohibited marriage between Jews and Christian female workers in imperial garment factories. Jews were prohibited from circumcising slaves and from proselytizing in general. Although this hostility toward Jews on the part of the Christian emperors was reversed by Julian (361-363), it was reintroduced by Theodosius I (383), who actively promoted Christianity against pagans and Jews. The code of Theodosius II concretized the earlier (generally ad hoc) laws to establish second-class citizenship for Jews. Undoubtedly, many Jews converted to the dominant religion during the century from Constantine to Theodosius II.

The Christianization of the empire was aggressively promoted by the newly developed monastic movement. Pagan temples and synagogues were sanctified as churches, often forcibly, if not destroyed. Theodosius I protested these unlawful actions, particularly in the case of the synagogue of Callinicum (388). However, he did not punish the perpetrators but backed down in the face of a spirited protest from Ambrose of Milan. Therefore, in 393 Theodosius had to repeat his prohibition of the interdiction of Jewish practice and the destruction of

their synagogues. Jews were restricted by law from building new synagogues but were generally allowed to repair older buildings.

Church councils in Italy and throughout the empire listed anti-Jewish canons intended to segregate Jews from Christians. These included bans on marriage, sexual relations, eating or bathing together, discussing the scriptures, and even exchanging gifts on holidays. The intent in the fourth century seems to have been to protect a developing Christianity. By the fifth century, the church had become the official religion of the empire, and its canons were treated as law by the emperor. Thus twofold legislation against Jews and Judaism can be traced in the secular and ecclesiastical literature of the fourth and fifth centuries. Judaism, however, remained a *religio licita*, and the Jews maintained their status as Roman citizens despite the increasing restrictions placed on them.

During the fifth- and sixth-century invasions of Italy, the Jews suffered along with their fellow citizens, but under the Arian Goths their situation improved. Breviaries of the Theodosian code, including some of its anti-Jewish laws, were interpreted liberally by both kings (e.g., Theodoric) and popes (e.g., Gelasius); and the Orthodox Christians' animosity toward Jews was muted because the Arian kings used Jews for administrative and economic support. During the Byzantine reconquest of Italy, Jews fought alongside the Goths, especially during Belisarius's siege of Naples in 536. After the Byzantine reconquest, Justinian further denigrated Judaism in his code and placed restrictions on Jews, including an interdiction against the teaching of rabbinic Judaism. Despite these setbacks, though, Byzantine Italy was to remain the main area of Jewish settlement.

In the Jewish community of Rome, which maintained an unbroken continuity from the days of the republic through the twentieth century, entered a new stage under the papacy. Gregory I (590-604) mentioned the Jews in twenty-eight of his letters, and these formed the basis of later popes' attitudes toward them. Officially, Jews were allowed to fully enjoy their circumscribed status as defined in the Theodosian Code, but no more than that. This phraseology, initiated by the words *sicut Iudaeis*, was to prefix every papal bull to the Jews beginning with Calixtus II (1119-1124). Gregory, as the last bureaucratic representative of the empire in the Latin west, protected the economic and religious

rights of the Jews in Italy (especially in Rome, Naples, and Ravenna, but also in Sicily) and southern France against forced conversion and the destruction of their synagogues, while permitting them some leeway in the slave trade (the latter out of necessity, since the papal estates needed slaves). At the same time, he authorized his overseers in Sicily to bribe poor Jews to convert, arguing that the children of the converts would become good Christians. This policy gave effect to Augustine's balanced treatment in his homiletic commentary on Psalm 59:12: "Slay them [the Jews] not, lest My people [the Christians] forget."

Inscriptions by Jews in Greek, Latin, and (increasingly from the seventh century on) Hebrew attest to their presence in southern Italy, especially in Venosa. An eleventh-century Hebrew chronicle in rhymed prose known as *Megillat ahimaaz* provides a folklorish narrative of a prominent Jewish family in Oria through the ninth and tenth centuries. Written in the contemporary style of hagiography and emphasizing the mystical and the miraculous, it is our primary source for tracing Jewish fortunes in Byzantine Italy as well as for outlining the beginnings of a renaissance of Hebrew literature and poetry. Subsequent research in the rich liturgical collections emphasized the continuity of Palestinian poetic traditions in southern Italy and the role of southern Italy as an intermediary in the further development of these traditions in the German Rhineland from the eleventh century on. The classical *piyyut* of Palestine was codified, so to speak, during the tenth and eleventh centuries and was succeeded by the new poetry of Spanish Jewry's golden age. Alongside this Sephardic tradition the new Italian poetry of the thirteenth century was absorbed into Hebrew, producing a mellifluous Italian legacy to Renaissance Jewry.

Historiography reached its high point with the appearance of *Sepher yosippon*, an extraordinary history of ancient Israel derived from the Vulgate and from Josephus, and written in a superlative mix of biblical and later Hebrew. The anonymous author interweaves the legendary history of Rome with biblical and postbiblical events down to the destruction of the Second Temple and Jerusalem in 68 (according to medieval Italian reckoning). Fragments of the book of Maccabees and a chronicle of ancient rulers to 962 were also produced. In medicine, astronomy, and mysticism, the works of Shabbetai Donnolo of Oria rank as extremely important, not least for their continued use by Jews

and Christians throughout the medieval period. Valuable collections of rabbinic texts also make their appearance. In the eleventh century, a Hebrew rendering of Pseudo-Callisthenes's *Deeds of Alexander* attests to an interest in general culture. This Hebrew renaissance is characterized by a twelfth-century pun on Isaiah (2:3) substituting two southern Italian cities for Zion and Jerusalem—"The teaching (of Moses) came forth from Bari and the word of the Lord from Otranto."

From another perspective, this renaissance witnessed the migration of Jews (e.g., Kalonymos ben Kalonymos of Lucca) to the Rhineland at the invitation of the Saxon emperors. The immigrant Jews were to found, or reinforce, communities in Speyer, Worms, and Mainz that flourished until their destruction during the First Crusade. At the same time, there were vicissitudes under the Macedonian house in Constantinople: forced conversions by Basil I (873–874) and Romanus I Lecapenus (932–936) and inevitable disruptions during the Italian wars of Alexander and Constantine Porphyrogenitus (Bowman 1986, 54–57) and during the Muslim conquest of Sicily, Apulia, and Calabria. (Shabbetai Donnolo, for example, was enslaved by an Arab raiding party in 925, an experience that allowed him to study medicine and astronomy from Arabic as well as Greek sources.) Islam had a generally more tolerant attitude toward Jews; as a result, their condition improved during the tenth and eleventh centuries despite the imposition of land (*kharadj*) and poll (*jizya*) taxes. Sicilian Jews were to maintain an Arabic culture well after the Christian reconquest. The destruction of Bari in 1071 signaled the beginning of a shift of Jewish centers to Rome and later, at the end of the thirteenth century, to northern Italy.

Under the qualified protection of the popes, the Jews of Rome flourished from the eleventh century on, producing important medical, financial, and literary figures. Nathan ben Yehiel *min ha-anavim* created his *Arukh*, an encyclopedia of postbiblical Hebrew that is still valuable. Later generations of the Anav family produced important scholars in the twelfth and thirteenth centuries. Nathan's nephew, Yehiel Anav, was a financial administrator for Pope Alexander III (r. 1159–1185). A scion of an eleventh-century convert to Christianity (Benedict, or Baruch, of Rome) became the popular antipope Anacletus II (Pietro Pier-leoni, r. 1130–1138); and Anacletus's family, the Pierleoni,

remained prominent in Roman politics and finances. Two earlier Pierleoni popes were Gregory VI and Gregory VII. Menahem ben Solomon produced an important homiletic commentary on Psalms in 1139 and concretized the liturgy of the so-called Roman or Italian prayer book. Many papal physicians through the Renaissance were Jews. By virtue of their presence at the papal court, the Jewish community of Rome—numbering about 1,000 and centered in Trastevere—provided an intercessionary voice for Jews of Roman Catholic and other Christian lands.

In the thirteenth century, the papacy became more aggressive, and Gregory I's ambivalent policy toward the Jews was sharpened. Innocent III, through the Fourth Lateran Council, imposed a yellow star on Jews (as well as on Muslims). The newly established Inquisition was invited by the Jews of Provence to consider whether the writings of the renowned philosopher and religious thinker Maimonides were blasphemous; the inquisitors went on to condemn the Talmud (the codified corpus of rabbinic commentary on the Bible), which would be periodically burned over the next few centuries. The recently established Dominican order began to study Jewish religious writings and, with the aid of apostates, engaged Jews in public disputations, especially in Spain. On the other hand, the popes vigorously, if ineffectually, condemned popular hysteria regarding Jews, trying to discredit accusations that the Jews practiced blood libels (stealing Christian children to use their blood for making unleavened bread at Passover), poisoned wells, and desecrated the host wafer (the eucharistic bread). Popes also challenged the Holy Roman emperors on the question of jurisdiction over the Jews. This controversy may be seen as part of the larger investiture controversy; it also had important economic ramifications, since jurisdiction involved taxation as well as protection. The Hohenstaufen emperors, for their part, redefined the Jews in their realm as *servi camerae* and placed Jews under the protection of the king's peace along with ecclesiastics and women.

Jewish life in southern Italy and Sicily received a mortal blow in 1290 with the forced conversion of its still Arabized communities. Presumably, the victims also included the colony of Jews whom Roger II had kidnapped from Corinth in 1172 and brought to Palermo to create a silk industry. This persecution ended the school of philosophers

and translators that had flourished during the twelfth and thirteenth centuries.

The center of Jewish life in Italy had shifted permanently to northern Italy by the end of the thirteenth century, although Italian Jewry would always have a voice in Rome. The developing economies of the northern cities attracted Jews whose value to the economy eventually overcame barriers against their settlement. Jews were banned by law from politics and were excluded from competitive manufacturing by the Christian guild system. Their public economy therefore developed in the area of essential services: medicine (prohibited by church canon), loans (challenged as usury by the church), general retail merchandising, and secondhand clothing. Indeed, most of the Jews were involved in the garment industry, which involved both domestic use and a minimal trade. The Jewish community was also served by its own ritual slaughterers, tanners, religious functionaries, teachers, and judges. Loan banks were the major source of income for the small percentage of wealthy Jews. Jewish pawnshops were a familiar institution in most Italian cities, welcomed by the mass of poor Christians who could not possibly afford the exorbitant rates charged by the Lombard banking houses. During the fourteenth century, Jews were periodically expelled, but popular demand always brought them back. Jews began to gain privileges, protection, and occasionally citizenship from the new city governments: in Urbino (beginning of the fourteenth century), Rome (1310), Naples (1311), Montefiascone (1312), Mantua (1386), Milan (1387), etc.

Because of their ubiquity, Jews were seen both positively and negatively in Italian culture, depending on the prejudice of the observer. One factor exacerbating the negative image was an influx of French, German, and Spanish Jews who had been persecuted in or expelled from their homelands. The immigrants established their own separate congregations and synagogues, but there was persistent tension regarding religious and communal matters. More positively, Jews participated in the development of local languages; an Italian translation of Hebrew poems is extant, as are Hebrew-Italian word lists. Apparently, the weekly reading of the Pentateuch in some synagogues was in Italian. Immanuel ben Solomon ha-Romi (c. 1270-c. 1330) composed poems in Italian and sonnets in Hebrew and produced a

Hebrew version (*Topbet ve-eden*) of Dante's *Inferno*. The tradition of religious and secular poetry continued to flourish, as did talmudic studies, especially in Rome, where great efforts resulted in a Hebrew translation of the nearly lost commentary to the Mishnah of Maimonides. Philosophers, too, were prominent among scholars. For example, Judah ben Moses, known as Judah Romano, was part of the circle of translators of King Robert of Naples, along with Kalonymos ben Kalonymos and Shemaryah Ikriti, an erstwhile Roman. There was fierce competition between pro-Maimonidean and anti-Maimonidean factions; this was to last for centuries and included the newly developing kab-balistic (mystical) trends emanating from Spain.

In the last generation of the fourteenth century saw a decline in Jewish scholarship. Plagued by natural disasters and economic difficulties and burdened with extraordinary taxes, the Italian communities of Rome, Bologna, Padua, and Ferrara founded a committee of collective relief in 1416. Italian Jewry, a composite of French, German, Spanish, and Italian congregations with a rich cultural background, was now organized to participate fully in the Renaissance.

Most of the scholarship on Italian Jewry is in either Italian or Hebrew (see *Encyclopedia Judaica*, 9, 1146). The works listed in the bibliography below are, however, limited to English publications and translations, with the exception of Milano (1954). *The Jewish Encyclopedia* (1901), *Universal Jewish Encyclopedia* (1939), and *Encyclopedia Judaica* (1971) are recommended for general and specific subjects.

Joachim of Fiore

Joachim of Fiore (Flora, Floris; c. 1135-30 March 1202) was a biblical exegete and the founder of the order of San Giovanni in Fiore, commonly known as the Florentians. Joachim's attempts to explain the patterns of Christian history gained him a reputation as a prophet in the thirteenth century, as well as a following among the Spiritual faction of the Franciscan order. His reputation as a prophet made his thought very influential in the later Middle Ages, but some people considered him a heretic because of his Trinitarian doctrine and his adoption by the Spirituals.

Joachim was born in Celico, near Cosenza in Calabria. As a young man, he trained to be a notary like his father, and for some years he served in this capacity at the Corte del Giustiziere in Calabria and later at the court of King William II of Sicily in Salerno. Around 1167, a serious illness led Joachim to make a pilgrimage to the Holy Land,

where he decided to become a monk. On his return to Calabria, Joachim retired first to the Cistercian monastery of Sambucina and then to the monastery of Corazzo, near Catanzaro. There he professed and was ordained in 1168. Sometime before 1177, he was elected abbot. Joachim found administration arduous; and when negotiations to have Corazzo officially accepted by the Cistercian order led to a two-year residence at the Cistercian monastery of Casamari (1182-1184), he took advantage of the respite to begin two major works of biblical exegesis. These were *Liber de concordia Novi ac Veteris Testamenti* (*Book on the Concordance between the Old and the New Testaments*) and *Expositio in Apocalypsim* (*Exposition of the Apocalypse*). Now convinced that exegesis was his real calling, Joachim turned to the papacy to obtain a release from administration. When Pope Lucius III took up residence in nearby Veroli during 1184, Joachim obtained Lucius's permission to devote himself to writing for a year and a half. He received a renewal of this permission from Pope Urban III in 1186, and another from Pope Clement III in 1188. Clement also seems to have approved Joachim's resignation as abbot of Corazzo, which was now fully incorporated into the Cistercian order.

In the mid-1180s, Joachim became dissatisfied with the Cistercian life. He moved to a hermitage at Petraiata, and then to San Giovanni in Fiore, in the Sila mountains. Meanwhile, his reputation as a prophet was growing. In 1191, he was summoned to an interview with Richard I Coeur de Lion (Lion-Heart) at Messina; later that year he was summoned to another, with Emperor Henry VI near Naples. The Cistercian leadership did not approve of Joachim's activities, however. In 1192, the order's chapter general declared that if Joachim and his companion Ranier of Ponza did not return to Corazzo by the feast of John the Baptist in 1193, they would be considered fugitives. Joachim ignored the deadline and instead founded his own order at Fiore. Again he turned to the papacy to legitimize his actions. The rule of Joachim's new order, based on that of the Cistercians but more austere, was approved by Pope Celestine III in 1196. Joachim also received a charter for his monastery and an annual stipend from Emperor Henry VI. The new order spread rapidly, establishing thirty-eight houses in Calabria and twenty-two elsewhere within the first few decades of its existence. But its growth stopped in the mid-thirteenth century, apparently

because of competition from the Mendicant orders. It was united with the Cistercian order in 1570.

Joachim died at the Florentine monastery of San Martino di Giove near Canaie. In 1240, his body was translated to San Giovanni, where it became the center of a local cult.

Joachim's fame rests on his novel method of scriptural exegesis. He sought understanding of what he called *concordia*—harmony between the Old Testament and the New Testament, manifested in parallel events. Joachim described this as "a similarity of equal proportion between the Old and the New Testaments, equal, I say, as to number, not as to dignity." The idea of *concordia* had no real precedent in earlier Christian exegesis. Typology had been used to argue that certain Old Testament events and figures foreshadowed Christ and that Christ was therefore the fulfillment of Old Testament prophecies, but Joachim's *concordia* presumed a steady parallel between Old Testament and Christian history. Moreover, Joachim treated Christ as one of many parallel figures and events in scriptural *concordia*, whereas previous exegetes had seen Christ as the only figure foreshadowed in the Old Testament. It has been suggested that Joachim's *concordia* derived from a desire, common in the twelfth century, to find meaning and pattern in human history. In this sense, Joachim's exegesis was very much in the spirit of his time.

Joachim believed that three visions had given him the spiritual insight to perceive scriptural *concordia*. His study of *concordia* revealed, in turn, the patterns of history. These were overlapping numerical sequences of events, arranged mainly in twos, threes, and sevens. The two most important were the synchronous *diffinitio alpha* and *diffinitio omega*. *Diffinitio alpha* divided history into three *status* or states, corresponding to the persons of the Trinity and symbolizing the spiritual progress of humanity. *Diffinitio omega* was arranged in two stages corresponding to the Old Testament on the one hand, and the New Testament, the Christian era, and a final period of special spiritual understanding on the other. This final period would be the completion of the Christian era. The first *status* of *diffinitio alpha* was marked by an order of married people and the second by an order of clerics; the third would be characterized by an order of monks. This third *status* would be a time of joyous contemplation and understanding of the

scriptures, in which the church would become truly spiritual. Joachim thought that the second *status* was gradually giving way to the third in his own time. On the basis of the pattern of twos that he saw throughout the Old and New Testaments, he predicted that the church would be led into the new *status* by two new orders of spiritual men: one an order of hermits, the other of preachers. These orders would not end the Roman church but would, rather, lead its transition to a higher quality of spiritual life. There would be a period of peace before the last great persecution preceding the last judgment.

Joachim subdivided the stages of historical *diffinitiones* into lesser overlapping patterns, also numerically based. For example, the first *status* featured twelve patriarchs who founded twelve tribes, the second had twelve apostles who founded twelve churches, and the third had twelve great religious who founded twelve monasteries. Although each set of twelve dominated its own *status*, it also had roots in the previous *status*, thus producing the overlap. By far the most important of these lesser sequences was a pattern of sevens arranging the Old and New Testament stages of history. There was some precedent for this among previous exegetes, who had often divided history into seven periods. But whereas traditional commentators such as Augustine envisioned the seventh period as a time of peace beyond the end of history, Joachim placed his seventh age before the last judgment. He considered this seventh age to be concomitant with the third *status*. Joachim was also original in imposing a pattern of concordant double sevens subdividing the seven ages: one a sequence of seven seals that appeared during the second and third ages, the other a sequence of seven openings of the seals that occurred in the sixth age. Joachim believed that he was living at the end of the sixth age and near the end of the fifth seal-opening, so he speculated a good deal on the identity of contemporaries who might figure in the transition to the next age. This established an important precedent for his followers.

Joachim's Trinitarian concerns led him to question Peter Lombard's commonly accepted description of the unity of the Trinity, *vera et propria*, suggesting instead *collectiva et similitudi-naria*. This formulation was condemned as tritheistic at the Fourth Lateran Council in 1215. The council's failure to comment on the rest of Joachim's doctrines created uncertainty about his orthodoxy, and this uncertainty

was never really resolved. While many were drawn to Joachim's vision of a coming spiritual age, others remained suspicious of his doctrine. In the mid-thirteenth century and the early fourteenth, Joachim's reputation suffered further blows. His predictions regarding the two orders of spiritual men who would herald the new *status* attracted the interest of the newly founded Dominicans and Franciscans. Soon radical Franciscans had woven their own apocalyptic notions around Joachim's thought. Gerard of Borgo San Donnino's *Eternal Evangel* was condemned as heretical in 1255. The doctrines of the Spiritual Franciscans met a similar fate in the 1310s. Both were deeply rooted in Joachim's teachings, and their censure increased doubts about his orthodoxy.

Joachim's double reputation as a prophet and a heretic continued into modern times. Thomas Aquinas, Duns Scotus, and the sixteenth-century historian Cesare Baronius all considered him heterodox; Dante, Boccaccio, and the usually skeptical Bol-landist Daniel Papebroch considered him a prophet. Early Protestant writers were similarly divided. During the Enlightenment, attacks on the notion of prophecy drastically diminished Joachim's influence, but in the nineteenth and twentieth centuries it could still be found in figures as diverse as Auguste Comte and Carl Jung.

Joanna I of Naples

Joanna (Joan, Joanne, Giovanna; 1326-1382, r. 1343-1382) was queen regnant of Naples. She was the elder daughter of Robert the Wise, king of Naples, and was married four times: to Andrew of Hungary (in 1340), Louis of Taranto (1347), James of Majorca (1362), and Otto of Brunswick (1375). She had no surviving issue.

In 1345, Andrew was assassinated. His death provoked an invasion by his brother, Louis the Great of Hungary, who accused Joanna of complicity in Andrew's murder and claimed the throne for himself (as the grandson of Charles Martel, firstborn son of Charles I of Anjou). Louis entered Naples in 1348. Few Italians opposed him, and some, including Cola di Rienzo, were actively supportive. (Cola, however, fell before the Hungarian triumph, his defeat having been partly engineered by Joanna's supporters.) Joanna, seeking allies, married one cousin, Louis of Taranto, secretly and without papal sanction (she and Louis were related closely enough to require a dispensation in order to marry); and appointed another cousin, Charles of Du-razzo (d. 1348), guardian of her son, though Charles played an equivocal role in the invasion. As the Hungarians approached, Joanna and Louis fled to their overlord, Pope Clement VI, at Avignon. To recover his support after their marriage and the murder of Andrew and to obtain money with which to renew the fight against Hungary, Joanna sold Avignon to Clement for 80,000 florins, considerably less than its worth. Meanwhile, the black death broke out, and the Hungarians, much reduced in number, returned home, taking as hostage Joanna's son (who died in Hungary) but leaving Joanna and Louis of Taranto in possession of the Regno. The Hungarians returned later, but never successfully. By 1352, Louis of Taranto, with help from the papacy, was recognized in Naples and had also established his rights against his wife's claims to sovereignty. Organized by the grand seneschal, Niccoló Acciaiuoli, the Regno experienced a brief period of recovery before war was renewed. The war was undertaken again partly in an unsuccessful attempt to

reunite Sicily (which had been under Aragonese rule since 1285) with the Regno, and partly because of renewed rebellion by the Durazzo branch of the Angevins, who resented the dominance of Louis of Taranto.

Louis died in 1362. Joanna's third husband, James of Majorca, was given no authority in government. James—who had recently escaped from fourteen years' imprisonment in an iron cage by his uncle, Peter IV of Aragon—was half mad and periodically violent. He soon returned to Spain, and from 1362 to 1375 Joanna ruled alone. Despite minor rebellions initiated by her sister Maria, who was the widow of Charles of Durazzo, and by Maria's sons, the realm achieved a measure of peace. In 1368-1370, Urban V briefly returned to Italy from Avignon, with Joanna's protection.

In 1378, Urban VI, formerly archbishop of Bari and Joanna's subject, became pope and quickly indicated his intention to revive and support the Hungarian claim to Naples. Accordingly, when a rival pope, Clement VII, was elected, Joanna took Clement's part; and her next husband, Otto of Brunswick, proved entirely willing to persecute Urban's followers. Urban reacted by excommunicating Joanna and conceding her throne to Louis of Hungary. Charles III of Durazzo (nephew of Maria and the late elder Charles) encouraged Louis, so, although Charles III was her nearest relative, Joanna excluded him from the succession. Instead, with Clement VII's approval, she bequeathed all her rights to Louis of Anjou, eldest brother of Charles V of France (in January 1380). In 1381, Urban, despairing of the Hungarians, crowned Charles III of Durazzo king of Naples. In the ensuing civil war, Charles was successful: in August Otto was taken prisoner and Joanna surrendered. She died in prison, probably stifled to death on Charles's orders, in July 1382, while her adopted heir, Louis of Anjou, was coming over the Alps to her rescue.

Joanna's lament "I regret only one thing, that the Almighty did not make me a man" has some justification. Urban VI's main complaint against her was apparently that he disliked queens regnant. She had some devotees, notably Giovanni Boc-caccio, but she was more usually scorned as immoral and incompetent. Still, she did her best work when she ruled alone: although her reign was a disaster, the problems were not all of her making.

Johannes Andreae

Johannes Andreae (d. 1348) was the one layman among the great canonists of the Middle Ages. He studied in Bologna with Guido de Baysio, the archdeacon, receiving his doctorate c. 1298. Pope Boniface VIII issued the decretal collection *Liber sextus decretalium* in 1298, and about three years later Johannes composed the ordinary gloss to it. Johannes taught most often at the University of Bologna, and he achieved prominence in the affairs of that city. Shortly after 1317, when Pope John XXII reissued the *Constitutiones clementinae* (*Clementines*) of his predecessor, Clement V, Johannes composed a commentary on that collection; this commentary, too, achieved the status of an ordinary gloss, found with most copies of the compilation. Johannes also composed a *Novella*, or new commentary, on the *Decretals* of Gregory IX. Late in life, he published a *Novella* on *Liber sextus*, supplementing his earlier gloss; and he left notes for an update of his commentary on the *Clementines*. When he died of the plague, Johannes also left behind numerous opinions, disputations, and procedural works, as well as later commentaries on decretal collections, especially *Liber sextus* and the *Clementines*, merely adding to his work. The tale that he had a beautiful daughter, Novella, who lectured in his absence, is doubted by scholars.

John VIII, Pope

Pope John VIII (d. 16 December 882, r. 872-882) was chosen following the death of Pope Hadrian II. John had long been a member of the Roman clergy and was an adviser to Pope Nicholas I. As pope, John struggled to maintain the integrity of the papacy through a period of mounting turbulence. His immediate problems were military, diplomatic, and ecclesiastical. Saracen raids had become a growing menace to many areas of Italy, compelling him to build fortifications around Roman churches outside the walls. More broadly, he cultivated the Carolingian rulers Louis II and Charles the Bald in hope of securing their military aid. This brought him into complicated controversies with rival Carolingian princes that did not end until John's coronation of Charles the Fat as emperor (881); and in any event military support from the Franks did not prove forthcoming.

Hoping to obtain support instead from Byzantium, John sought to resolve a long dispute between Rome and Constantinople over the controversial patriarchate of Photius. John was willing to concede recognition of the restoration of Photius by the new emperor, Basil I, but the outcome was complicated by the issue of ecclesiastical jurisdiction over Bulgaria, a Slavic kingdom. Bulgaria had turned from Constantinople to Rome in order to receive Christianization, and Bishop Formosus, a bitter rival of Pope John, had successfully pursued papal missionary work there. Then, disillusioned in turn with their Roman connections, the Bulgarians suddenly turned back to Constantinople. In 879, there was a meeting of the council in Constantinople; John had sent legates, but behind their backs the patriarch and the emperor maneuvered to secure the adherence of the Bulgarian church to the east. John was foiled not only in this matter but also over certain fine points; however, he accepted these defeats with the consolation of renewed good relations between the great sees, as well as some military help from the Byzantines in Italy. At the same time, John was concerned about the independence of the German clergy in central Europe; to restrain them, he continued Nicholas I's policy of supporting the work of the Byzantine missionary Methodius in Moravia against them.

Faced with increasing violence in Rome and with the dissidence of his political opponents, John was betrayed by his retinue, who first tried to poison him and then beat him to death.

John X, Pope

Pope John X (d. 929, r. 914-928) had been archbishop of Ravenna and was chosen as pope in early 914 with the backing of the clan of Theophylact. In the summer of 915, John led a Christian coalition to the battle of the Garigliano, where he fought with distinction. This success sealed John's alliance with Theophylact's faction in Rome. Not until after 924, when his Roman protectors and Berengar (whom John had crowned emperor in 915) were dead, did John's position in Rome weaken. The pope desperately sought new allies but lost favor in Rome; he was deposed by Marozia in June 928. John was imprisoned and died mysteriously in 929.

John realistically tolerated the Roman dynasts' influence on the papacy but also held to an exalted concept of the popes' role in Christendom. He intervened in the affairs of numerous European and eastern churches and worked to incorporate the Dalmatian and

Croatian churches in Latin Christendom. He idealized the empire as an antidote to the Roman factions and gave imperial leaders considerable authority in ecclesiastical matters. John's contemporaries, and later writers, maligned him for moral faults and for his Roman politics.

John's letters as archbishop are in Loewenfeld (1883); his papal letters are in Migne (1880) and *Regesta Pontificum Romanorum* (1885). Councils held during his pontificate are recorded in Mansi (1778).

John XII, Pope

Pope John XII (Octavian; c. 937-964, r. 955–964) was the son of Alberic, a petty Roman warlord. Alberic's larger ambitions were curbed by Hugh of Provence, but Hugh was unable to dislodge Alberic from Rome. Alberic had his adolescent son, Octavian, elected pope in 955.

As pope, John was menaced by Berengar of Ivrea, who had driven Hugh of Provence from Italy. Repeating the actions of earlier popes, John called on a powerful northern ruler, Otto I, who was married to Adelaide, the widow of Hugh's son Lothar. Otto was looking for an excuse to invade Italy and did so in 961, posing as the pope's champion. John, in gratitude, crowned Otto emperor in February 962. The pope soon regretted his action and plotted against Otto, possibly asking the Magyars and the Byzantines for aid. Otto in turn deposed John and chose another pope, Leo VIII. John was driven from Rome but recaptured the city when Otto left. However, John died soon thereafter, evidently from a beating by an outraged husband whose wife had been caught with the pope. John XII, a dissolute and incompetent youth who was said to have toasted the devil's health when drunk, was probably the worst pope in history.

John XII's surviving official documents (and at least one forgery) are collected in *Regesta Imperii* (Zimmermann 1998).

John XXI, Pope

Pope John XXI (Petrus Juliani, Petrus Hispanus, Peter of Spain; d. 1277, r. 1276-1277) was Portuguese. He studied in Paris, receiving his degree in the arts c. 1240. After teaching medicine in Siena c. 1246-1250, he became dean of Lisbon and an archdeacon. Pope Gregory X made Peter his physician. Peter became a cardinal in 1273 and took part in the Second Council of Lyon in 1274. Following Hadrian V's brief pontificate, Peter was elected pope in Viterbo, in riotous circumstances. Although (owing to a scribal error) there had been no John XX, uncertainty about the correct numeration of the popes led to his being cal led John XXI.

John was a scholar, not a politician, and he left many decisions to Cardinal Giovanni Gaetano Orsini, Charles of Anjou lost favor; and negotiations were resumed with the Greeks, in part to thwart the Angevins' ambitions in the east. Rudolf I of Hapsburg was favored to

become emperor, and negotiations for peace between France and Castile were undertaken. Papal authorization for the bishop of Paris to inquire into the teachings at the university there led to condemnations of certain errors.

John XXI died when the roof of his study in the papal palace at Viterbo collapsed. Orsini succeeded him as Nicholas III, further undermining the Angevins' ambitions. John is best-known for a tract on logic, *Summulae logicales*; and for a medical compendium, *Thesaurus pauperum*.

John XXII, Pope

Pope John XXII (Jacques Duèse,, d'Euse, Deuze; c. 1245-1334, r. 7 August 1316-4 December 1334) was born at Cahors to a prominent bourgeois family. He studied law at Orléans and Paris, and subsequently taught canon and civil law at Cahors and Orleans. Elected bishop of Fréjus in 1300, he became the chancellor of Charles II of Anjou, king of Naples, in 1308. Pope Clement V made him bishop of Avignon two years later and a cardinal in 1312.

On his election as the second Avignonese pope, John considered a plan to return the papacy to Italy from Avignon; when that proved impractical, he took steps to establish Avignon as a long-term residence for the papal curia. John initiated a number of ecclesiastical reforms, the most important of which were fiscal and administrative. Many were

intended to replace revenues that the papacy had lost when it withdrew from Italy. These measures—especially John's extension of papal authority to grant and tax benefices—were extremely effective, but they created much ill feeling toward the papacy among local clergy. John also founded the papal library at Avignon; promoted important missionary activity in Asia; established a university at Cahors; and promulgated *Extravagantes communes* and *Constitutiones Clementinae*, collections of his own decretals and those of his predecessor.

John's reign was marked by several important conflicts. His opposition to attempts by the German emperor Louis IV to assert imperial rights in Italy led to a long struggle. In 1324, Louis was excommunicated; in 1328, he invaded Italy and installed an antipope at Rome. Although the antipope submitted to John in 1330, Louis remained an enemy of the Avignon papacy until his death in 1347. During the 1320s, John's efforts to resolve disputes within the Franciscan order over the nature of apostolic poverty led to a clash with the order's leadership. By the end of the decade the Franciscan minister-general and other prominent Franciscans had defected to the court of Louis IV.

John's obstinate, contentious nature is often blamed for the severity of these disputes. In 1331, he created a controversy single-handedly when he insisted on proposing for public discussion among theologians a personal and highly problematic theory regarding the beatific vision. Despite accusations of heresy from his political opponents and despite the overwhelmingly negative appraisals of his interpretation by consulting theologians, John asserted until he was on his deathbed his right to hold the doctrine as a personal opinion. The episode did considerable damage to his own reputation and to that of the Avignon papacy.

Jordanes, Chronicler

The chronicler Jordanes (Jornandes, sixth century) was of Gothic origin. He is first attested to as a notary (secretary) in the service of an Ostrogothic general named Gunthigis *qui et* Baza in the early sixth century. Jordanes eventually converted from Arianism to Catholicism and seems to have become a cleric. Some historians identify him with a contemporary bishop, Jordanes of Croton.

Around 550, Jordanes composed *On the Origin and History of the Goths*, usually called the *Getica*, which summarized the now lost *Gothic History* written by the Roman senator Cassiodorus. He also wrote *A Survey of the Times, or, On the Origin and History of the Roman People*, usually referred to as the *Romana*. This work is in two parts: the first part covers the history of the world up to the beginning of the Roman empire, and the second covers the Roman empire. The *Romana* was

partially based on another lost history, that of the Roman senator Aurelius Memmius Symmachus, although not nearly to the extent once thought. The suggestion has been made that Jordanes's works, which are both in Latin, were written in Constantinople.

Jordanes gives the earliest extant account of barbarian history written from the barbarians' viewpoint, and his works include much material that is found nowhere else. His underlying intention was to justify the Gothic domination over the Romans.

Jovinian

The medieval church is known for its emphasis on monasticism and asceticism, but in the fourth century that emphasis was still a subject of dispute. The opinion which was to prevail became solidified in Italy in part during a controversy generated by Jovinian (d. before 406). Jovinian was a monk and ascetic who practiced celibacy, chastity, and bodily mortification. However, he came to the conclusion that such actions were irrelevant to true Christian belief, and so he abandoned his

asceticism for a moderate life and wrote pamphlets encouraging other Christians to do the same.

None of Jovinian's writings survive; we know his position only from his opponents, primarily Jerome, Ambrose, Pope Siricius, and Augustine. From their works, it appears that Jovinian advocated the following positions: (1) There is no difference between baptized Christians who are married or chaste, and there will be no differential reward in heaven. (2) There is no advantage to fasting. (3) Mary conceived Jesus as a virgin but lost her virginity bearing him. These points directly contradicted the position of the powerful ascetic party (represented by Ambrose, Jerome, and other influential Romans), but they were popular with many people. According to Pope Siricius, under Jovinian's influence numerous dedicated virgins abandoned their vows in order to marry, and numerous ascetics abandoned their rigors for a more balanced life.

Jovinian and his ideas were condemned at a Roman synod presided over by Pope Siricius in 389 or 392. A year later, the condemnation was repeated at a synod in Milan guided by Ambrose. The medieval church rejected the moderate position advocated by Jovinian, but the questions he raised regarding the value of virginity and the nature of a Christian life did not disappear.

Jubilee

The first year of jubilee, or Holy Year, was officially proclaimed by Pope Boniface VIII on 22 February 1300 by means of the bull *Antiquorum habet*. Who may lay claim to the decisive initiative for the proclamation is a question that cannot be answered unequivocally. There is no question, however, that at the beginning of the year 1300 the streams of the faithful flowing into Rome had quite unusual expectations about obtaining indulgences and that these expectations were associated with the special character of the year as marking the beginning of a new century. Boniface VIII responded to the expectancy of the masses, but his own positive disposition stemmed from a variety of motives. Alongside the pastoral care of souls, power politics was certainly significant: the superior position of the successor to the prince of the apostles should have made clear to all—especially to temporal rulers of the stripe of a Philip the Fair of France—that expectations at the turn of the century were being used to enhance the pope's political power. Moreover, economic considerations were favorable for the

inauguration of the jubilee year.

Before the final proclamation, however, it had to be determined what kind of indulgence was to be attached to the Holy Year. Boniface VIII had the archives searched for precedents and had eyewitness accounts of the Holy Year 1200 examined; he finally followed the example of the indulgence for a crusade, which almost always took the form of an *indulgentia plenaria*, i.e., a plenary indulgence for the guilt and the punishment for sins. This was the most significant of all indulgences; and to prevent anyone from obtaining it more than once in a lifetime, there was a legally binding condition calling for a lapse of 100 years between two jubilees. Boniface granted a full indulgence of all sins, and of the punishment resulting from them, to all foreign pilgrims who, after receiving the sacrament of penance in full penitence of spirit, visited for fifteen days both the basilica of Saint Peter and the basilica of Saint Paul Outside the Walls. For Romans, the fifteen days were increased to thirty. These requirements were strictly maintained. In only three cases did Boniface suspend the canonically specified length of the visitation.

As expected, the city of Rome profited enormously from the rush of faithful visitors. The Florentine chronicler Giovanni Villani says that 200,000 pilgrims were constantly present in Rome. Villani was probably exaggerating; and Cardinal Stefaneschi—in the only contemporary treatise, *De centesimo seu iubileo anno*—laments the absence of princes, who would have brought increased contributions of money. Even so, the Holy Year 1300 can certainly be numbered among the largest celebrations for the masses in medieval Christianity.

Appealing to Leviticus 25, which describes a kind of Jewish holy year celebrated every fifty years, Pope Clement VII proclaimed on 7 January 1343, in his bull *Unigenitus Dei filius*, a new Holy Year for 1350. Clement thus halved the interval between two Holy Years and gave more people the opportunity of obtaining a plenary indulgence. He also added Saint John Lateran to the basilicas that had to be visited. Along with the main bull, *Unigenitus*, there circulated two unpromulgated bulls. One of these bulls required a daily visit to five churches—Saint Mary Major and Saint Lawrence Outside the Walls were added—and allowed all religious, if they received the permission of the head of their order, to set out for Rome. The second bull (*Ad memoriam reducendo*)

was an astonishing proclamation: it reduced penitential action to a visit to only one church; and religious—expressly including women—could make the journey to Rome without permission from the head of their order. It is not clear how widely this latter bull was followed. Clement allowed many kinds of exceptions: Elisabeth of Hungary and the English royal family received the privilege of indulgence without the pilgrimage to Rome—in return, of course, for payment of a sum equivalent to the expected cost of the trip. For the first time, a whole populace profited from the indulgence: Majorca obtained the privilege of indulgence in return for the payment of 30,000 florins. In addition, the cardinal legates present in Rome were fully empowered—in case of epidemics or shortages of provisions—to adjust the length of the pilgrims' visit.

The next Holy Year reflected the church's uncertain political situation at the time of the Great Schism. The Holy Year of 1390 was an expression of the financial distress of the Roman pope Boniface IX, whose administration was intensely aware of the expected increase in revenues. Urban VI had already shortened the interval between two jubilees to thirty-three years, the length of Jesus' life. Yet in 1400, a Holy Year was celebrated that was never officially proclaimed. There is no doubt that the Holy Year had been reduced to its political and economic aspects and served as an ideological battleground for the competing popes. But Rome profited once more from the inflationary increase in Holy Years: Boniface IX instituted a church construction program, ensuring the stability of many churches and contributing not a little to the beautification of the distressed and physically neglected city.

The Holy Year of 1423 under Martin V is the least documented. It too was never officially proclaimed, because it ran counter to the regulations of the Council of Constance prescribing a Holy Year for 1450; and not until 1450 was Nicholas V able to celebrate an official Holy Year in proper form and before a suitable public. In 1468 the interval between two jubilees was reduced to twenty-five years. Other cities also offered competing Holy Years: Montmajour and Saint Jean c. 1400, Canterbury c. 1420, and Santiago de Compostella c. 1426. The Reformation, however, brought to an end all Holy Years except those in Rome and Santiago.

Justinian I

Justinian I (Flavius Sabbatius; c. 482 or 483-565, r. 527-565) was the sovereign of the eastern Roman, or Byzantine, empire during an age of vast transition and was a figure of both glory and paradox. Born a peasant, he appreciated the awesome Roman heritage as few others could appreciate it; but in seeking to be its steward and restorer, he also opened the way to its transformation. His reign—one of the longest in the Byzantine empire—saw achievements that were substantial and enduring but brought ruin and disaster as their price. In his very quest to restore the territorial and doctrinal unity of the Roman world, Justinian guaranteed its further fragmentation.

Justinian was of Thracian-Illyrian stock and was born in a Latin-speaking district of the Macedonian Balkans. His uncle, Justin, having achieved success as a member of the new imperial guards in Constantinople, sent for the boy and several other nephews in order to give them an education, and opportunities, in the capital. Adopting a new name in tribute to his uncle, Justinian learned Greek, took a liking to intellectual pursuits such as theology, and learned the workings of the militia and the court. In 518, by a quirk of fortune, Justin seized the throne, and Justinian quickly emerged as his right-hand man, becoming heir-designate in 525 and full successor two years later.

By that time, Justinian had met and married Theodora, the remarkable woman who was to be his invaluable partner in rule. He had also identified administrators and commanders on whom he could

rely and had formulated the main lines of his policies. During the first four years of his reign, he was trapped in an unwanted war with his powerful eastern neighbor, Persia; and just as he was winning peace and freedom there, the devastating Nika riots of January 532 nearly swept him off the throne. He recovered quickly, however, thanks partly to the advice of Theodora and to the soldiers of the young general Belisarius, and was then in a stronger position that allowed him to initiate an array of projects. These included a codification of the Roman legal tradition as *Corpus juris civilis*, schemes to end the religious and political dissent of the Monophysites and other heterodox movements, and a large-scale building program that was to culminate in the triumphant cathedral of Hagia Sophia in the capital.

Justinian's chief project, though, was his program of reconquest, aimed at recovering the western provinces that had been detached by various Germanic tribes during the previous century. He was inspired in this by his duty to rescue the orthodox provincials in those districts from their Arian Christian rulers, and he was also prodded by dispossessed landowners who sought the restitution of their property; more broadly, he was motivated by his broad perception that the barbarian "successor states" in the west were only a temporary aberration, and by a sense that he was responsible for restoring the Roman empire to its former scope, encompassing the entire Mediterranean.

Exploiting diplomatic opportunities, Justinian dispatched the brilliant Belisarius to North Africa, where the destruction of the Vandal kingdom was effected with lightning speed (533–534). Meanwhile, given the deterioration of relations with the Ostro-goths in Italy during the last years of their king, Theoderic, and the dynastic crisis attending the succession of Theoderic's daughter Amalasuntha, Justinian was next able to address the conquest of the Ostrogoth kingdom. While another general was sent to seize the Ostrogoths' holdings in the Balkans, Belisarius landed in Sicily in the summer of 535, beginning the long episode of the Gothic wars in Italy.

Uneasy about Belisarius's popularity and military prowess, Justinian vacillated in his support for his general and was then furious when Belisarius dared to entertain an offer from the Goths to take the imperial title in the west. When the settlement of 540 with the Goths

broke down and a counter-offensive by Totila began undoing Belisarius's work, Justinian sent Belisarius back to Italy, though grudgingly and without adequate support or resources. Only when Belisarius asked to be recalled and the outlook in Italy seemed hopeless did Justinian commission Narses to organize a new army and complete the conquest of Italy.

Court of Justinian. Early Christian mosaic (500-525). San Vitale, Ravenna.
Photo: © Scala/Art Resource, N.Y.

When Justinian's commitment to the reconquest was most intense and the reconquest itself was in full tide and was proving more prolonged than he had intended, the rapacious Persian king reopened war with the empire on a wide range of fronts. This drained the emperor's manpower and resources, which were further reduced by a plague that ravaged the Mediterranean world in 542-543. Justinian, increasingly pressed, was forced to impose oppressive taxes and to skimp on expenditures wherever he could. His economies and his withdrawals of troops particularly weakened the Balkan regions, which were exposed to raids by various peoples, notably the Huns, who menaced Constantinople several times. This weakening allowed even more disastrous penetrations of the Balkans by Avars and Slavs in the

decades following Justinian's death.

Throughout his reign, Justinian strove to achieve religious unity in the face of intractable dissent and regional resistance. His continually shifting responses included persecution, conciliation, schemes for compromise, and the bullying of Pope Vigilius to win the accord of Rome. Justinian's increasing obsession with religious coercion poisoned his last years, during which the ruinous effects of his overstrained finances darkened his reputation and made his death in November 565 a relief to his subjects.

Among Justinian's achievements, for good or ill, must be reckoned his lasting impact on Italy. Although his wars of reconquest left the peninsula devastated and exhausted, he nevertheless set the pattern for its restored government through his Pragmatic Sanction of 554; and the extraordinarily comprehensive powers that he granted to Belisarius and Narses laid the foundation for the governmental agency of the exarchate, through which the Byzantine empire was to rule its Italian holdings in the face of invasions by the Lombards. The exarchs' capital, Ravenna, provided a model for imperial style and imagery for centuries and had an important influence on Charlemagne. This model was conveyed most notably through the wondrous mosaic decorations carried out under Justinian, which include the famous portraits of him and Theodora in San Vitale. As the sponsor of the great *Corpus juris civilis*—whose rediscovery in Italy in the eleventh century was influential in reviving Roman law and legal studies in later medieval Italy and the west in general—Justinian himself became a symbol of the traditions of Roman sovereignty. Dante was to celebrate Justinian as a paradigm of imperial majesty in Canto 6 of *Paradiso*.

Juvenal

Little is known about the life of Decimus Junius Juvenal (c. 50 or 60-c. 127). He was probably born in southern Latium, and he evidently received a good education in rhetoric. He wrote the *Satires*, sixteen poems in hexameters, between 100 and 127; and it is likely that he practiced law at the same time. Juvenal died sometime after 127.

The *Satires* object to various aspects of Roman society, from the ostentation of the nouveaux riches to the hypocrisy of false philosophers. The best-known and most virtuosic of the *Satires* is the

sixth, a scathing denunciation of the social and sexual habits of Roman women, aimed at dissuading a friend from marriage. This sixth *Satire*, like the collection as a whole, is pervaded by both indignation and nostalgia, Juvenal longs for an idealized version of the past, when propriety and moderation, rather than vice and corruption, prevailed.

Juvenal, *Satyra prima*. Venice: Aldus, 1501. Reproduced by courtesy of Department of Special Collections, General Library System, University of Wisconsin-Madison.

Although Juvenal's work was generally neglected in the centuries

following his death, he was cited more than seventy times by Servius (in the fourth century) and became a popular school author, Juvenal's disapprobation of the degeneracy of Roman society earned the admiration of early Christians, and his reputation as a moralist ensured his popularity in the Middle Ages. Juvenal's pithy style allowed his work to be excerpted and anthologized, and his poems served as important models for twelfth century Latin satire.

Dante cites Juvenal twice in *Convivio* and once in *Monarchic*, and in *Purgatorio* 22, Juvenal is represented as a character who, when he dies, brings news of Statius's veneration for Virgil to Limbo. However, Dante's knowledge of Juvenal's work was probably only at second hand. Boccaccio, though, was strongly influenced by Juvenal; his *Corbaccio* owes much of its misogynist vitriol to Juvenal's sixth *Satire*. Petrarch, too, seems to have been familiar with the *Satires* and made frequent reference to Juvenal, often identifying him as "the satirist."

Lactantius

Lactantius (Lucius Caelius Firmianus, c. 250-c. 325), a Christian apologist and rhetorician, is best known for *The Divine Institutes*, one of the earliest Latin attempts at systematic theology. Although he was considered a heretic by some during the Middle Ages, his prose style was admired by Renaissance humanists, who considered him a "Christian Cicero."

Lactantius was born in Roman Africa and studied there under Arnobius. A pagan by birth, he eventually converted to Christianity, although the date of his conversion is not known. The emperor Diocletian brought Lactantius to Nicomedia to teach rhetoric, but the advent of the Diocletian persecution in 303 effectively forced him to retire from teaching, and he left Nicomedia in 305 or 306. Around 317, the emperor Constantine I appointed Lactantius tutor to his eldest son, Crispus, and Lactantius took up residence at the imperial court in Trier. The date of Lactantius's death is unknown.

Lactantius's major surviving works were all written between 303 and 315. In *The Workmanship of God* (303–304), the nature of the human body is used to demonstrate divine providence. *The Divine Institutes* (304–311), Lactantius's masterwork, is an attack on paganism and a defense of Christianity. It is noteworthy for its attempt to place Christianity in a context that would have been familiar to Lactantius's contemporaries through the use of Cicero, Virgil, Seneca, and other pagan authors. *The Wrath of God* (313–314) argues that anger and kindness are necessary parts of God's nature. In *The Deaths of the Persecutors* (314–315), Lactantius interprets the eventual fate of those who persecuted Christians as evidence of God's righteous vengeance. Lactantius also prepared an *Epitome of the Divine Institutes* (c. 320) and wrote an allegorical poem, *The Phoenix* (date uncertain). His letters and a number of early works have been lost.

Lais in Italy

Lais became a particularly popular genre at the end of the twelfth century (1160-1170), with a collection of *lais* in octosyllabic couplets (Guigemar, Fresne, Bisclavret, Lanval, Deus Amanz, Yonec, Laiistic, Milun, Cbaitivel, Chievrefoil, Eliduc) by the Anglo-Norman poet Marie

de France, who was also the author of 102 fables and of *Espurgatoire Saint Patriz*, which was translated from Latin.

The *lai* belongs to the tradition of the *matière de Bretagne*, and judging from what Marie de France says in the prologue (verse 41) to her collection, the word *lai* (*Laid* in Old Irish) refers to a melody for which she had written verses. The word covers narrative (in the case of Marie de France) as well as lyric compositions, which can be divided into three main types: the *lai-descort*, *grand lai*, and Arthurian *lai*.

Marie de France's collection is the first important medieval work written and signed by a woman. Throughout the twelfth and thirteenth centuries, numerous anonymous *lais* were also produced—*Melion*, *Doon*, *Désiré*, *Graelent*, and *Guingamor*—all of which shared the theme of secret love between a knight and a fairy creature. Another group of *lais*—*Tydorel*, *Tyolet*, *Espine*—shared the theme of an encounter with a supernatural knight. Less closely related to the *matière de Bretagne* are the *lais* produced during the thirteenth century, which all appear to be characterized by love stories: *Lai de l'ombre*, by Jean Renart; *Lai d'Aristate*, by Henri d'Andeli; *Lai de l'oiseleP*, *Lai d'amours*; *Lai de l'èspervier*, and *Lai du conseil*.

The original Old French word *lai* occurs in several Italian medieval texts and is translated as "sonnet"—for instance, in *Tristano veneto* and, during the fourteenth century, in *La Tavola Ritonda o l'istoria di Tristano*. However, it is also rendered as "song" and "lamentation" (*Tristano veneto*; *Tristano riccardiano*; Dante, *Inferno*, 5.46; Dante, *Purgatorio*, 9.13), without the meaning of poetry set to music. However, *lai* is generally given with the meaning "lamentation," and only in *Meliadus* does the word keep its original meaning.

Traces of various narrative mm have been found in the *Decameron*: *Laüstic* in 5.4; *Yonec* in 4.2; and *Fresne* in 10.10. Finally, *Decameron* 4.9 is reminiscent of *Lai of Eliduc* and *Lai of the Ignauré*, also known as *Lai du prisonnier*. Traces of certain *lais* have also been found in Italian *cantari*. Levi (1914) noted parallels between the *Lai of Fresne* and the *cantare Gibello*. The theme of secret love between a knight and a fairy creature, found in *Lai of Lanval*, appears in three Italian *cantari* of the fourteenth and fifteenth centuries: *Bel Gherardino*, *Ponzela Gaia*, and *Liombruno*.

In spite of recent contributions, Neri's observation (in 1946) that the

impact of Marie de France's *Lais* on Italian literature was still largely unexplored still holds true and can be extended to the genre in general.

Lambert, Emperor

Lambert (d. 899) succeeded his father, Guy of Spoleto, as king of Italy and emperor in a challenge to Berengar I in 894. He had been associated with Guy since Guy's own imperial coronation in 891. Lambert's reign was brief (894-899) and troubled. He was young at his accession and depended on the support of his mother, Ageltrude, a daughter of Adelchis, the prince of Benevento. The intent of his rule was serious, as is indicated by a diet held at Ravenna, where he issued a series of laws aimed at protecting the church and curbing the pretensions of overly mighty subjects. His legislation was the last issued by the kings of Italy before Otto I. Lambert died, without heirs, in a hunting accident in 899.

Lancelot

Lancelot was one of the most famous and morally upstanding members of King Arthur's court at Camelot. The legends of his feats and of his love for Queen Guinevere were made famous in the twelfth century by French poets, most notably by Chrétien de Troyes in his *Chevalier de la charette*. Although Lancelot's adulterous love for King Arthur's wife made him unable to secure possession of the Holy Grail, Lancelot provided the medieval imagination with an enduring model of chivalrous behavior. Unlike the legend of Tristan and Isolde, which is

somewhat more erotic, that of Lancelot is characterized by nobility of character and constancy of affection. From the many allusions in learned as well as popular culture (such as the *cantari*) to episodes of the Arthurian cycle involving Lancelot, we may assume that his story was well known and much appreciated.

Reflections of the idealized figure of Lancelot appear early in Italian literature. There are about a dozen extant Italian translations of the Old French *Lancelot* dating from the thirteenth and fourteenth centuries, and Lancelot also appears in *Tristano Ricciardiano* (c. 1272-1300) and the famous *Tuvalu ritonda* (c. 1325-1350). In the anonymous *Novellino*, three short tales exalt Lancelot's reputation as a knight (28 and 45) and a faithful lover (82). He was celebrated in the courtly poetry of the thirteenth century by Guittone d'Arezzo (*Ben aggia ormai la fede e l'amor meo*), Folgore da San Gimignano (*Alia brigata nobile e cortese*), Brunetto Latini (*Tesoretto*, verse 40), and the anonymous author of *Mare amoroso* (verse 33). Lancelot's immutable devotion to Guinevere was easily assimilated into the poetic patterns of the nascent *dolce stil nuovo*, which made great use of similes and metaphors that depended on the readers' familiarity with Lancelot's adventures and character.

The most famous literary use of Lancelot in the Italian Middle Ages is, of course, Dante's. In the celebrated fifth canto of *Inferno*, Francesca recounts her reading of "Gallehault," the section of *Lancelot du lac* in which Lancelot and Guinevere exchange their first kiss (verses 127-137). The earliest commentators on the *Comedy* saw in this episode a moral condemnation of the Arthurian romances; it is certain that by the end of the fourteenth century, Dante's epic poem was considered a more lofty literary subject than Lancelot's adventures (see Sacchetti's *Trecentonovelle*, 114). In Dante's *Convivio* (4.28.7-8), Lancelot is evoked not for his chivalry or fidelity, but for his religious conversion.

Land Tenure and Inheritance

A simple fact explains why tenurial practices in medieval Italy were so complex: land was essential to the existence of everyone, of whatever status. Men who controlled much land had power over those who controlled little or no land, the powerless. But "control" and "ownership" took many forms—individual, communal, institutional, kin-based, feudal—and all these levels could operate around one land parcel at one moment. It is no wonder that historians find tenure an awkward though fascinating matter.

Most medieval documents have not preserved much information about customary practices concerning land tenure; as a result, many texts may describe untypical situations. Most information appears in legal codes and charters, but both pose problems. In the laws of all periods, most passages discussing tenure refer to unusual and awkward tenurial situations, such as those caused by family disputes, widowhood, and entry into the church—particular cases that had been presented to the ruler or rulers for a decision. Such laws were not necessarily relevant to the way property rights functioned and developed in the wider world. Furthermore, there is little evidence that sophisticated late Roman distinctions between types of ownership, expressed in an almost obsessive desire to define terms, survived in

medieval property law before the twelfth century. The late Roman *potestas* and *dominium* occur in medieval laws and charters only as vague terms for "power" rather than as precise sorts of tenure, and it is likely that the late Roman distinction between "the right and the fact of control over a thing" (Levy 1951) was blurred because medieval state mechanisms for enforcing such niceties were not very effective. Romans soon learned that the technicalities of ownership often mattered little in the face of "barbarian" force.

The hundreds of thousands of charters surviving from medieval Italy seem to convey more "real" information than the laws because these charters represent the principal documentary form in which rights of tenure were written down. They include records of gifts, bequests, sales, and purchases, but also contracts of rent and render. Because the charters were most concerned with recording transmission of tenure, rather than defining that tenure precisely, it is not always clear from them what the terms of the tenure were. Even so, they provide the best chance of understanding land tenure.

The gap between the laws and the charters is sometimes usefully bridged by records of court proceedings, known as *placita*, involving instances of disputed land tenure. These reveal that tenurial rights seemingly fixed by laws or in charters could be challenged successfully in court, with reference to the testimony of local witnesses concerning customary practice. However, from the ninth century on, effective possession of a plot of land or a landed estate came increasingly to be associated with possession of a valid charter record concerning the transmission of the property to the current holder. To make the transaction legally valid, the alienator had to be the owner of the property involved (in Latin, the *auctor*) at the time the agreement, as recorded in the charter, was drawn up. This may seem obvious—and it is tacitly assumed in most charters dealing with the transfer of rights over property—but it was nonetheless vital, as the few cases where such rights are disputed between two or more parties demonstrate. Challenges could be brought in court against ostensible owners on exactly this point, and the documents that record these occasions come closest to revealing what ownership was thought to mean in practice. If an accused individual was not the *auctor* of a property at the time of alienation or transfer, the resulting transaction would be deemed

invalid. This may seem vague to us, with our very precisely defined concepts of ownership: clearly, it did not necessarily encompass outright ownership. An *auctor* was merely the person most entitled to alienate a particular property. But did the quality of being *auctor* require possession too? Or a period of residence? Could it be inherited? In the absence of explicit discussions in the texts, it is hard to be sure; and the fact that the issue could be raised in court cases suggests that nonexperts may have been confused too, as well as trying their luck.

Probably it was most desirable to hold land in outright ownership, as this gave the individual powers of totally free alienation; but for most of the Middle Ages such powers were rare, being confined more or less to kings or those associated with kings. Other individuals could and did own land, but they seem mostly to have been invested with powers over property by the extended kin group in a sort of loose communal ownership. This pattern was particularly common among the Lombards and was very tenacious thereafter in Italy; one thinks of the *consorterie* of the late medieval towns. Such "ownership" gave household heads considerable political, as well as economic, power but nonetheless put great constraints on alienability, for which the consent of all or some of the kin group was usually necessary. The possessor of this property right—the most considerable tenure to which most free males could aspire—was usually expressed as *auctor*, a term that often seems to have meant "alienator" rather than "owner," as it conferred some ability to dispose of land rather than the exclusive right to do so. So *auctor* seems to have included current notions of ownership and alienation, depending on the circumstances. Most family land was transmitted through the generations by inheritance practices that conflicted with the ability of the head of the household to do as he liked. But the need for the kin to consent to alienation was not the same as real ownership in common: subordinate household members had little say in this, as in most other important decisions.

Ownership conditional on the consent of kin was merely one type—a common and long-lasting type—of land tenure. Complementing it were a variety of leases (*libelli*), long or short (up to thirty years); other forms of renting; benefice arrangements (*beneficium*); and temporary ownership or use (*ususfructus*). All these were initially granted out to the possessor for a limited time span, and some were feudo-vassalic in

character. Not until the central Middle Ages did these tenures take on hereditary forms, often against the wishes of the original grantors. Thus, land held by these means came to take on some of the character of inherited family land.

The most straightforward transmission of property was by inheritance, at least notionally. Although inheritance practices do not get full treatment in laws and charters, it seems to have been usual throughout the medieval period for property to pass within the kin group from father to children, especially males, without many problems. Primogeniture, transmission to the eldest son alone, was slow to develop in Italy, where partible inheritance remained more common, as many local studies have shown. How or if such customs were regulated in the earlier period we cannot know in the absence of relevant documentation. Wills granting property to sons were rare because they were unnecessary. More often we have wills concerning daughters, widows, and sisters. The *testamentum* was in a sense a theoretical expression of bequest, a record of what its author thought desirable after his death, of what should happen to his property in an explicit way, sometimes but not always made with pious intent. It was necessary in such a context to be clear about which rights were being devolved, and to whom, in order to avoid, as far as possible, *post obitum* disagreements within the extended kin group.

From such testaments it is possible to learn a great deal about inheritance practice insofar as it concerned women and churches, whose interests were often very much opposed to those of local families; but it must be stressed that the information in them is not typical of how inheritance operated in earlier medieval societies. Occasionally there are incidental references to men who had inherited land from fathers, uncles, or brothers, much the most typical custom. Overwhelmingly, most inheritance was from father to sons. Further, this society probably assumed that men could defend their own property, whereas women and their kin would benefit from having their "rights" set down in a charter to guard against challenges from the husband or his children. Similarly, it was easier to intimidate a woman, and so persuade her to part with her property.

Women—as mothers, wives, daughters, and sisters—predominate in charters dealing with heritable property because they represented the

easiest means by which family property could pass out of family control, either by marriage, by remarriage, or by entry into a religious community. They also had crucial power over reproduction within the family. On marrying, women received gifts of land from their fathers and husbands; and although documents recording formal divisions of family property at the time of marriage do not usually survive until the later Middle Ages, the law codes are clear on what the customary portions may have been: widows could not hold more than a quarter of their husbands' properties, for example. In spite of all this, the chances that women had to inherit and to control property were not great.

Transmission of property by inheritance was only one of the methods by which property passed from person to person in medieval Italian society. In times of war or other unrest, some people came to possess property as a result of theft, forcible confiscation, and other techniques unnoticed in charters. But charters, because they were instruments recording property transmissions, are an important source of material concerning the gift and sale of land described in formulaic terms using phrases such as *dono* and *trado ac cedo*, which reveal little about the actual processes of transfer. Sometimes sales or gifts were followed up with a *vestitura*, which recorded a ceremony on-site that involved walking the bounds of the property, transfer *per columna de casa* (touching the entrance of the house) or picking up the soil, *de terra atramentate*. These events represented the transfer of property rights at its most public and provide a reminder that charters alone were not always enough to ensure that a transaction gained the approbation of local worthies.

It is unclear how important these methods of tenorial transfer were in comparison with customary inheritance. Alienation by such methods certainly left more room for individual choice, even if it remains unlikely that family property could be alienated outside of the kin group by such means. It may be that in the eighth and ninth centuries the charters, which were hardly very numerous at that point in most places, were indeed recording types of alienation which were not yet common. But it is necessary to be cautious here, for even though we have documentation that deals primarily with the church, there are many instances of property being bought and sold by laymen alone. Some historians have argued there was a market in land at given times

in given places, especially in the vicinity of the northern cities such as Milan and Pavia, during the later Middle Ages. It might be the case that in some places there existed a real market in land—land being bought and sold as a commodity—a process which was disrupting traditional tenurial patterns. However, we have to be careful about this, too, because we know that many transactions which appear to fall into this category were conditioned by other relationships, social or political, between buyers and sellers.

Much of this discussion has had a theoretical slant because written texts can easily convey a false sense of the powers that men had over land if formulas are treated too literally. The *placita* demonstrate clearly that charters could very often be ignored, that there were people who did not believe them, who confiscated land by force and who persisted in denying claims to ownership for long periods. In this type of society, tenure guaranteed in writing was not so very secure. By the fourteenth century many of these earlier medieval uncertainties had no doubt disappeared, but even then it is important to be aware that what a text may imply may never have happened.

Landini, Francesco

Francesco Landini (c. 1325-2 September 1397) was a composer, organist, singer, instrument maker, and poet of the second generation of the Italian *Trecento*. He may have been born in Fiesole or Florence and was the son of the painter Jacopo Del Casentino (d. 1349), a cofounder of the Florentine guild of painters, Landini lost his sight after having smallpox as a child; as a result, he turned to music with a passion. He mastered several instruments, including the organ; worked as an organ builder, organ tuner, and instrument maker; and played, sang, and wrote poetry. As a scholar, he is recorded as following the teachings of William of Ockham, and he was knowledgeable in many areas of astrology, philosophy, and ethics. Landini was very active in religious and political events. His musical works indicate that he spent some time in northern Italy before 1370, probably in Venice. He was organist at the monastery of Santa Trinita in 1361; and from 1365 until his death he was *capellanus* at the church of San Lorenzo. His acquaintances included the Florentine chancellor of state and humanist Coluccio Salutati and the composer Andreas de Florentia. In 1379 and 1387, Landini was involved in building organs at the church of Santa Annunziata and at the cathedral of Florence. Giovanni da Prato, in *Il paradiso degli Alberti* (1389), a narrative poetic account of Florence, portrays Landini as an active musician and humanist, taking part in extensive philosophical and political conversations as well as singing and playing the organ. Landini died in Florence, in the church of San Lorenzo; his tombstone was discovered in Prato in the nineteenth century. A picture of Landini can be seen on folio 121v of the Squarcialupi Codex (I-FI 87). His fame continued well into the fifteenth century. The French musicologist Fétis rediscovered Landini's music in 1827.

Not only was Landini a very prolific composer, but the survival of his musical works attests to his popularity and importance. His extant works represent almost a quarter of the entire known repertoire of secular *Trecento* music. One hundred fifty-four works can be definitely attributed to Landini: ninety *ballate* for two voices, forty-two *ballate* for three voices, eight *ballate* that survive in two-part and three-part

versions, one French *virelai*, nine madrigals for two or three voices, one three-voice canonic madrigal, and one *caccia*. Works of doubtful authenticity include two or three *ballate* for two voices, and four motets with fragmentary single voices. More than 145 works by Landini are contained in the Squarcialupi Codex.

Landini's musical style is multifaceted; he wrote works ranging from simple dances to complex isorhythmic and canonic pieces. His compositional technique is often described as a synthesis of French and Italian musical influences. The melodic inventiveness of Landini's music is readily apparent. A special musical cadence—which musicologists call the Landini cadence—appears frequently in his music; it is recognizable at the end of phrases as a leaping upward by an interval of a third. Landini's music points toward the polyphonic imitation in fifteenth-century early Renaissance music.

Lanfranc Cigala

The troubadour Lanfranc *Cigala* (d. 1258), a jurisconsult and councillor of the Genoese republic, appears in documents in 1235, 1239, 1240, and 1257; in 1241 he served as ambassador of Genoa to Raymond Berenger V of Provence.

Lanfranc's poetry consists of eight early love poems (written in the 1230s), four *cansos* in honor of the Virgin, two crusade songs, and eighteen poems on various other topics. Among these eighteen is a vehement *sirventes* (poem of blame) against Marquis Boniface II of Monferrat (the nephew of Raimbaut de Vaqueiras's patron and friend), because of his continual maneuvering between the emperor and the pope. When, in 1245, Boniface again adhered to the party of Emperor Frederick II, Lanfranc (whose city, Genoa, was allied with the pope) accused Boniface of heresy, perjury, accepting bribes, and worse. During the same period (1244-1245), Lanfranc composed a crusade song admonishing the kings of France and England, the Germans and the Spaniards, the count of Provence, and even the pope to take up the cross; in the second *envoi* he turns to Frederick II: "Emperor, remember to lend your help, because God, thanks to whom every king reigns, asks it of you, and make peace here and succor there, since death does not spare emperors." Lanfranc's call would be answered a few years later by Saint Louis.

At one time Lanfranc celebrated his lady's smile—the sweet smile that brings *joi e alegria e vol amoros* ("joy and cheerfulness and amorous will")—and indeed was the best troubadour ever to sing of women's smiling lips. His cult of the ideal woman made him a precursor of the *dolce stil miovo*. Eventually, however, all that was gone, with nothing left except bitterness. Lanfranc then sang of and invoked only Mary, the lady of ladies, who represented for him the supreme feminine ideal.

Lanfranchi Da Pistoia, Paolo

The innovative lyric poet Paolo Lanfranchi (fl. second half of the thirteenth century) was born in Pistoia. We have few facts about his life. It appears that he was in Bologna on at least two occasions—in 1282 and again in 1283—and there is evidence that between the years 1283 and 1285 he resided at the court of King Peter III of Aragon. Six years later, as a penalty for stabbing a fellow citizen, he was exiled from Pistoia; and in 1295 he is reported to have been in Bologna once again.

Lanfranchi composed eight extant sonnets, including one in Occitan addressed to Peter III. Of his seven sonnets in Italian, two treat the theme of the wheel of fortune and five are concerned with the vicissitudes of love. The sonnets present a series of events that could, with a certain degree of imagination, be viewed as a small "*canzoniere*" in which the poet relates amorous adventures occurring in a dreamlike

state. On awakening from this idyllic state and finding himself confronted with harsh reality, the poet vows to become a heretic (a Patarine). Stylistically, Lanfranchi's sonnets are in the Siculo-Tuscan tradition. His sonnet in the *langue d'oc* (*Valenz senher, reis dels Aragones*) celebrates the life and deeds of Peter III and may be considered a sort of encomium, perhaps composed in the final days of Peter's life.

Language, Italian: History and Development

In reference to the Middle Ages, we must first speak of Italian languages, rather than any single Italian language. Romance-language historians generally accept that in the early Middle Ages, the linguistic character of Romance-speaking Europe can be described as a web of cognate dialects directly descended from Latin, with mutual comprehension decreasing as distance between them increased. Eventually, and for different reasons in each area, individual dialects would be selected for refinement and promotion to the status of standard language for both literary purposes and practical affairs, but this process would not take root in Italy until after the medieval period, and the language now labeled "Italian" would not be the language of the majority of inhabitants of the peninsula until well into the twentieth century. The linguistic landscape of medieval Italy consisted of Latin as superordinate for written purposes, with local Romance as the spoken medium in ordinary communication.

It was once common to view the Romance descendants as beginning to emerge from the Latin parent during or even after the reign of Charlemagne (800–814), when attention is first paid to writing direct representations of the common spoken language. It is now recognized, however, that what emerged were texts, not the vernacular languages themselves. The first manifestation of writing in a Romance tongue in which orthographic conventions, syntax, morphology, and phonological structures are clearly intended to represent popular speech—the northern French *Serments de Strasbourg*—is from 842. The language used is fully emancipated from Latin, and comparison of the earliest texts from throughout the geographical continuum of Romance Europe shows that most local features which today distinguish one Romance language from another were already well developed. A lack of documentation precludes identification of the period of incipience of most changes, but they must have arisen much earlier than the texts in question, as is evident from the general observation that change in a language is typically a slow process.

It is safe to assume from both modern and historical evidence that during the early Middle Ages the Italian peninsula was characterized by

a collection of local languages generally quite similar to those of today—with the obvious exception that no intrusions from a supraregional vernacular standard would have been found, since such a language did not yet exist. With this background, it is clear that the concept of the "birth" of Italian, in the sense of linguistic generation, is an infelicitous metaphor. Florentine, which would supply the linguistic base for an eventual national language, was, at the millennium, one of the innumerable spoken dialects of the Romance area, the natural development of popular Latin in one location.

The standard languages of Europe are in each instance a result of selection or one local variety as a means of written communication, accompanied by the establishment of orthographic and grammatical norms. The case of what would become known as Italian is unique among the major Romance languages in that the preeminence of Florentine was based on the literary success of its first writers, rather than on the political prominence of its most influential speakers. Although the prestige of Florentine would later be reinforced considerably by the hegemony of Florence as a center of power and culture, the initial selection of the dialect as a linguistic model is attributable to the fact that medieval Florentine was the native language of Dante Alighieri, and that the norm he set in linguistic matters was easily approximated by the Tuscans Petrarch and Boccaccio, whose native speech forms were quite similar to those of Florentine.

It should be noted, however, that the written code has never been a truly faithful representation of Florentine speech in all its detail. The written language of *Tre corone* is an idealization on a Florentine base and thus is Florentine, or at least central Tuscan, in essence, but it is consciously purged of local features judged to be displeasing. Dante, in *De vulgari eloquentia* (1.13), made it quite clear that he felt that neither Florentine nor any other Tuscan variety was a fit vehicle for literary expression. From today's perspective his pronouncements are frustratingly vague in their lack of detail, but he ridicules Florentines, Pisans, Aretines, Siennese, and Lucchese for their speech, and although he judges that the Florentines Guido Cavalcanti and Lapo Gianni, and Cino da Pistoia from nearby Pistoia, managed to turn out excellent *volgare*, they are exceptional. Their success, in fact, is due to the

distance they placed between their genuine Tuscan and the language of their poetry. *Hoi polloi* and even most of the lettered are possessed of *turpiloquio*. In Dante's view, Guittone d'Arezzo, Bonagiunta da Lucca, Gallo Pisano, and Brunetto Fiorentino use language which he describes as not curial but municipal; thus their production cannot serve as a model for the *volgare illustre* which Dante seeks to establish.

To a certain extent, Dante did not follow his own prescription to establish the *volgare* as a language identifiable with no particular place, but rather as an amalgam of the best features of Italian speech types; in the end, he used the language he knew best. On the other hand, while it is not a true *koine*, the language of his *Commedia*, *Vita nuova*, and so on is definitely conventional and relieved of many local traits, quite likely not the Florentine of Dante's own everyday speech, and certainly not faithful to the speech of the people.

The details are missing—perhaps they were to have been presented in Book 3 of *De vulgari eloquentia*, which was either lost or never written—but a few facts concerning what Dante disapproved of are known, and others can be surmised. We can expect no phonetic detail, on two grounds. First, such detail is simply not part of a phonemic orthographic system, which the medieval Italian system was. Second, and less tautologically, low-level phonetic detail is all but universally missing from literary production of the time, for aesthetic reasons. Dante was breaking ground by composing in the vernacular, but his sentiments were conservative. Although his mention of phonetics is quite brief, and (as is to be expected) somewhat entangled in a discussion of orthography, he states outright that colloquial registers are to be avoided. The language of literature must be *illustre*, must be made to shine; and to shine it must be raised to a sublime level:

When we say *illustre*, we mean something that illuminates and shines in its luminescence. . . . And the vernacular we are speaking of is raised to the level of sublime by learning and by power, and in turn exalts its users with honor and glory.

(*De vulgari eloquentia*, 1.17)

To be made *illustre*, the vernacular requires a good bit of polish:

We see it made sublime by learning in that it is purged of the Italians' crude

words, of confused constructions, of defective pronunciations, of rustic accent; it is rendered noble, fluent, perfect, and elegant, as Cino da Pistoia and his friend [i.e., Dante himself] do in their poetry.

(*De vulgari eloquentia*, 1.17)

Dante has firm ideas regarding word choice, and in this realm he is fairly explicit (*De vulgari eloquentia*, 2.7). The elements of vocabulary can be childish, womanish, or mannish; and among the elements in the last category it is possible to distinguish country from urban. All but urban terms are to be avoided. Children's expressions such as *mamma* and *babbo* are not worthy of consideration; women's words are too soft; country terms are too crude. Even once the list is reduced to the manly and urbane, care must be taken to use only those words which are well groomed, or truly noble, not those whose substance goes up in smoke on reflection. Words consisting of three syllables or thereabouts are preferable, although there are two types of exceptions; certain unavoidable monosyllables are, of course, acceptable, such as *sù*, *no*, *me*, *te*, *se*, *a*, *e*, *i*, *o*, *u'*(from the Latin *ubi*); also admissible are the worthy ornate words, which (although incorporating what Dante feels are harsh phonic features such as aspiration or geminate liquids, containing unpleasant stress,

or

in principle excessively long) mix successfully with well-groomed terms to produce a harmonious effect: *terra*, *honore*, *speranza*, *gravitate*, *alleviato*, *impossibilità*, *impossibilitate*, *beneventuratissimo*, *inanimatissimamente*, *disavventuratissimamente*, *sovramagnificentissimamente*.

Although Dante found it impossible to live up to these standards in practice, it is clear that his writings do not reflect casual speech. Even with the relaxation in these strict constraints, which was inevitable in the production of vernacular verse, his purpose was lofty, and we hazard little in assuming that his works are unlikely to contain attempts at phonetic representation of popular speech. Thus, for example, although we cannot date the origin of the fricativization known today as the *gorgia toscana* (e.g. [*la hasa*] "the house"), we should not be surprised to find no sign of it in Dante's works; and it is to be expected

that he generally avoided popular distortions such as [sk] for etymological/st/ (*crischiano*, "Christian"). We can assume that his lexical choices tended to exclude anything he deemed ignoble, and though we have no direct statements on the matter, the restriction on monosyllables unless they were unavoidable may well signal intentional avoidance of such typical Florentine details as clitic subject pronouns. In sum, the poet's noble purpose and his considered judgment conspired to forge a linguistic code at some remove from genuine speech, yet it cannot be denied that the *Commedia* and other of Dante's vernacular works are most certainly written in language identifiable as being of a Florentine type.

The success of the Florentine model was such that, for all but the most rustic of speakers, numerous competing local forms elsewhere in Tuscany would eventually be ousted in favor of its prestigious norms. *Ogni* supplanted *ogne* ("each"); *mila* replaced *milia* ("thousands"); the vocalism that marked first-person plural subjects by verb class (-*amo*, -*emo*, -*imo*) gave way to -*iamo*. An interesting case of ongoing grammatical change in the Middle Ages is found in the fate of the masculine definite article. The Latin demonstrative *illu* and its inflected forms seem to have developed first into a compact quadripartite inventory *lo*, *li*, *la*, *le*. The first of these has two forms, however: *lo* following consonants (fossilized in today's *per lo meno*), and the reduced form [1], which is possible, though not absolutely required, following vowels. At this stage, *lo* is dominant: *per lo sole*, *lo sole*, *ove lo sole-ove* [/J *sole*. By Dante's time a third variant has arisen, with the addition of prothetic [i] to the form [1], though Dante is comfortable with both *il* and simple [1]: *ha fatto il sol tragitto* (*Inferno*, 34.105) and *temperava il novo giorno* (*Purgatory*, 28.3) alongside *e 'l sol montava* (*Inferno*, 1.38) and *avvegna che sia 'l mondo* (*Paradiso*, 20.60). It should be noted that the modern transcription 'l is somewhat controversial at this point. Before full incorporation of *il* it is misleading, as it suggests reduction of *il* rather than of *lo*, and we cannot be absolutely certain that Dante's *e 'l sol montava* represents aphaerized *il* rather than a remnant of apocopated *lo*. A second ongoing change that shows up in texts toward the end of the 1200s is a shift in the order of clustered clitic pronouns from the type *lo mi* to *me lo*. The enclitic possessive, now relegated to speech south of Tuscany, appears to be on its last legs

during this period: Florentine *mogliema* ("my wife") and *càsasa* ("his house," "her house"); Sienese *fratelma* ("my brother") and *cognátoma* ("my brother-in-law").

Further settling and selection of variants would follow from the late Middle Ages onward. Beginning in the 1500s—although presaged tangentially by Leonardo Bruni's muddled pronouncements on the origin of the vernacular and its relation to Latin—debate would rage over the character of the vernacular to be used. Known as the *questione della lingua*, this multifaceted mix of logical argument and impassioned polemic pitted supporters of Tuscan against more catholic anti-Tuscans; archaists longing for the glories of *Tre corone* against those who argued for more contemporary usage. In the end—notwithstanding foreign borrowings, penetrations from Latin, and acceptance of local forms from outside Tuscany—the language that is now known as Italian remained firmly Tuscan, specifically Florentine, in its essence.

Lapo Gianni

Lapo Gianni (fl. c. 1300), a poet of the *stil novo* tradition, has been tentatively identified as Lapo di Gianni Ricevuti, a judge and notary who appears in Florentine documents from 1298 to 1328, although there are a number of other very plausible candidates. The whole of Lapo's extant poetry consists of eleven ballads, three complete *canzoni*, one partial *canzone*, and a beautiful double sonnet, composed in the Provençal *plazer* style (*Amor, eo chero mia donna in domò*). Lapo belonged to a small circle of friends that included Dante Alighieri, Guido Cavalcanti, and Cino da Pistoia. Dante mentions Lapo affectionately in *Guido, i' vorrei che tu e Lapo ed io* (*Rime*, 52) and, even more significantly, counts him among those who knew best how to attain excellence in the vernacular (*De vulgari eloquentia*, 1.13.3).

Lapo's poetry displays an authentic psychological interest in the nature and origin of love, but a somewhat loose adherence to the principal tenets of the *stil novo* so clear in the work of Dante and Cavalcanti. In Lapo's verses, love can both torment and soothe its victim, without causing the more profound psychological anguish and despair present in Cavalcanti (e.g., in *Eo sono Amor, che per mia libertate*). The nobility of the heart that induces a lover to dedicate himself to his lady produces in itself an interior joy that, regardless of the accompanying distress, provides an agreeable source of solace. Thus, the suffering of the lover can never reduce him to the same misery that is common in the poetry of the other *stilnovisti*. Though Lapo's language is unpretentious and his tone occasionally seems excessively optimistic (as in *Q'uest'angela, che per di ciel venuta*), these characteristics do not diminish the artistic quality of his poetry.

Latin Language

As most of Italy slipped out of the Roman empire during the fifth and sixth centuries after Christ, the majority language of the peninsula and its associated islands remained Latin. This Indo-European tongue had been spread by succeeding polities centered on Rome, first throughout much of Italy and later more widely in the western Mediterranean basin and beyond. By the end of the tenth century, with a few exceptions (some German-speaking Alpine areas; the Greek-speaking parts of today's Calabria, Basilicata, and Apulia; and Sicily, still partly Greek and now increasingly Arab), the majority language of Italy was one or another form of Romance: Italian for most of this area, and Sardinian, Occitan, Franco-Provençal, and varieties of Rhaeto-Romance in some peripheral regions. These tongues, like the other Romance languages (e.g., Spanish, French, and Romanian), developed out of a Latin that itself was far from uniform. In one sense, they are all varieties of Latin, a language that in this view (which de-emphasizes major perceived differences between Latin and Romance) is today spoken by nearly a quarter of the world's population.

The language we call medieval Latin was a continuation of the formal written Latin of the empire. This written Latin had become somewhat different from spoken forms of the language by the first century after Christ, and diverged even more noticeably by late antiquity, as the spoken language underwent increasing phonological and morphosyntactical change. These developments continued during the early Middle Ages. Although the divergence was largely due to the conservatism of the written language, that language was not entirely static.

In particular, the written Latin of late antiquity (part of the late Latin out of which both Romance and medieval Latin evolved) existed in several registers that differed in style, vocabulary, and syntax. Writing destined for popular audiences was by design closer to ordinary speech than were elite literary or governmental texts, and thus tended to be more open to new or newly common morphological and syntactical practices. Also, the spread of Christianity during the third century, and its preferential treatment by the Roman state during the fourth century, brought into being a specifically Christian literature with new terms (including many words imported from the first international Christian language, Greek) and new meanings for older terms. All these departures from the prevailing classical standard may be found in the Vulgate version of the Bible and in other texts that came to have a formative influence on Latin in the Italian Middle Ages.

The extent of literacy (in its various senses) in Italy during late antiquity is a matter of opinion. However, the higher literacy necessary to sustain literary culture seems to have declined toward the end of this period; it certainly fell off drastically during the upheavals of the sixth century. Thereafter, written Latin was perpetuated in extended or literary forms chiefly by, and usually for, educated elites within the church. Evidence from sources such as charters suggests that there was also a broader functionally literate population—that is, people with lower levels of literacy. The surviving Latin of the early Italian Middle Ages is primarily ecclesiastical, legal, and administrative; but it includes writings in other fields (e.g., grammar and medicine) where traditions of learning persisted or were soon revived. Like almost all medieval Latin, it shows considerable lexical innovation caused by altered circumstances. Prominent among these were changes in social and

political institutions, contact with other languages (especially Old High German in its Lombard form), and developments in trade and technology.

Stylistically, medieval Latin is usually a simplified version of the middle and lower registers of its late antique predecessors; in literary texts, imitations of and developments from older high-style writing also occur. Syntactically, it reproduces, with modifications, the norms prescribed by grammarians of late antiquity. Orthographically, there is considerable variation, as mechanisms of standardization were in general not strong. But the broad-scale phonological changes that were already under way during late antiquity (e.g., the loss of quantitative vowel distinctions) also gave rise to some fairly standard departures from previously accepted spellings, as well as to fundamental changes in rhythmic prose and verse (both became accentual rather than quantitative). These innovations continued to characterize most forms of Latin throughout the medieval period.

With the economic revitalization and population growth of the eleventh and twelfth centuries came a general increase in learning in western Europe. A spoken Latin based on written texts (whose pronunciation had been standardized in Frankish territories by the Carolingian reforms of the late eighth century and early ninth century) became widely diffused among educated people (who were now more numerous) and was promoted by the church of Rome as its medium of oral communication, both liturgically and internationally. Although the differentiation between Latin and Romance was effectively complete (or, in the view of some, soon would be), Latin was in most cases still the more prestigious language for anything that had to be written. A lay public that could read Latin developed gradually among professions such as notaries, and lay schoolmasters who taught more than formulaic Latin literacy began to compete with their monastic and clerical counterparts. As universities were formed in the twelfth and thirteenth centuries, their official language of administration and instruction was also Latin.

New, more specialized forms of medieval Latin based in different disciplines (e.g., law and medicine) also came into being. The discipline of letters proper (*grammatica*) fostered a style of usage based on the study and imitation of a wider range of ancient texts than had hitherto

been used in Latin education. (There had been an earlier movement in this direction under Charlemagne, but it was more limited and produced few lasting results in Italy.) Latin of this sort, including some quantitative verse, continued to be taught and written throughout the Middle Ages and was read by such figures as Petrarch and Coluccio Salutati, who in the fourteenth century promoted the more rigorous return to ancient Latin modes of expression that characterizes Renaissance humanism.

In the twelfth and thirteenth centuries, there evolved yet another form of medieval Latin, based on theology and philosophy: scholastic Latin. Thomas Aquinas and other Italians were to have a hand in shaping this new scientific idiom in its mature stages. Once its conventions were understood, scholastic Latin conveyed complex intellectual argument with a brevity and precision surpassing the perceived capacities of more traditional Latin discourse. It developed as the special vehicle of Christian Aristotelianism, rapidly permeated other disciplines, and became dominant in the universities, where it lasted well into the early modern period.

During the thirteenth century, an increase in urban populations, together with the existence of several universities, brought Italy to its greatest extent of higher literacy in Latin since antiquity. Latin—as the language of public record (for the most part), of canon and civil law, of theology, and of general intellectual discourse—was thought essential for the growing number of lay professionals and, in some places, for merchants. It was also a requirement for the new body of preachers who were expected to mediate between the written wisdom of the church and a general public largely ignorant of the learned language. Vernacular literacy also gained ground during this century and the next, and as this occurred Latin ceased to be the language of public law and secular administration. However, by the mid-fourteenth century Latin was still the primary language of the liturgy, of learning, of some forms of official record, and of diplomacy between governments. It also continued to serve as an international *lingua franca*—much as English does today, except that, unlike English, it was no one's native tongue. These uses were to outlast the Middle Ages.

Latin Literature

The Latin-language literature of medieval Italy is extensive. It was centuries older than its Italian-language counterpart and was still being added to as the medieval period ended. Indeed, for all of this time, Latin was Italy's principal literary language. Even in the fourteenth century, when Italian was increasingly being used for literature, Latin retained its cachet as the language of tradition, permanence, prestige, and—to the extent that this mattered—comprehensibility abroad. The literature created in Latin encompassed, across a wide variety of genres (including some now thought of as nonliterary), writings whose qualities were considered valuable and distinct from the qualities of ordinary pragmatic discourse. Because

forms of Latin literature were taught as part of grammar and rhetoric, pertinent contributions in these allied disciplines are also included even when, as is often the case, they are themselves stylistically routine. Latin was international; it was used in many places besides Italy, and texts written in Latin could circulate widely. Thus, especially in the case of anonymous works, the ascription of an Italian origin is sometimes no more than probable. There is also uncertainty regarding dating and authorship. Titles could change and were often not auctorial: those in use today are frequently the choices or creations of modern scholars. Many texts are only incompletely preserved, and many (including some notable enough to mention here) have as yet no modern critical edition.

In late Roman antiquity (approximately from the crises of the third century to those of the sixth), literary styles and forms were transmitted across generations by processes of teaching and imitation that favored earlier written texts above the changing oral language. Beginning in the sixth century—which saw both the eastern Roman (Byzantine) war against the Goths and the Lombard invasion—and continuing into the eighth, economic conditions and overall levels of education in Italy were unfavorable to significant literary creation in any idiom, let alone in Latin, whose exemplars diverged considerably from current speech practices. However, at the start of this period, there were still some classically trained ancient-Latin authors. Among them were prominent figures from the Gothic kingdom, such as Ennodius (d. 521), an ecclesiastical poet and prose writer who was probably born in southern Gaul but was active mostly in northern Italy; the statesman and philosopher Boethius (d. 525 or 526); Cassiodorus (died c. 580), a high government official who later became a monastic; the elegiac poet Maximian (early sixth century); the hagiographer Eugippius (d. after 532); and the epic poet Arator (d. after 543).

The last writers of note in this tradition suggest the changes that were then under way. Venantius Fortunatus (c. 535—early 600s) inaugurated a long tradition of *kalians* who were active as authors wholly or mainly outside Italy. In 566, he moved to Merovingian Gaul, where he produced a sizable body of polished secular and religious verse, as well as hagiographic and other prose; at his death, he was bishop of Poitiers. The line of ancient poets writing in Italy seems to end with Marcus, the author, at Monte Cassino, of an elegy praising

Saint Benedict (c. 570). Pope Gregory the Great (c. 535 or 540-604) wrote (in a much lower stylistic register than Venantius) biblical commentaries, sermons, numerous prose letters, and the largely hagiographic *Dialogues*. The undemanding syntax and edifying content of these works made them popular in monastic circles for a long time. An even humbler, but well written, work is an account by "Anonymus Placentinus" ("Anonymous of Placentia," i.e., Piacenza) of a tour to the Holy Land and Egypt undertaken by a group of pilgrims from the author's city shortly before its fall to the Lombards in 570. Diverse as they were in education and attainments, none of these authors had immediate successors. A rupture had taken place and, from a literary standpoint at least, the Italian Middle Ages had begun.

From the seventh century through the twelfth, Latin literature was created and transmitted chiefly in monasteries and in urban episcopal centers. Its forms were usually derived, either directly or through more recent intermediaries, from ancient Christian writings available for imitation. Some non-Christian authors were also read and occasionally imitated. In addition to biblical commentary, sermons, letters, and hagiography, there were liturgical and other devotional texts; monastic, episcopal, and city chronicles; and narrative histories exemplifying divine providence. Educational needs gave rise to treatises in grammar and in other arts. There were also praises of cities and rulers, personal and civic lyrics, mnemonic verses, and displayed writings of a literary nature (e.g., verse inscriptions on the exterior of buildings or at burial sites inside a church). These forms and practices remained in use throughout the Middle Ages. Verse could be either "rhythmical" (accentual) or "metrical" (quantitative); both systems were inherited from antiquity, but metrical verse was more difficult to master because of an absence of spoken quantitative vowel distinctions. Accentual verse was ordinarily of the accentual-syllabic variety. Accentual templates of quantitative verse forms were also used. Most liturgical and other sung verse was accentual.

Little remains of medieval Latin literature during its infancy in the late sixth century and the seventh. From Rome, starting in the sixth century and continuing until at least 707, we have a series of brief papal epitaphs in verse, the longest being that for Gregory the Great. From Lombard centers in the north, we have a noteworthy letter from John—

the patriarch of Aquileia—to King Agilulf (605 or 607) and an epitaph in fourteen elegiac distichs for the bishop of Como, Agrippinus (d. 620). The founder of Bobbio, the Irishman Columban (died c. 615), wrote, during his Italian period, an elaborate letter and quite possibly two rhythmical poems and the thirteen sermons attributed to him. Not much later came Jonas of Bobbio (Jonas of Susa, c. 600–after 665), the biographer of Columban and his early successors, also active in Burgundy. Formal letters of some artistry, all having to do with monothelism and preserved in the acts of the sixth ecumenical council, were sent to Constantinople in 679 by the synod of Milan under the leadership of its archbishop, Mansuetus (this letter is sometimes ascribed to Damian, the future bishop of Pavia); and in 680 by Pope Agatho and by Agatho and the synod of Rome. Also from Rome are an epitaph in verse for the Anglo-Saxon king Caedwalla (d. 689) and the seventh-century lives in the papal chronicle *Liber pontificalis*. At the end of the seventh century, the monk Stephen composed for the Lombard king Cunincpert an awkward but linguistically interesting poem on the synod of Pavia (698). Some hagiographic texts (e.g., Audelaus's *Life* of Saint Fortunatus of Spoleto) could also be from these centuries; others that appear to originate in this period exist only in somewhat later versions.

Several literary authors of the eighth, ninth, and tenth centuries are prominent. Ambrose Autpert (d. 784)—who was born in Provence but was active at San Vincenzo al Volturno from c. 740—was a biblical commentator, spiritual writer, and local historian and hagiographer. Paul the Deacon (c. 720–c. 799) was one of the leading figures of the Carolingian educational reform and, during his retirement at Monte Cassino, the historian of the Lombards. Two other figures at the Carolingian court were the poet and grammarian Peter of Pisa (d. before 799) and the theologian and poet Paulinus of Aquileia (d. 802). Agnellus of Ravenna (c. 805–c. 855) was a historian. Anastasius Bibliothecarius (died c. 879), a papal secretary and translator, was the principal author of Pope Nicholas I's eloquent and forceful letters to Constantinople. A late ninth-century poet named Johannes composed a rhythmical version of the popular biblical parody *Cena Cypriani* (*Cyprian's Dinner*); Johannes is usually, though not certainly, identified with the Roman writer John the Deacon (Johannes Hymmonides, c.

825-880 or 882), the biographer of Gregory the Great. A Campanian poet, Eugenius Vulgarius (late ninth century-early tenth century), is notable for his figure poems and for his command of an unusually wide range of lyric verse forms. Two prose satirists and ecclesiastical authors are Atto of Vercelli (died c. 960 or 965) and Rather of Verona (c. 887—974). Rather was born and died in Lotharingia, but spent most of his career in Verona, as his name implies. Liudprand of Cremona (Liutprand, c. 920-after 971) was a gifted political writer and propagandist.

Francesco Petrarca, *De Remedii Utriusque Fortunae Libri duo*. Rotterdam: Ex Officina Arnoldi Leers, 1649. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

There are other writers as well from the eighth, ninth, and tenth centuries. Coronatus was the author of the prose *Life* of Saint Zeno of Verona (late eighth century). Alderic of Benevento (fl. c. 830) was a poet. The Veronese archdeacon Pacificus (d. 844) was a scribe and poet.

Three figures were associated with Monte Cassino during the ninth century: the grammarian and poet Hilderic or Ilderic (possibly two people of the same name), the abbot and poet Berthar (d. 883), and the historian and poet Erchempert (d. after 888). Two Neapolitan hagiographers were John the Deacon (late ninth century-early tenth century) and Peter the Subdeacon (fl. c. 919 c. 970). The Salernitan abbot John the Italian (Johannes Italus, Giovanni Romano; fl. c. 942) was the author of a *Life* of Saint Odo of Cluny. The scholar Gunzo (sometimes equated with Gunzo of Novara, one of Atto of Vercelli's correspondents), in 965 or shortly afterward, wrote a long, literarily informed letter of justification on a point of grammar to the monks of Reichenau in southern Germany. The writer known as Benedict of Mount Soracte (or of San Andrea) produced a chronicle (late 960s-early 970s) that is ungrammatical but notable for its narrative of Charlemagne in the east and its concluding lament for Rome, sacked by soldiers of Otto I.

Significant anonymous prose literature from this period includes the following works: a *Life* of Saint Syrus of Pavia (c. early eighth century); lives from the eighth- and ninth-century portions of *Liber pontificalis*; a *Life* of Saint Gaudentius of Novara (mid-eighth century to early ninth); the first *Life* of Saint Barbatius of Benevento (ninth century); a longer *Life* of Barbatius (late ninth century); a *Translation* of Saint Athanasius of Naples (whose modern ascription to the translator Guarimpot is uncertain); a *Life* of Saint Marinus of San Marino (ninth or early tenth century); *Chronicon Salernitanum* (left unfinished c. 975), covering more than two centuries in the history of the southern Lombard principalities; and a Venetian *Translation* of Saint Mark (usually thought to be from the tenth century, though it has also been assigned to the eleventh).

Noteworthy instances of anonymous verse from these centuries include the following: a fair number of epitaphs, some of exceptional quality (later eighth century onward); descriptive poems on Milan (early eighth century) and on Verona (between c. 796 and c. 805); a rhythmical *Life* of Saint Zeno of Verona and a technically similar poem on the nativity, *Audite omnes versum verum magnum* (late eighth century); poems celebrating King Pepin's defeat of the Avars (796) and lamenting the death of Charlemagne (814); "alphabetical" poems on the

destruction of Aquileia (c. early ninth century, dubiously attributed to Paulinus of Aquileia), against its restoration (mid-ninth century), and on Abbot Bobulenus of Bobbio (ninth or tenth century); some of the hymns in the central Italian collection once known as *Hymnarius Severinianus* (compiled in the late ninth or very early tenth century, and with a few later additions); *Carmina Mutinensia*, three poems of civic defense from Modena, including an impressive song for the watch on the city walls (late ninth century); *Lamentum refugae cuiusdam*, the plaint of a monk who has left Bobbio for Verona and wishes to return (late ninth or early tenth century); a sapphic ode to Bishop Adalard of Verona (875-915); the epic poem *Gesta Berengarii imperatoris* (*Deeds of the Emperor Berengar*, early tenth century); and *Carmen in assumptione sanctae Mariae* (*Poem on the Assumption of the Holy Mary*), composed for the Roman festivities of the year 1000.

Probably tenth-century, but possibly later, are a metrical *Translation* (to Benevento) of Saint Mercurius, an epitaph in verse for Abbot Aligern of Monte Cassino (d. 986), and the lyrics *O Roma nobilis* and *O admirabile Veneris idolum*. Two works are dated to c. 1000: the ballad *Foebus abierat* and a Roman *Life* of Saint Adalbert of Prague. Spanning the later tenth century and the early eleventh are a number of verse epitaphs from Rome, the Venetian chronicler usually identified as John the Deacon (d. after 1017), and the epistolographer and occasional poet Leo of Vercelli (d. 1026). (An epistolographer is a writer of letters—one of the most characteristic genres of medieval Latin literature.)

Eleventh-century authors and texts of note include the following: the musicologist Guido of Arezzo (c. 992-after 1033); the poet and prose writer Peter Damian (c. 1007–1072); the poem *Euge benigne* and other lyrics from the papal *schola cantorum* in Rome (some of these may be earlier); the anonymous sermon on the transit of Saint Constantius of Capri (early eleventh century); the so-called rhythmical *Life* of Hadrian III from Nonantola (c. mid-eleventh century), in metrical Leonine hexameters; the writer on rhetoric Anselm of Besate (fl. 1046-1054); the lexicographer Papias; *Chronicon Novaliciense* (*Chronicle of Novcllesa*, completed c. 1055), an imaginative and highly literary work; the historian Arnulf of Milan (c. 1000-after 1076); *Historia Mediolanensis* (*Milanese History*, consisting of three books) by "L." (often referred to as Landulf senior, fl. c. 1076); the imperial polemicist Benzo of Alba (d.

1089 or 1090); the hagiographers Andrew of Strumi (Andrew of Parma, fl. c. 1075—c. 1092) and John of Lodi (c. 1040-1105); *Heu, male te cupimus!* and *Sub vespere Troianis menibus* (c. later eleventh century), two verse laments for the Trojan hero Hector; *Versus Eporedienses* (*Verses from Ivrea*, c. 1080), an amatory poem sometimes ascribed to one Wido (Guido, the putative author of brief hymns in honor of saints); the poet, canonist, and writer on metrics Deusdedit (a French cardinal active in Rome; d. 1098/ 99); five prayers and the sermon *De cantata* (*On Charity*) by Anselm of Lucca (d. 1086); the bible commentator and spiritual writer John of Mantua (fl. c. 1082); a prose *Life of Anselm of Lucca* by the priest "B." (1086-1087, formerly ascribed to a canon named Bardo); *Carmen in victoriam Pisanorum*, a poem recounting a successful raid by Pisans and others on the North African port of Mahdia in 1087; and narratives of the translation of Saint Nicholas of Myra by Nicephorus of Bari (1087) and John the Archdeacon (c. 1088).

An important center at this time was the great abbey of Monte Cassino. Among its authors during the eleventh century and the early twelfth century were the following: the poets and hagiographers Lawrence of Amalfi (Laurentius of Monte Cassino, died c. 1050) and Gualaifer (Waifer, later eleventh century); the historian and poet Amatus of Monte Cassino (born c. 1010); the poet and medical writer Alfano of Salerno (Alphanus, d. 1085); the abbot and hagiographer Desiderius (later Pope Victor III, d. 1087); the rhetorician, hagiographer, and poet Alberic of Monte Cassino (c. 1030-before 1106); the hagiographer and prose stylist John of Gaeta (later Pope Gelasius II, c. 1062-1119); and the chronicler and hagiographer Leo Marsicanus (Leo of Ostia, d. 1115). Tropes (small supplementary musical and verbal compositions) in Cassinese liturgical manuscripts of this period are unusual in their frequent and often elegant use of classical verse forms.

Other figures and works also possibly or certainly span these centuries. William of Apulia and Geoffrey Malaterra (both fl. 1090s) were, respectively, the epic poet and the foremost prose historian of the Norman conquest of the south. Adelfer of Trani and others recorded the life and miracles of Saint Nicholas the Pilgrim (d. 1094). Rangerius of Lucca (d. 1112) and Donizo of Canossa (d. after 1135) were poets. Gregory of Catino (c. 1060-after 1130) was the chronicler of Farfa.

Bruno of Segni (c. 1050-1123) was a theologian and homilist; his supposed authorship of the hymn *Quis est qui pulsat* is at best uncertain. Roughly contemporary works are *Novus Avianus* (*New Avianus*, verse fables), by a writer from Asti; a versified office from Venice for Saint Euphemia and her companions; the *Translation* of Saint Bartholomew from Lipari to Benevento by the priest and monk Martin; and the Beneventan *Life* of Leo IX, addressed to a venerable father, Landulf.

Liturgical drama, a genre characterized by local variations within larger conventions widely followed in Latin Christendom, is first recorded in Italy in the eleventh century. Its initial and most common manifestations are tropes or trope-like ritual texts involving small dramatic performances. Well-known examples with versions from Italy as well as abroad are the Easter and Nativity dialogues *Quem queritis* [*in sepulchrolin presepe*]. A related sequence (a liturgical song with internal responsions), *Quem queritis mulieres*, is probably of Beneventan origin. In the twelfth century longer forms also occur. From Sicily during the Norman period we have possibly the earliest surviving versions of the Easter play *Peregrinus*, as well as a version of the Epiphany play of Herod (*Officium stelle*). More ambitious works are the lengthy *Monte Cassino Passion Play* (mid-twelfth century, with one section in Italian), which is the first known drama on this subject in medieval western Europe; and the *Greater Carmina Burana Passion Play* (c. 1180, with many verses in German), which is now thought to come probably from Bressanone (Brixen) in the south Tirol. Another liturgical development during these two centuries was that the sequence, originally rhythmical prose or prose with some snippets of verse, was standardized as a rhymed verse form. Early verse sequences of Italian authorship are anonymous local additions to an international repertoire—for example, those in the Ravenna graduals of the eleventh century and early twelfth century and in the *Liber ordinarius* of the cathedral of Florence (compiled c. 1180).

Nondramatic literary authors and texts clearly of the earlier twelfth century include the following: a poem on the captivity of Paschal II (*Dum floret verno tempore*, 1111); Archbishop Landulf II of Benevento (d. 1119), who wrote a metrical *Passion* of Saint Mercurius and a narrative sermon for the vigil of the Twelve Brothers; a *Passion* of

saints Flora and Lucilla, in prose and verse, thought to have come from the monastery of that name near Arezzo; Adalbert of Samaria (fl. c. 1113), who was the early master of the *dictamen* or *ars dictaminis* ("art of letter-writing," a practical rhetoric); *Liber Pergaminus*, a laudatory poem on his native city by the grammarian and translator Moses of Bergamo (Mosè de Brolo, Mose del Brolo; d. after 1135, perhaps after 1156); *Liber Maiolichinns* (or *Maiorichinus*), an epic poem celebrating the Pisan expedition against Muslim-ruled Majorca in 1114-1115 and assigned either to the unknown Lawrence of Verona or to a local cleric, Henry of Pisa; Abbot-Bishop Maurice of Catania, who was the author of the *Translation* of Saint Agatha from Constantinople (1126) and probably of the verse epitaph for his predecessor, Abbot-Bishop Ansger; *Carmen de hello Mediolanensium adversus Comenses* or *Liber Cumarum*, a brief epic on the war between Milan and Como written after the destruction of Como in 1127; *Chronieon Vulturnense* (*Chronicle of [San Vincenzo al] Volturno*, 1124-1130) by the monk John; Abbot Peter II of Santissima Trinita at Venosa, who wrote *Vitae quatuor priorum abbatum Cavensium* (*Lives of the First Four Abbots of La Cava*, c. 1140, formerly assigned to his predecessor Hugh of Venosa); the hagiographer Atto of Pistoia (d. 1153); and the historians Alexander of Telesse (d. before 1143) and Falco of Benevento (c. 1072-c. 1144).

The Genoese chronicler Caffaro (1080 or 1081-1166) and the Cassinese hagiographer and chronicler Peter the Deacon (c. 1107—c. 1158) were active well into the mid-twelfth century. *Graphia aureae urbis Romae* (*Writing of the Golden City of Rome*) has been ascribed to Peter the Deacon; this work is a classicizing revision of the inventive guidebook *Mirabilia urbis Romae* (*Marvels of the City of Rome*, before 1144) in one of its early versions. The following are from the mid-twelfth century and a little beyond: Benincasa's *Life* of Saint Rayner of Pisa (c. 1160-1164, in very vernacular Latin); a rewritten *Life* of Saint Bassian of Lodi (c. 1163, in origin probably a tenth-century text); the rhythmical *L'lanctus Evandri de morte Pallantis* (*Encinder's Lament for the Death of I'alias*, undated and perhaps earlier than 1163), which was based on an event in Virgil's *Aeneid*, a poem on the translation of Saint Bartholomew from Benevento to Rome (*Militis alma Dei translatio Bartholomaei*, c. 1157-c. 1170); two poems arising from Frederick I Barbarossa's campaigns in Lombardy (the dialogue *De destructione*

civitatis Mediolanensis lamenting his punitive devastation of Milan in 1162, and the proimperial epic *Carmen de gestis Frederici I. imperatoris in Lombardia*, thought to have been written between 1162 and 1166); a history of contemporary Lodi by Otto and Acerbus Morena and their anonymous continuator (1153-1168); the papal historian and biographer Boso (d. after 1177); John Berard, the chronicler of San Clemente di Casauria (fl. c. 1175—c. 1180); Romuald Guarna (Romuald of Salerno; d. 1181), the putative author of medieval Italy's first universal chronicle; and the Sicilian historian Hugo Falcandus (fl. c. 1170—c. 1190).

Figures and works from the final decades of the twelfth century include: the poets Godfrey of Viterbo (c. 1125—after 1202) and Henry of Settimello (fl. 1193); a metrical fable collection, *Avianus Venetus* (*Avianus of Venice*); the Bolognese master Geoffrey (Gaufredus; sometimes identified with the Englishman Geoffrey of Vinsauf), whose dictaminal treatise *Summa de arte dictandi* is enlivened by sections in first-rate quantitative verse; *De Ierosolima a Saladino capta* (*On Jerusalem Taken by Saladin*), a poem associated with the abbey of Nonantola that recounts events of the Third Crusade; a variously titled longer work chiefly on the siege of Acre (1189-1191) during the Third Crusade, ascribed to a Florentine named Monachus who was later the Latin patriarch of Jerusalem; a rhythmical "hymn" on the victory of the Brescians at the battle of Rudiano (1191); the monk Alexander's chronicle of San Bartolomeo di Carpineto (finished 1194/95); the theologian and mystic Joachim of Fiore (c. 1135-1202); and Enverard of Verona, known for the introductory sections of his otherwise rather dull *Liber de divisionibus paludis comunis Verone* (*Book on the Divisions of the Marshland of the Commune of Verona*, 1199).

There were a number of essentially twelfth-century writers whose literary activity probably or certainly extended into the thirteenth century. They include the following: the poet Peter of Eboli (d. 1219 or 1220); the theologian Lothar of the Conti of Segni (later Pope Innocent III, 1160 or 1161-1216); the jurist and bishop Bernard of Pavia (d. 1213), who wrote a *Life* of his sainted predecessor in that see, Bishop Lanfranc (d. 1198); the grammarian, lexicographer, and theologian Uguccione of Pisa (Hugutio, d. 1210); and the Cistercian spiritual writer Oglerio or Ogerio of Trino (or of Lucedio, c. 1136—1214). Parts of Oglerio's *De laudibus sanctae Dei genetricis* (*On the Praises of the Holy Mother of*

God) were soon attributed to Bernard of Clairvaux and circulated with Bernard's works under the title *Planctus Mariae* (*Mary's Lament*). A number of hagiographic texts from Sardinia are also eleventh- or twelfth-century, though their precise dating remains elusive. Of particular note are a *Life* of Saint George of Suelli (twelfth century), the poem *Christe patris verbum qui regnum rite supernum* in honor of Saint Saturnus (Saturninus) of Cagliari, and the *Passion* of Saint Antiochus of the Sulcis in prose and verse.

During the thirteenth and fourteenth centuries in Italy, more people than ever before were literate in Latin; accordingly, there were numerous significant authors who wrote in Latin. Major contributions were made by members of the new mendicant orders. Liturgical compilations of this period (and later) preserve a considerable quantity of anonymous religious poetry of Italian origin, some of it antedating the thirteenth century. The sequence underwent further development and was no longer exclusively liturgical in application. For the first time since antiquity, there were a substantial number of laypeople, especially judges, among Italy's Latin writers. There was a tendency toward works of great length, sometimes encyclopedic. The scholastics' drier, more "scientific" style of argumentation made great inroads into such traditionally literary forms as the treatise and the sermon,

With the thirteenth century came an outpouring of important spiritual literature in which Franciscans were especially prominent. To Francis of Assisi (1181 or 1182-1226) are ascribed a few rhythmical poems and other Latin writings with genuine poetic flavor. Clare of Assisi (1193 or 1394—1253) is considered the author of four Latin letters of somewhat similar quality, but just how far secretaries may have had a hand in shaping these is not easy to determine. Thomas of Celano (c. 1190-1260) wrote two *Lives* of Francis and *Miracles of the Blessed Francis*. The great sequence *Dies irae* is also conventionally assigned to Thomas. Another sequence, *Stabat mater*, has often been attributed to the Franciscan Jacopone of Todi (c. 1230-1306), who is better known today as a poet in Italian. However, both attributions are suspect: the poems are of unknown provenance, and each seems earlier than its supposed author. The theologians Bonaventure (c. 1217-1274), also a Franciscan, and Thomas Aquinas (1224-1274), a Dominican, spent much of their lives outside Italy; they either certainly (Bonaventure) or very

probably (Thomas) wrote distinguished religious verse. Bonaventure's literary talent is also clear in prose writings such as his *Journey of the Mind to God* and his two official *Legends* of Francis. (The term *legenda*, often used in titles, means "profitable reading matter.")

Other instances of thirteenth-century spiritual writing, broadly defined, are as follows: the devotional poetry of the Benedictine abbot Gregory of Monte Sacro (c. 1190-c. 1245), who was also the author of a major encyclopedic poem; the sermons of Anthony of Padua, the second major Franciscan saint (who was born and trained in Portugal and was active in Italy 1222-1224, c. 1227—1231); the first *Life* (*Legenda 'Assidua'*) of Anthony, written at Padua in 1232 or shortly afterward; the anonymous dialogue *Sacred Exchange between Saint Francis and Lady Poverty* (of uncertain date and perhaps not of Italian origin, though it has usually been thought so); the rhymed offices for Saint Geminian of Modena and for the Translation of Saint Agatha to Catania (also undated); the bull of canonization for Clare (1255); the hymns in honor of Clare ascribed to Pope Alexander IV (Rinaldo of the Conti of Segni, d. 1261); a prose *Legend* of Clare commissioned by Alexander (this is often ascribed to Thomas of Celano); a closely contemporary *Legend* of Clare in verse; the visionary epic *Anticerberus* of the Franciscan Bongiovanni of Cavriana (11. c. 1240); the ascetic poem *De recte vivendi doctrina* (*Doctrine of Correct Living*); the hagiographic collections of the Dominican Bartholomew of Trent (died c. 1250 or 1255); the *Golden Legend* and the sermons of the Dominican Jacobus da Voragine (James of Varazze, Jacopo da Varagine, c. 1226-1298); an Augustinian *Life* (c. 1257) of Bona of Pisa; *Stimulus amoris* (*Prick of Love*) by the Franciscan Jacopo da Milano (James of Milan, late thirteenth century); the *Liber officiorum* (*Book of Offices*) of the Milanese hymnographer Origo Scaccabarozzi (d. 1293, Franciscan); and the *Sermons* of the Vallombrosan abbot and mystic Humility of Faenza (c. 1226-1310).

Among thirteenth-century poets on secular subjects are two writers of elegiac comedy: Richard of Venosa (fl. 1228-1229) and James of Benevento (mid-thirteenth century). James was also the author of a didactic poem, *Carmina moralia* (*Moral Verses*). His Milanese contemporary Ardighino (Bellino) Bissolo left three such edifying productions. Another moralizing work is the fable collection *Novus*

Esopus (New Aesop) by an otherwise unknown Baldo. Probably also from this century, but not certainly Italian, is an early version (in some 300 lines) of a well known medical poem, *Regimen sanitatis Salerni* (Salerno's Rule of Health). Historical and civic poets include Quilichino of Spoleto (fl. 1236-1237), Urso of Genoa (fl. 1225-1245), Orfino of Lodi (c. 1195-c. 1251), Eustace of Matera (fl. 1270), Boniface of Verona (d. after 1293), and Stefanardo of Vimercate (d. 1297). The work of the occasional poet Bonaiuto of Casentino (fl. 1292-1300) is varied.

The following are notable instances of rhythmical verse for secular ends: *De colloquio celebrato ab imperatore cum Cremonensibus et Parmensibus et Papiensibus in loco Burgt Sancti Dompnini* (305 lines), on Frederick II's northern Italian campaign of 1226, transmitted in the *Annates Placentini* (CAnnals of Piacenza) of Giovanni Codagnello (died c. 1235); longer poems by Gerardo Maurisio of Vicenza and the notary Thadeus in Gerardo's chronicle of the brothers Ezzelino and Alberico da Romano (c. 1237); three so-called *Carmina triumphalia* celebrating Parma's destruction of the newly founded city of Victoria (1248); *Carmen de Ambrosio grarnmatico*, a colleague's extended lament for a Bolognese schoolmaster (after 1248); and Morando of Padua's jocular *Vinum dulce gloriosutn* praising wine and excommunicating water (c. mid-thirteenth century).

Formal Latin prose composition in medieval Italy reached a zenith during the thirteenth century. The following figures were prominent in this regard: the imperial protonotary Pier della Vigna (Petrus de Vineia, c. 1190-1249); his less famous contemporaries Terrisio of Atina (like many *dictatores*, also a poet in rhythmical verse) and Nicholas of Rocca (d. after 1256), who were both professors at the newly founded University of Naples; and the papal diplomat, dictaminal writer, epistolographer, and religious poet Thomas of Capua (d. 1239). Significant examples of works by others include the following: model speeches in a manual on city governance, *Oculuspastoralis* (*The Shepherd's Eye*, c. 1222-c. 1239); an epistolary contest (1260) between the papal notaries Jordan of Terracina and John of Capua; *Cronica in factis et circa facta Marchie Trivixane* (*Chronicles on and about the Doings of the Trevisan March*), by Rolandino of Padua (1200-1276), which is laden with letters and speeches; a revised version (between 1266 and 1293) of Matthew of Amalfi's early thirteenth-century

Translation of Saint Andrew from Constantinople; and a highly oratorical account by Thadeus of Naples, written at Messina in 1291, of the fall of the crusader capital Acre in the same year. Four major dictaminal writers who spent at least part of their careers at the University of Bologna (the leading center for the study of *ars dictaminis*) were Boncompagno of Signa (c. 1170–c. 1241), also the author of a history of the siege of Ancona in 1173; Bene of Florence (d. before 1242); Guido Faba (c. 1190–c. 1250); and Bono of Lucca (d. 1279). The Fleming James of Dinant composed his *Ars arengandi* (*Art of Preaching*) and a series of dictaminal works while he was active in Italy from c. 1280 to c. 1300.

Other thirteenth-century prose writers include: the southern historians Niccolò Jamsilla (or the author of the history that goes under this name, d. after 1258), Bartholomew of Neocastro (d. 1294 or 1295), and Saba Malaspina (d. 1297 or 1298); the chroniclers Tolosano of Faenza (d. 1226), Richard of San Germano (d. 1243 or 1244), and Salimbene of Parma (Salim-bene de Adam, b. 1221); the unknown author of the papal biography *Gesta Innocentii III* (fl. c. 1209–1215); the moralist Albertano of Brescia (d. after 1253); the eulogist Nicholas of Bari (fl. c. 1231 – 1248); the early ethnographer of the Mongols, John of Piano Carpini (d. 1252); the moralizing biographer of emperors and popes, Thomas of Pavia (died c. 1280); and the grammarian and lexicographer Giovanni Balbi (John of Genoa, d. 1298). Sometime between 1230 and 1255 William of Padua wrote, for the abbot of Lagrasse in southern France, *Gesta Karoli Magni ad Carcassonam et Narbonam* (*Deeds of Charlemagne at Carcassonne and Narbonne*), in which an account of the founding of his abbey is encompassed in a narrative history drawn from the material of vernacular epics. In 1287 Guido delle Colonne (c. 1215–c. 1290, called Guido de Columnis by those who doubt that he was the vernacular poet of this name) finished his long and influential *Historia destructionis Troiae* (*History of the Destruction of Troy*), which drew on a well-known French romance. In 1300 or slightly earlier, the preacher Jacopo de Cessolis (James of Cessole, d. after 1321) completed *Libellus de moribus hominum et officiis nobilium ac popularium super ludo scacborum*, a moral allegory organized around the game of chess that came to be widely read.

Works and writers spanning the thirteenth and fourteenth centuries

include the following: Bonvesin de la Riva (c. 1245-c. 1314), a vernacular poet whose best-known works in Latin are a eulogistic prose account of Milan (his home city), *De magnalibus Mediolani* (1288), and a didactic poem, *De vita scholastica* (*On Scholastic Life*, shortly after 1303); the *Book of Angela of Foligno*, consisting of Arnaldo of Foligno's *Memorial* of Angela—completed in 1296—and other texts added after her death in 1309; Giunta Bevegnati's *Legend* of Margaret of Cortona (d. 1297), completed in 1311; and the *Opus metricum* of Cardinal Jacopo Stefaneschi (c. 1260-1341), a long hexameter poem on popes Celestine V and Boniface VIII begun in the early 1290s and finished in 1315. Roughly contemporary are the great majority of the thirty-five or thirty-six Latin poems transmitted along with the Italian verse of "Anonimo Genovese" ("Anonymous of Genoa," late thirteenth century—early fourteenth century). Most of these would seem to be "Anonimo's" own work, although one is a lyric usually assigned to the Frenchman Philip the Chancellor (d. 1226) and another is also attested to elsewhere.

From the late thirteenth century (perhaps) and the earlier fourteenth century come sequences using or adapting the *ballata* rhyme scheme. These pieces often are called Latin *laude*, but their relationship to the Italian *lauda* is tenuous. The best-known are the thirteen songs for the nativity or for the Virgin recorded in a fourteenth-century antiphonary from Bobbio. One of these, *Vernans rosa*, is better preserved elsewhere and has been thought to be central Italian in origin; another, *Missus baiulus*, is notably dramatic. An important tradition of liturgical drama is represented by offices from Padua for the Annunciation and the Purification (later thirteenth century) and—from Cividale and from Aquileia or its vicinity—by an office for the Annunciation, a long *Planctus Mariae*, and the longest version of the widely disseminated lament *Flete, fideles anime* (fourteenth century). Also from the fourteenth century is *Officium quarti militis* (*Office of the Fourth Soldier*), the surviving portion of an elaborate drama from Sulmona on the Passion and the Resurrection,

The literature of the early fourteenth century resembles that of the thirteenth century in many ways. In 1303 and 1304, dictaminal manuals were written by Giovanni di Bonandrea (d. 1321) at Bologna and by Bichilino of Spello at Padua. In 1305, the Spiritual Franciscan Ubertino of Casale (d. after 1335) put together his partly apocalyptic *Arbor vite*

crucifixe Jesu (*Tree of Life of the Crucified Jesus*), a theological and political work with literary passages. Between 1304 and 1309, Pietro Crescenzi (died c. 1320) finished his *Liber ruralium commodorum* (*Book of Rural Goods*), a comprehensive agricultural handbook notable for the understated artistry of its expository prose. Dante Alighieri (1265–1321) was mainly a vernacular poet, but during the first two decades of the fourteenth century he wrote Latin treatises and prose letters in established styles. From at least 1311 to at least 1320, Giovanni de Matociis (John the Mansionary, d. after 1336) wrote biographical histories of the early popes and of the Roman emperors down to Louis the Pious. From 1318 to 1323, William of Tocco drafted and then revised a biography of Thomas Aquinas commissioned in support of Thomas's canonization. In 1330, William of Solagna gave written form to an oral account by the Franciscan missionary Odoric of Pordenone of his journeys in the Middle East and the Far East. The papal scriptor (scribe) Opicino de Canistris (1296–c. 1351), in exile at Avignon, wrote a well-regarded description of his home city of Pavia; Opicino was also the author of curious and sometimes marginally literary private texts and drawings. Between 1327 and 1340, an anonymous Celestinian recast earlier, more prosaic, but also more immediate, lives of Celestine V into a prose and verse biography of studied elegance and possibly broader geographic appeal.

In 1334, James of Acqui was writing his *Chronicon imaginis mundi*, a universal chronicle known both as the earliest surviving biography of the traveler Marco Polo and as a reworking of folkloric and other legendary material. Someone—probably Petrarch's teacher Convevole of Prato—composed a largely poetical miscellany, the so-called *Regia carmina* (*Royal Verses*), between perhaps 1320 and early 1338, but suspended work during most of the papacy of John XXII (1316–1334); *Regia carmina* was dedicated to the lord of Prato, Robert of Anjou, king of mainland Sicily. Between 1337 and 1340, Nicolò Speciale (Speziale, d. before 1343) produced a long history of insular Sicily from the Sicilian Vespers to the death of Frederick III. In 1340, Duccio (di Amadore) of Prato completed his *Cincturale*, a poem in 423 elegiac distichs celebrating a local relic, the "belt of the blessed Virgin"; and Boncore of Santa Vittoria finished his *Novus liber hymnorum ac orationum*, a versatile but pedestrian array of nonliturgical hymns (including a

noteworthy amplification of the *Dies irae*) and other poems in hymnic measures that he had written, or in some cases collected, as a cleric at Saint Peter's in Rome. From 1338 until shortly before his death in 1348, Simone Fidati (Simon of Cascia) composed his monumental *De gestis Domini Salvatoris*, a fifteen-book life of Christ replete with gospel commentary; Simone was also the author of Latin sermons and of other writings in Latin and Italian. Chronicle histories of differing literary character were written by Guglielmo Cortusi (c. 1285-after 1360) and by Dominic of Gravina (c. 1310-after 1350). Some of the letters of the Roman tribune Cola di Rienzo (d. 1354) have literary merit.

A concurrent development was the literature of humanism, a body of writing noted for its increasingly meticulous adoption of closely observed ancient literary forms and classical modes of Latin expression, coupled with a more general interest in aspects of antiquity. Its earliest phase, which goes back to the Paduan judge and poet Lovato Lovati (c. 1240-1309), begins with stylistically classicizing verse by writers of traditional prose. Typical in this respect are Pace of Ferrara (fl. 1299-1304) and Giovanni del Virgilio (d. after 1325), who were poets and commentators on Latin school authors. Together with Dante, Giovanni also revived the bucolic eclogue in hexameters, a literary form not known to have been practiced in Italy since the first century. Two early humanists who were considered important in their time but whose works have since largely perished are the poet Benvenuto Campesani of Vicenza (c. 1253-1323) and the epistolographer and satirist Geri of Arezzo (c. 1270-after 1339). The *Compendium moralium notabilium* (*Précis of Things Morally Noteworthy*) of Jeremy of Montagnone (d. 1320 or 1321), a collection of excerpts, marked a major step in literary history; it is stylistically unremarkable, but it distinguishes systematically between ancient and medieval authors, and Jeremy, like many humanists, focused on literature as a vehicle of moral and ethical authority.

The *Ecerinis* of the poet and literary theorist Albertino Mussato (1261-1329), the preeminent second-generation humanist, attempts both the meters and the manner of Senecan tragedy. Albertino's several histories use a Latin prose modeled on classical style. Such prose was also written, in one fashion or another, by the historian and poet Ferreto Ferreti (d. 1337), the orator and papal secretary Zanobi of Strada

(c. 1312-1361), and the papal scriptor and Roman antiquary Giovanni Cavallini (d. 1349). Other early manifestations of this movement are the grammatical writings of Bartholomew of San Concordio (the Dominican Bartholomew of Pisa, d. 1347), who preferred classical orthography; and the historical poems in epic verse by Castellano of Bassano (d. after 1332), James of Piacenza (died c. 1349), and Ranieri Granchi (Raynerius de Grancis, d. after 1356).

The most prolific fourteenth-century humanist was Petrarch (Francesco Petrarca, 1304-1374), who in a vast body of Latin texts attempted, with varying success, to write like the ancients; an emphasis on moral reform accompanies this stylistic choice. Especially noteworthy are his collection of brief dialogues *Remedies for Fortune Good Mid Bad*, the consolatory dialogue *Secretum*, the *Book without Name* (a collection of scathing letters on life at the papal court in Avignon), and an extensive personal correspondence both in prose and in verse. Also important are his unfinished epic poem *Africa* (on the exploits of the ancient Roman conqueror of Carthage, Scipio Africanus) and his Latin eclogues; his early comedy *Philostratus's Philology* is lost. Giovanni Boccaccio (1313-1375) wrote classicizing poems and prose letters in Latin. But his chief accomplishments in this literature lie in the learned treatise *Genealogy of the Pagan Gods*, with its defense of poetry; and in the morally attuned biographical collections *On the Fates of Famous Men* and *On Famous Women*.

Younger humanist contemporaries of Petrarch and Boccaccio include the following: Antonio de Gaio or del Gaio of Legnago (c. 1350–1384), who was an epistolographer and the author of brief biographical portraits; the musician and poet Francesco Landini (c. 1325–1397), who delended Ockham's logic; the historian and literary commentator Benvenuto of Imola (d. 1387 or 1388); the poet and literary commentator Peter of Moglio (Pietro della Retorica, d. 1383); the poets Moggio Moggi (c. 1330-after 1388), Domenico Silvestri (born c. 1335), and Giovanni Quatrario (1336–1402); the Florentine chancellor, epistolographer, and mythographer Coluccio Salutati (1331-1406); and the epistolographer and moralist Giovanni Conversini of Ravenna (1343-1408). Provisionally, *Carmen medicate* (*Medical Poem*, some 240 hexameters with a prefatory prose letter) may be placed in this period. It is supposedly by one Crispus, who is otherwise unknown and may be

fictitious; at one time he was incorrectly identified with an eighth-century archbishop of Milan. Though the issues of its date and tone have not been fully resolved, *Carmen medicale* could be, as has been argued, a fourteenth-century parody drawing on ancient and medieval collections of remedies in verse.

The now widespread literary use of Italian and the onset of the new, philologically informed humanism together heralded the demise of older, typically medieval styles of Latin literature. For a while, though, these older styles retained their vitality, particularly in the religious orders. The very popular and influential manual *Meditations on the Life of Christ*, ascribed to the Franciscan John (Johannes) de Caulibus, is now thought to have been written sometime between the mid-1340s and the mid-1360s. In 1360 the Augustinian Bono Stoppani of Como finished his collection of prose fables moralized for preaching, *Fabule rnistice declarate*. From at least 1353 to at least 1361, Michael of Piazza (who is thought to have been a Franciscan) was writing an oratorically colored chronicle of mid-century insular Sicily. In 1366 the Dominican Raymond of Capua (Raimundus de Vineis, c. 1330-1399) completed his *Legend* of Agnes of Montepulciano. Although a relatively recent attempt to credit Raymond with the sequence *Vernans rosa* is unpersuasive, he was the author of a very traditionally crafted office for the Visitation of the Blessed Virgin. His masterwork, the *Legend* of Catherine of Siena, was finished in 1395. The Franciscan Bartholomew of Pisa (Bartolomeo da Rinonico, died c. 1401) is famous for his *Conformity of the Life of the Blessed Francis to the Life of the Lord Jesus*, composed between c. 1385 and 1390 and often called the *Book of Conformities*. Bartholomew was active as early as the 1370s; his other surviving work includes two collections of sermons and a *Life of the Blessed Virgin Mary*, the latter completed in 1382. Not until the fifteenth century would humanistic Latin challenge established practices in liturgical poetry, homiletics, and spiritual biography.

Lauda

The *lauda* (plural, *laude*)—also spelled *laude* (plural, *laudi*)—is a canticle or hymn of praise. Either a musical-literary or a purely literary form, the *lauda* is a nonliturgical devotional song, usually in praise of the Virgin Mary, Christ, or the saints, although in the Renaissance, *laude* with secular themes were also composed. Etymologically, the term *lauda* is believed to have derived from the praise psalms in the Vulgate, which are replete with variants of the verb *laudare* ("to praise").

The prehistory of the *lauda* is controversial, with experts having diverse agendas, and thus offering different interpretations. It is likely,

however, that originally the *lauda* was a paraliturgical rhythm (*ritmo*) in Latin. Still, the most famous *lande* were written in the Italian vernacular, primarily by persons whose identities are unknown. The medieval *lauda* functioned either as a sung prayer (of joy or penance) or as a sung homily. The early, complex history of the *lauda* is closely linked to the growth of lay religious practice.

Some scholars consider the most illustrious vernacular *lauda* to be *Laudes creaturarum* ("Praises of God's Creatures"), also known as *Cantico delle creature* ("Canticle of the Creatures") or *Cantico del Frate Sole* ("Canticle of Brother Sun"), composed in 1224 or 1225 by Saint Francis of Assisi (1182–1226). The *Cantico*, a simple but profoundly moving hymn of praise written in the Umbrian dialect, thanks God for, or through, all elements of creation, which Francis refers to as members of his family. Thus, Francis praises God for Brother Sun, Sister Moon, Brother Wind, Sister Water, Brother Fire, Mother Earth, and—significantly—Sister Earthly Death, *da la quale nulla homo vivente po scappare* ("from which no living person can escape"). Francis wrote his hymn of praise in assonanced verse, which calls to mind the performance of liturgical chants.

An episode that took place in 1233 greatly influenced the evolution of the vernacular *lauda*. The chronicles of Salimbene and Riccardo da San Germano tell us that during this so-called "year of the hallelujah" (*anno dell'alleluia*) the Franciscans and their fellow mendicants, the Dominicans, led great processions of psalm singers along the highways of Umbria. The official purpose of these marches was to call for peace between the Guelfs and the Ghibellines, and between the Lombard communes and the Hohenstaufen emperor Frederick II. As the demonstrators marched, they intoned *laude* in the Umbrian dialect, some of whose words have been recorded in the above-mentioned chronicles.

Inspired by this unprecedented display of religious ardor, men and women organized lay confraternities, which subsequently spread like wildfire, first through Umbria and then beyond. The purpose of these companies was to draw the laity back to orthodoxy and away from heretically-leaning movements. One important confraternity that was created in 1233, as a direct outgrowth of the participation of its members in the religious marches of that year, was the Florentine Servi

or *Serviti della Beata Vergine* (Servants of Mary). During these years, the *lauda* repertoire was irregular in form and related thematically to Marian devotion. The confraternities themselves existed in a preinstitutional form, functioning on the streets in an ad hoc manner.

The year 1260 marks another critical moment in the history of the *lauda*. Joachim of Fiore had promoted the belief that this year marked the end of the world and the coming of the empire or kingdom of the Holy Spirit. In 1258, the friar and mystic Ranieri Fasani—motivated by this belief, which was shared by many—left his remote hermitage and came to Perugia to help its citizens prepare for the last judgment. To this end, Fasani founded the confraternity of *Disciplinati di Gesù Cristo* and begged his fellow Christians—men, women, and children—to glorify God publicly through song, to repent, and to purge themselves of sin through weeping and self-flagellation. Other hermits joined Fasani in leading processions of flagellants, and soon the roads and towns of Umbria, and subsequently those of contiguous regions, were reverberating with the laments of the *disciplinati* (also called *flagellanti* or *battuti*). The flagellant movement soon spread to other parts of Italy and beyond—to Provence, Burgundy, Germany, and Poland.

In the wake of this movement, more confraternities of *disciplinati* were formed; in Perugia alone perhaps more than forty existed during this period. The salient point with regard to the development of the *lauda* is that around 1267 the *disciplinati* began to accompany their self-flagellation with, in Salimbene's words, *laudes divinas ad honorern Dei et beatae Marine Virginis*—i.e., the chanting of songs of praise to God and the Madonna. Later, the *laude* of the *disciplinati*—whose primary purpose was to imitate the suffering of Christ—also focused on darker themes, such as earthly evils, penance, disease, dying, and death.

Another type of lay confraternity, the *laudese* (plural, *laudesi*), also came into existence after 1260. The *laudesi* were confraternities of deeply religious men (and sometimes women) who sought to express their piety by assisting at mass (sometimes on a daily basis) and through confession, good works, and the singing of *laude*. The themes of their *laude* are praises of Mary, Christ, and the saints. Many *laudesi* were formed primarily between 1270 and 1290 in Florence, one of the largest and richest cities of Europe. The influential presence in Florence of the mendicant friars (both Dominicans and Franciscans) also

stimulated the growth of these companies.

The *laudesi* and the *disciplinati* were either newly formed or derived from previously existing Marian companies. Although both the *laudesi* and the *disciplinati* were institutions that grew out of mendicant spirituality, the *laudesi* focused primarily on praise and the *disciplinati* focused primarily on penance. Another distinction between the *laudesi* and the *disciplinati* is that the actions of the *laudesi* tended to be public, whereas the meetings of the *disciplinati*, in keeping with their penitential purpose, were held mostly in private. Additionally, the members of the *disciplinati* tended to be upper-class males, whereas the membership of the *laudesi* was more heterogeneous and included people of the mercantile and lower classes.

Apparently, at this point in the history of the *lauda*, the form of the secular ballad was adopted for what the contemporary chronicler Salimbene called *laudes divinas ad honorem Dei et beatae Mariae Virginis*. The stanza was sung by a soloist or group and the refrain by a chorus. By adopting the secular ballad form, the religious *lauda* actively—and successfully—competed with its secular counterpart for the attention of the public.

The two ballad forms that were adopted in this period were the *ballata maggiore*, which consisted of seven- and eight-syllable lines (*settenari* and *ottonari*), alternating with hendecasyllables (the rhyme scheme of the refrain being abbx and that of the strophe ababbccx); and the *zagialesca* strophe of ancient Hispano-Arabic origin, which consisted of a quatrain having the same rhyme throughout—i.e., aaax, bbbx, etc. The *ballata maggiore* form of the vernacular *lauda* may have been introduced by Guittone d'Arezzo (c. 1230-1294). Although Guittone wrote complex and abstruse love poetry in his youth, later in life he joined the Cavalieri di Santa Maria (Knights of Blessed Mary) or Frati Gaudenti ("jovial friars"). At this point he began to compose religious *laude* in the vernacular, which were more successful than his secular poetry. The *zagialesca* form of the *lauda* may have been introduced by a certain Garzo or by the early Franciscan mystic and poet Jacopone da Todi. Garzo is identified with the notary Garzo dell'Incisa di Valdarno, the paternal great-grandfather of Petrarch (Francesco Petrarca, 1304-1374); four of Garzo's *laude* are preserved in the famous collection of *laude* known as *Laudario cortonese*, which

dates from approximately 1270-1280.

Of the known writers of vernacular *laude*, Jacopone da Todi (Jacopo dei Benedetti, c. 1230-1306) is the most famous and most prolific. His *laudario*—which is personal and intended for the use of the order, not collective and for the use of the confraternities—consists of more than 100 highly emotional poems of great power and originality, written in the Umbrian dialect. They express tremendously contrasting subjects and moods: vehement asceticism and self-humiliation, enraged criticism of other sinners, embittered satire, and mystical ecstasy. Jacopone's most important *laude* are *O iubelo del core*; *Senno me par e cortesia*; *Povertade ennamorata*; *Plange la Chesia, plange e dolora*; *0 femmene, guardate a le mortal'ferute*; *Quefarai, Pier dalMorrone?*; *Que farai, fra Iacovone?*; *O papa Bonijazio*; *Quando t'aliegre, omo d'altura*; *Donna de Paradiso*; *Omo, mittete a pensare*-, *Frate Ranaldo, do' si' andato?*; and *Sopr'onne lengtia Amore*. Jacopone is also the reputed author of the Latin sequence *Stabat mater dolorosa*.

In sum, more than 200 *laudari*—collections of *laude*—have preserved many individual *laude*, the majority of which are anonymous. For the most part, these collections are organized according to the liturgical calendar (i.e., the calendar of proper feast days) and date from a fairly late period in the tradition. The oldest *laudari* come from Perugia, Assisi, Arezzo, Borgo San Sepolcro, Gubbio, and Fabriano. Two *laudari* are unique in that they preserve the musical notation: the thirteenth-century Cortona *laudari* (Cortona, Biblioteca del Comune; MS 91), discovered in 1876; and the fourteenth-century codex Magiabechiana (Mgl), Florence, Biblioteca Nazionale Centrale, manuscript II I 122 (Banco Rati 18). In both manuscripts the music is monophonic and closely linked to the syllabic stress of the text. Some of the most important *laude* in the Cortona collection are *Venite a laudare*; *Ave, Vergene gaudente*; *Alta Trinità beata*; *Oimè lasso e freddo lo mio core*-, *Chi vol lo rnondo d&prezzare*, and *Amor dolze senza pare*.

Another important aspect of the *laudari* is the fact that they document the evolution of the *lauda* from a lyric to a dramatic genre. The dramatic *lauda* contains monologues or dialogues among a number of characters and is the nucleus of the Italian miracle or mystery play, the *sacra rappresentazione*. The most famous example of the dramatic *lauda* is Jacopone da Todi's *Donna de Paradiso* ("Lady of Paradise"), also

referred to as *Pianto della Madonna* ("Lament of the Madonna"), which relates in touchingly simple language the passion of Christ. This *lauda* consists entirely of dialogue, with no descriptive or narrative discourse. The dramatic *laude* were presented first in churches, then in porticos, and finally outdoors in city squares, with or without elementary sets. Typical themes were episodes from the gospels, the last judgment, saints' lives, and so on; the aim of the dramatic *lauda* was to educate a largely illiterate public in these aspects of the faith.

The *lauda* continued to flourish in the fourteenth century in the hands of such authors as Ugo Panziera da Prato (1265-1330), Bianco di Sand da Siena (c. 1350-1410), and Giovanni Dominici (c. 1357-1419). The genre thrived again in the fifteenth century, and it was during this period that the polyphonic *lauda* developed. Nevertheless, during the fifteenth century the prevalent form was the literary *lauda*, written by professional men of letters such as Feo Belcari (1410-1484), Girolamo Benivieni (1453-1542), Lorenzo dei Medici (1449-1492), and Leonardo Giustinian (1388-1446). In their *laude*, these authors characteristically used the *ottava rima* of the chivalrous epic popular at the time to treat ancient subjects in a folkloristic manner, also introducing fantastic or realistic elements. The poems of the fiery religious reformer and Dominican friar Girolamo Savonarola (1452-1498) were very different; they seem to have been inspired by an authentic *furor divinus*, although they conformed stylistically to the Belcarian model. Musically, the *lauda* of the sixteenth century represents an important step in the development of the oratorio. The *laudari* of the secular Congregazione dell'Oratorio, founded by Saint Philip Neri (d. 1595), have fortunately survived. The *lauda* remained an important element of Italian devotional life until the nineteenth century.

Law: Canon

Canon law is the legal system developed by the medieval Christian church and still maintained in some branches of the Christian tradition today. The term "canon" stems from a Greek root meaning "rule" or "measure" and was used from a very early period to describe the rules and regulations of the Christian community. The canons covered a broad range of topics: e.g., they detailed the rights and obligations of clerics, monks, and laypeople; prescribed the proper conduct of liturgical observances; regulated morality and personal conduct; established norms for marriage and family life; and dealt with church property and other economic issues.

The canons stemmed from many sources. A few were drawn from the scriptures; others were enacted by church councils—especially the general or ecumenical councils, which served as legislative bodies for the entire church; and still others were established by local councils and synods, which framed rules for particular regions but whose canons might be adopted elsewhere, outside the place where they originated. The decisions of bishops—particularly the bishops of Rome, who often intervened to resolve disputes in the churches of other bishops—frequently acquired the force of law and were treated as authoritative precedents in determining similar cases.

Early Medieval Canon Law

Since the sources of canon law were so numerous and so varied, from an early period bishops and other church authorities who faced concrete problems or disputes turned for guidance to collections of

canons drawn up for that purpose. The earliest such collection, *Didache*, or *Doctrina duodecim Apostolorum*, dates from the late first century or the early second century. This brief collection of moral precepts, liturgical rules, and regulations for the conduct of church business was soon followed by numerous other collections, such as *Didascalia apostolorum* and the *Apostolic Tradition* ascribed to Hippolytus of Rome, which supplemented and amplified earlier prescriptions.

Among the numerous collections of canonical rules from the fifth and sixth centuries, the church in Gaul produced *Statuta ecclesiae antiqua* and the Aries Collection; Spain yielded a set of canons that constituted the core of the somewhat later collection known as *Hispana*; and in Italy the Scythian monk Dionysius Exiguus (fl. c. 497-526) compiled the set of canons known as *Dionysiana*, perhaps at the command, and probably with the encouragement, of the papacy. *Dionysiana* became the nucleus of several later canonical collections, the most influential of which was *Collectio Dionysio-Hadriana*, which Pope Hadrian I sent to Charlemagne as an authoritative statement of the canons recognized by the church of Rome.

During the Carolingian period, several collections incorporating forged canons also appeared. The most famous is the *Pseudo-Isidorian Decretals*, produced in northern France in the mid- ninth century. These canons were apparently the work of reformers who hoped to bolster the case for their programs by cloaking them in the guise of letters by early popes and decrees from councils and synods of bygone days. Although a few contemporaries suspected that all was not quite right with these productions, they passed for centuries as authentic, and canonists of later generations often relied on them as guides to the discipline and doctrine of the early church.

Between the late sixth century and the mid-eleventh century, another kind of canonical literature became prominent: the penitentials. These manuals were designed to guide confessors in dealing with moral offenses. Penitentials prescribed the acts of reparation and devotion that their authors deemed suitable both as punishment and as remedies for the sins committed by the penitents who consulted them. The penitentials thus served both a spiritual and a punitive role. As spiritual manuals, they suggested to confessors the kinds of devotional exercises that seemed appropriate for different sins; in their punitive aspect they

were something like sentencing manuals that indicated the punishments merited by various offenses.

Penitentials originated in Ireland, and the earliest was ascribed to Finnian—probably Finnian of Clonard (d. 549), or perhaps Finnian of Moville (d. 579). Other Irish penitentials soon appeared, notably those of Columbanus (d. 615) and Cummean (d. 662). They were followed by further penitentials of Anglo-Saxon origin, such as those of Theodore of Canterbury (c. 602-690), Bede (672 or 673-735), and Egbert of York (d. 766); authors on the continent began to produce similar works somewhat later. Only a few penitentials, notably the Bobbio Penitential and the Penitential of Monte Cassino, originated in Italy, where this type of literature seems not to have been as popular as it became in northern Europe.

Among the dozens of canonical collections that survived from the ninth century, *Collectio Anselmo dedicata*, compiled by a northern Italian cleric toward the end of that century, was particularly influential. The eleventh-century church reform movement stimulated the study of canon law, and reform-minded clerics during the eleventh century produced a flood of new canonical writings. Especially important were the *Decretum* of Bishop Burchard of Worms (written between 1008 and 1012); the *Collection in Five Books*, which circulated widely in Italy; the *Collectio canonum* of Anselm of Lucca (written c. 1083); and Bonizo of Sutri's *Liber de vita Christiana* (which dates from the pontificate of Urban II, 1088–1099). Also during the 1090s, Bishop Ivo of Chartres (c. 1040–1115) compiled further canonical collections; his *Panormia*, a relatively brief, convenient, and well-arranged compendium, became a widely used canonical manual.

Gratian and His Successors

About 1140, a Bolognese canonist named Gratian completed an epoch-making work that he called *Concordia discordantium canonum*, although later generations usually called it *Decretum Gratiani* (*Gratian's Decretum*). Gratian's work soon became the standard textbook of canon law in the western church, and it remained the foundation for the study of canon law among Roman Catholics until

the codification of the law in the twentieth century (the code of Benedict XV appeared in 1917; it was superseded by the code of John Paul II in 1983).

Gratian's book differed from earlier canonical collections in several important ways. It was, for one thing, more comprehensive than its predecessors. Even more important, Gratian not only reproduced the rules enunciated by earlier authorities, but he also analyzed the sources and distinguished carefully between them, so as to resolve their contradictions and differences. Gratian thus provided his readers with rational guidance through the forest of regulations that had accumulated during more than 1,000 years of Christian rule-making and legislation. This made his book an indispensable tool for teaching the law, and it also gave judges and other ecclesiastical officials guidelines for analyzing legal problems, so that they could differentiate between similar situations and find the most appropriate rules to apply to the cases that came before them. Gratian's work also enabled church officials to conduct their business with greater certainty, because his guidelines gave them a reasonable basis for anticipating the legal results of their actions and policies. His book, while far from perfect, gave bishops and other officials, judges, lawyers, and ordinary litigants a more secure starting point than they had previously had for conducting their business and dealing with matters that concerned the institutional church.

The scope of Gratian's work was very broad. He dealt, of course, with the structure and organization of the church itself, and he defined the powers of various church officers and the limits beyond which they could not legally go. He described in considerable detail the rights and obligations of clerics, monks, and nuns in their relations with one another and with the laity. Gratian also dealt with the law concerning church buildings and ecclesiastical revenues, with tithes and other exactions that the church imposed on the faithful, and with the norms for the proper management of the church's property. He devoted some space at the beginning of his work to theoretical questions concerning foundations of law and the relationship of canon law to other categories of law—human, natural, and divine. But the greater part of his book dealt with more immediate and practical issues. Naturally, he gave attention to technical problems of procedure and the limits of the

jurisdiction of courts and officials at various levels of the church's hierarchy. A quite substantial part of Gratian's work dealt with marriage, divorce, and family law—matters of special concern to the laity—while other major sections treated problems related to wills and testaments, war and violence, penance for sins, usury, simony, and criminal offenses, which concerned both laymen and clerics. The concluding section dealt with the sacramental law of the church: times and places for saying mass, conferring holy orders, baptizing children and converts, anointing the sick, and related topics.

The *Decretum Gratiani* quickly became the leading textbook in the schools where canon law was taught, and it contributed substantially to the growth and maturation of canon law as an academic discipline during the second half of the twelfth century. As law teachers composed lectures on the *Decretum* and devised exercises to train the student in the intricacies of applying the law that he learned from Gratian to the problems he would face in real life, they spawned several new genres of legal literature. Systematic commentaries on Gratian's text often took the form of the *Summa decretorum*, of which the earliest example was the one written before 1148 by Paucapalea. This was soon followed by numerous other canonistic *summae*, such as those of Rolandus and Rufinus; the anonymous *Summa Parisiensis*; and above all the great *Summa* of Huguccio (completed c. 1188), which was widely popular. Brief notes on the meaning and application of particular words and phrases in Gratian's text took the form of glosses; and shortly after the beginning of the thirteenth century a German canonist who taught at Bologna, Johannes Teutonicus, compiled a massive gloss apparatus that covered the whole of the *Decretum*. This *Glossa ordinaria*, or standard exposition of Gratian's text, was completed by 1216 and was revised by Bartholomew of Brescia c. 1245. Other academic expositors drilled law students through *quaestiones*—formal debates on legal issues that arose from cases, real or imaginary—and the *quaestio* likewise soon became a standard genre of the rapidly growing legal literature.

Gratian's book not only provided church judges with a firm basis for dealing with all these matters, but it also encouraged litigants to bring their disputes before ecclesiastical courts for resolution. The result was a surge of business in the canonical courts, as well as a need for new

law to deal with contingencies where existing legislation did not apply or where existing remedies seemed unsatisfactory. In consequence, a flood of new rules materialized in the closing decades of the twelfth century and continued during most of the thirteenth century. This in turn vastly enlarged the scope of ecclesiastical jurisdiction and greatly increased the power and importance of canon law.

Some of the new law was the work of general councils, such as the Third Lateran Council (1179), the Fourth Lateran Council (1215), the First Council of Lyon (1245), and the Second Council of Lyon (1274). Much more of the new law, however, originated with the popes and took the form of decretal letters—letters in which the pope enunciated a decision in a particular case and, at the same time, set forth a rule of law applicable to all other cases which were of the same type or in which the same issues arose. Decretals were in some ways rather similar to decisions of the Supreme Court in the legal system of the United States.

Systematic collections of decretals had begun to appear by the closing decades of the twelfth century, and they soon became a subject of academic exposition and analysis in the faculties of canon law. The expositors of the new law are known as decretalists, in contrast to writers on Gratian's book, who were known as decretists. Decretalist writers adapted the literary forms that the decretists had developed to the study of the new law and spawned their own *Summae decretalium*, glosses, and *quaestiones*. In 1230 Pope Gregory IX (r. 1227–1241), who had himself been trained as a canon lawyer, commissioned an eminent Catalan scholar, Raymond of Penyafort (c. 1180 or 1185–1275), to compile a collection of the new law since Gratian's time. In 1234, when Raymond had completed the task, the pope formally published this collection, known as the *Decretals* of Gregory IX, or alternatively as *Liber Extra*, and dispatched a copy to the faculties of canon law at Bologna and Paris, with orders that it be taught as an official lawbook, alongside the work of Gratian.

The *Liber Extra* thus joined Gratian's *Decretum* as one of the two central texts for the training of canon lawyers. Like the *Decretum*, the *Liber Extra* also became a subject of glosses, lectures, *summae*, *quaestiones*, and commentaries of various kinds that academic canonists produced as a by-product of their teaching.

The making of new law did not cease with the publication of *Liber Extra*. Popes continued to issue decretals, councils continued to adopt legislation, and canonists continued to compile unofficial collections of new laws to supplement the established texts. In 1298 Pope Boniface VIII issued a further official collection to be appended to the *Liber Extra* as its *Liber Sextus* (*Sixth Book*). In 1317 Pope John XXII added to the growing body of canon law a further official collection, known as the *Constitutiones Clementis V* (*Clementine Constitutions*, or the *Clementines*) because it comprised principally decrees of Pope Clement V, together with the decrees of the Council of Vienne (1311-1312). Both the *Liber Sextus* and the *Clementines* immediately joined their predecessors in the legal curriculum. Zenzelinus de Cassanis compiled another brief, unofficial collection c. 1355—*Extravagantes Johannis papae XXII*—and this too soon augmented the course of studies. At the very end of the fifteenth century, printers began to add a further private collection, *Extravagantes communes*, compiled by Jean Chappuis, to the standard batteries of canonical texts that they published. This addition was formally recognized in 1582, when Gregory XIII included it in the official Roman edition of the *Corpus iuris canonici*.

Courts and Procedure

One weakness of early medieval canon law was that it had no well-defined procedures and no effective array of courts to implement its prescriptions. True, bishops from the time of Constantine (d. 337) enjoyed the right to judge offenses against the canons and to impose penalties enforceable by public authorities; and under the late Roman empire they adapted for their own use some elements of the procedures current in the civil courts. However, when the political fabric of the western empire began to crumble in the late fourth and fifth centuries, church courts had to accommodate themselves to the new polity of the west; and in the process they gradually assimilated practices—such as compurgation and the ordeal—that were current among the Germanic settlers with whom they now had to deal.

A specifically ecclesiastical procedural system and court structure gradually began to emerge toward the end of the twelfth century. At

the apex of the hierarchy of church courts were the papal courts in Rome. Until the beginning of the thirteenth century, the popes often presided in person and spent a large fraction of their time dealing with judicial business. Beginning with the pontificate of Innocent III (r. 1198–1216), however, the popes began to delegate all but a few critical cases to members of their entourage. By the mid-thirteenth century, more or less full-time judges and a battery of specialized tribunals had begun to appear at the Roman curia. The *Audientia litterarum contradictarum* dealt with claims to church offices and benefices; the Rota handled much of the papacy's matrimonial jurisdiction, as well as much other contentious litigation; the Camera dealt with financial disputes; and the Penitentiary concerned itself with indulgences, dispensations, and other types of cases involving the pope's spiritual jurisdiction.

Likewise, bishops in the late twelfth century and the early thirteenth century began to appoint officials—principal, commissary judges, and other officers to handle most of their judicial business. At the local level, the court of the archdeacon dealt with many routine complaints and the less serious disputes that litigants brought to church courts for resolution.

At about the same time, canonical procedure began to become more sophisticated and increasingly complex. The procedures that emerged in the ecclesiastical courts were modeled on late Roman *cognitio extraordinaria* and became in turn the model for the procedural system of the *ius commune* that was used by the end of the Middle Ages in civil courts throughout Italy, and indeed throughout most of continental Europe. This system in turn set the procedural pattern followed by civil law courts in Italy and elsewhere in the continent to this day.

Law: Criminal

Criminal law in medieval Italy varied by region and period, retaining elements from each historical development. Law went through an Ostrogothic-Byzantine period (480–740); a Lombard period (586–800); a period of a kingdom of Italy, with underlying feudal and customary law (800–1100); and a communal statutory and *ius commune* period (1100–1450). Law in Italy was often substantially affected by developments in ecclesiastical law, which sometimes followed and sometimes anticipated developments in civil law, or Roman law. Venetian law was outside the system of Roman law and therefore differed from the law of other northern and central Italian city-states. Southern Italy was often a political unit separate from the kingdom of Italy (the northern and central parts) and was affected by different legal influences.

Byzantine Period

The barbarian invasions of the western empire brought the Ostrogoths under Theodoric to Italy, where they set up a kingdom with their capital at Ravenna. Ostrogothic law was similar to other Germanic laws. However, Theodoric saw himself as vicar of the Byzantines, or the leader of the west. He redacted the *Edict*, consisting mainly of criminal law and procedure, for the Roman and Ostrogothic populations c. 500. Lawlessness was rife in this kingdom, and the settling of the warlike tribes was a challenge to the nascent kingships, as was corruption in judicial offices. The *Edict* was a thoroughly Roman law enactment, taken from the *Sententiae* of Paulus, earlier Roman codes (such as the

Gregorian and Hermogenian codes), and the Theodosian code. It established the Theodosian code as the primary Roman law code used in the west in the early Middle Ages. Whatever was covered in the *Edict* was governed by this Roman law for Ostrogoths and Romans; and whatever was not covered was governed by the custom of each people separately.

The Byzantines reasserted their power in Italy militarily by defeating the Ostrogoths in destructive wars conducted from 533 to 555 by the eastern emperor, Justinian, through his able generals Belisarius and Narses. The laws of the Ostrogoths appear to have been abolished, and the Ostrogoths were required to pledge obedience to imperial law. The Byzantines ruled through *tribuni*, who were nominal appointees of the Byzantine viceroy, the exarch of Ravenna, but were really major landowners who possessed great local power that became hereditary. During this period the great Justinianic code was promulgated, but it was little used in either the east or the west. In the east, it was replaced in 740. The barbarian west did not achieve the level of sophistication necessary to make use of this skilled piece of legislation and judicial thinking. Only the *Institutes*, the simplified part redacted as a textbook for the law school, and abridgements of the *Codex*, the decrees of emperors before Justinian, were used. The Germanic people, when they redacted laws for the Roman population, used mainly the Theodosian code. The real impact of the Justinianic code was felt in the revival of Roman law in the twelfth century. The Byzantines were driven out of northern and central Italy in 751.

Lombard Period

When the Lombards invaded Italy in 568, taking over two-thirds of the country, they were filling a power vacuum left by the destruction of the Ostrogothic kingdom at the hands of the Byzantines and the subsequent inability of the Byzantines to hold the northern and central parts from a distance. The Lombards' customs remained more purely Teutonic than those of other tribes, because the Lombards had migrated into the empire later (from southern Jutland) and had had only limited contact with the Roman world before migrating. In fact, they were one of the

last tribes to migrate, reaching Lombardy in 568 after renouncing Odin and becoming Arian Christians. They did not become Catholic until 618. Both Romans and Lombards lived under Germanic constitutional law, with some Roman personal law, until the mid-eighth century, when they were conquered by the Franks. The oldest Lombard code is the *Edict of Rothari* (643), which sought to preserve premigration customs. Additions to this code were made by Rothari's successors Grimbold (688), Liutprand (Luitprand, 712), Ratchis (745), and Aistulph (749). Liutprand made Lombard law conform to church law and instituted reforms based on Roman law.

The Germanic peoples had their own institutions and laws, which were very different from Roman law and were concerned with the vendetta, group (familial) liability, and the personality of the law (as opposed to territoriality). After contact with the empire, Germanic law was profoundly influenced by both Roman law and Christianity. Christianity introduced ideas of personal liability and intent, based on the model of individual accountability for sins. Contact with the empire solidified political structures where there had been none, other than the popular assembly, and created kingships—albeit weak ones—which after Charlemagne acquired additional validity from a perception that they had been established by divine will as well as by popular acclamation. Roman law brought a stronger monarchical figure who could legislate. The Christian idea that the king and the state had a duty to uphold the order and morals of the people was put into effect. Even the act of writing down custom in the form of statutes was a response to Roman written law. The main subject of these ordinances was Germanic criminal law.

The vendetta was the primary legal institution of the Germanic peoples because it required no state to enforce the law: crime—especially a personal offense—was seen as a strictly private matter between two families. When the tribes settled and began farming, such private warfare became disruptive, and thus unsuitable, and the kings attempted to control it and to find other institutions to deal with crimes. These attempts were often seen by the disputants as unjust interference. The law also resided in the people—their usages, their morals, and their common sense—through longtime practice. Thus no one, not even the king, could legislate—but everyone, especially the old

and venerable, could declare law. Old law was more valid than new law in the customary system. Even the king was subject to the law. In practice, this situation changed as the influence of Christianity made monarchy more elevated and more independent. The Lombard codes were distinct from all the other Germanic codes in being strongly monarchical instead of popular. The monarchical character of the law was the key to its successful blending with Roman law, and thus to its longevity when other Germanic codes were forgotten.

Vendetta occurred when a person from one clan offended a member of another clan, perhaps wounding or killing him. All the members of the offended family would then seek to kill or wound any member of the offending family. This was group action, because each clan conceived of itself as a "spirit pool" and felt that, as a practical matter, its own protection depended on maintaining its numerical strength. To kill a member of a clan was to diminish its spirit pool and to hurt all its members. This sense of group liability carried over into the time of compurgators, when a defendant's proof in court depended on the *number of* witnesses, largely family members, that he could summon to attest to his character. Efforts to control the vendetta were aimed not at disallowing it, but simply at limiting it, in deference to the honor and ethics of the clans. Revenge could not be taken on an entire clan but was restricted to the principal party—the offender—who could then himself be offended with impunity. Also, a scale of compositions, or money payments, was devised whereby one clan paid the other clan not to carry out the vendetta. A pecuniary compensation called a *wergeld* was substituted for the blood feud. The victim, or the victim's family, could either retaliate or accept money from the culprit, the amount usually being determined by the crime committed, the status of the culprit, and the status of the victim. The right to compensation was equal to the obligation of retaliation or payment. The compensation consisted of the capital, or *manwyrð*, which restored the value of the man (or property) destroyed; the *faida*, an equivalent sum to pay the opposed party for giving up its right to retaliation for the crime; and a payment to the state for breaking the peace.

Most of the barbarian tribes had pecuniary punishments by the time of the written laws; in fact, the written laws consisted mainly of levels of payments by class and crime. Crimes were increasingly considered

breaches of the public peace, and therefore a responsibility of the state. In Lombard law, the vendetta remained vigorous for an extended period, leading Rothari to raise the amount of the compensations in an effort to make them more attractive, judicial proceedings supervised by the state became more and more obligatory. Charlemagne established the principle that those who did not come to court when summoned lost all their property. Among the Salian Franks, property could not be seized without the intervention of a judge.

The attempt to restrict the vendetta caused some breakdown in the kin group. Retaliation was commuted to money, and no one was needed to carry out the vendetta, so the difference between active and passive loyalty began to disappear. Each person was treated individually before the law, not in the context of his family, so whole family was no longer held responsible for the crimes of one of its members. The Burgundian code observed, "In such cases let all know this must be observed carefully, that the relatives of the man killed must recognize that no one can be pursued except the killer; because just as we have ordered the criminals to be destroyed, so we will suffer the innocent to sustain no injury." The idea of a family spirit pool was also being destroyed by the Christian idea that everyone is accountable for his own actions before God.

The change in the understanding of crime from being a private matter to being a public matter was by no means complete during the Germanic period. In Lombard law 74 of Rothari, the king encouraged judicial proceedings because they were more durable, but he actually forbade vendetta only in cases of involuntary murder or involuntary damage—the law went on to say that the vendetta was allowed in every other case. This distinction between voluntary and involuntary crime was not Germanic, but Roman and Christian; previously, the vendetta had been exercised in cases of involuntary as well as voluntary offenses. However, the law that a person caught in the commission of a crime did not need a trial was a borrowing from Roman law. For some crimes, it was established that the culprit would be given in slavery to the offended party, who then would serve as a substitute for incarceration by the state. The state's resources for hunting down criminals were extremely limited, and the responsibility for apprehending criminals was incumbent on everyone in society. The

reporting of crimes was mandatory, and all strangers were looked on with great suspicion. Considerable self-help remained allowable; for instance, a man who caught his wife in the act of adultery could kill both parties.

German courts usually lacked good evidence pertaining to crimes. The institution of oath-takers, or compurgators, was a Germanic means of determining cases and deciding culpability. Compurgation was the practice whereby a defendant's innocence, or the truth of a plaintiff's claim, was determined not on the basis of objective evidence but by summoning a sufficient number of oath-takers to swear to his good character. Swearing an oath was a sacred duty (a false oath-taker would fear the wrath of God) and showed a significant commitment to the defendant, as well as to the obligation of the vendetta. Oath-taking was an original German institution that was adopted and used by the Roman population. As German law became regularized, so did the institution of oath-taking. A set number of oath takers were required for specific crimes: for instance, six of the defendant's kin chosen by the pursuer plus five more free men, chosen by these seven. Severe penalties were exacted for false oaths; thus external coercion was replacing moral suasion. The oath was a set formula, and if the swearer faltered in saying it, the trial was over: God had interceded to prevent the person from saying the oath. The church co-opted the oath, in that the swearing took place in church or on a relic instead of on the customary arms.

Trials by battle, ordeal, and torture were used as alternatives to compurgation; that is, if no oath-takers were available, there would be trial by battle or ordeal. The ordeal was originally a pagan practice in which the offender was sacrificed to appease the gods. This too was co-opted by Christianity, so that the ordeal became a trial decided by God. The main ordeals were the cross, boiling water, and a hot iron. (In the ordeal of a hot iron, a defendant would be made to carry a red-hot metal bar a certain distance; his hands would then be bandaged for a week and then unwrapped. If the wound had festered, the defendant was judged guilty; if it had healed, he was judged innocent.) By the time of Rothari, faith in the ordeal and battle had diminished considerably; and Rothari himself believed that these measures should not be used in important matters. In the Fourth Lateran Council (1215),

Pope Innocent III forbade the clergy to participate in trials by ordeal. Torture was typically used only against slaves, who could be put to torture in order to extract information or a confession. However, if a reasonable amount of evidence had been presented against a freedman, he too could be tortured to obtain a confession. Whereas the *Edict of Rothari* of 643 used irrational proofs such as judicial duels and compurgation, the codes of Liutprand (713-744) and Ratchis (744-756) also instituted some rational proofs, such as witnesses, inquests, and written documents.

Kingdom of Italy

Charlemagne decisively defeated the Lombards and ended the independent Lombard kingdom in 774. From then until 1100, law in Italy was formulated from the Lombard laws and Carolingian capitularies, and a legal school developed at Pavia in the tenth and eleventh centuries expounded these two sources. In 802, Charlemagne allowed each tribe subject to the Carolingians to retain its personal law, but he exercised the capitularies as territorial law over all the people. Throughout this period, northern-central Italy was organized in the kingdom of Italy, with its capital at Pavia. The king of Italy was usually also the Holy Roman emperor, as Charlemagne was. There was some centralization in the kingdom of Italy, with a royal law court at Pavia and state courts in many cities. The jurists of Pavia codified the law, making it a more coherent system; certain state institutions survived; and some knowledge of law and procedure seems to have been common.

However, it is a mistake to exaggerate the uniformity of the law. Local customs continued to be an important source of law, especially in areas remote from the state courts. The period from 800 to 1100 was also the period of feudalism in Italy; courts came under the supervision of local counts, who were great landowners. These counts had been empowered as representatives of the Carolingian government, and when the Carolingian central administration disintegrated they were left with land, military strength, and administrative and judicial powers. Feudalism faded much faster in Italy than elsewhere, because

there were some administrative survivals in the cities; thus there was a basis for the nascent communes during the economic revival that began in the tenth century, and feudal law was ignored during the first phase of formation of the law school at Bologna. Nevertheless, feudal law was being studied at Bologna by the twelfth century, because it remained in practice in many places. In the 1150s, Obertus de Orto wrote *Libri feudorum*, which was based on imperial legislation in the kingdom of Italy, decisions by feudal courts, Lombard customs, and extracts from the writings of the school of Pavia, recognizing that much custom was still in practice. Feudal law blended very well with Germanic customs and clan ethics and helped perpetuate them. Feudal law mainly concerned itself with land, but it also treated crimes; in criminal law, feudalism perpetuated Germanic customs. We should also note that bishops, who were often great landowners, had legal and administrative powers, not because of ecclesiastical jurisdiction but because of a lack of state powers.

The Period of the City-States

In the tenth and eleventh centuries, an economic upswing caused by technological improvements, better agricultural techniques, and an increase in population led to the resettlement of cities in Italy. This stimulated the creation of two kinds of law. One kind, necessitated by the growth of the cities, took the form of the collection and writing of custom and municipal law—the statutes. The other kind took the form of production of the *ius commune* and included a revival of Roman law associated with the University of Bologna. Statute law and *ius commune* were closely linked and interacted continually in the formation of legal judgments.

Ius commune was a fusion of Roman, canon, and feudal law that formed a common jurisprudence in Europe from 1100 to 1800. The *Florentine Digest*, a sixth-century copy of the *Digest of Justinian*, was found in Pisa by the twelfth century and was stolen by the Florentines in 1406. This revival of Roman law affected criminal law mostly by introducing inquisitorial procedures, rather than by changing the actual substance of criminal laws. William Durantis wrote an important book

on criminal procedure, *Speculum Iudiciale* (*Mirror of Procedure*), and Albertus Gandinus wrote one on evidence and procedure, *Tractatus Maleficorum* (*Treatise on Crimes*). The commentator Angelo Aretino wrote another *Tractatus Maleficorum*, which was arranged according to the order of a trial and represented the final accommodation of Roman law to practice.

In many of the northern and central Italian city-states, the court systems were headed by the *podestà* and the *capitano del popolo* (captain of the people). The various city-states were similar in this regard because many of them had experienced similar communal movements in which various segments of the population, sometimes including the guilds, banded together to form the government. Administration of the cities often passed from the bishops to groups of consuls, who later chose the *podestà* as their head. Originally, the executive officials had both executive and judicial powers; but as administration and law became increasingly complex, each acquired its own officials. The *podestà* and the *capitano* lost their executive powers and became strictly judicial officials. Because factionalism and the arrogance of certain families were the salient problems of the nascent communes, the *podestà* and *capitano* of a city-state had to be foreigners—that is, from another Italian city-state—so that they would be objective. This requirement evolved into a system in which foreign rectorors—that is, the *podestà* and the *capitano*—traveled from city to city bringing with them their own judicial officials, including civil judges, criminal judges, a police chief, law enforcement officials, and pages. This cadre of officials would spend a few weeks reading the statutes of the city and then began their work.

During the late medieval period in Italy, the criminal law systems of the various states adopted inquisitorial procedure as their trial method. In this method, the court system conducted most of the trial; either all the proceedings—initiating, gathering information, compelling witnesses, weighing evidence, sentencing, and executing sentences—or all except initiation. The court system conducted investigations to establish objective substantive facts and had the power to initiate and prosecute cases *ex officio*. This state control of trials was new, and it was possible only because of the growth and increasingly public nature of the communal governments: in the early fourteenth century, fiscal

exigencies led the communes to terminate many privileges, immunities, and usurpations, changing many aspects of government from private to public.

Earlier, accusation—whereby the accuser named the defendant and provided the evidence—had been the principal method of bringing crimes to the attention of the court system and initiating cases. Even after inquisition became common, accusation continued for a while to be the ordinary and favored way to initiate a case. However, an accuser who did not prove his case had to pay all court fees, fines, and a set fee for every day that the defendant spent in prison, and by the late Middle Ages these liabilities tended to drive would-be accusers from the courts. At first, in cases initiated by accusation, the judge acted only as an orchestrator of the trial, with the two litigants doing all the work themselves, almost as if the case were a private matter. Gradually, though, court systems became more interested in ensuring that crimes coming to their attention through accusation were properly and fully prosecuted. As a result, accusation-initiated cases were increasingly handled like inquisition initiated cases. There was still some deference to the private nature of accusation, in that before the case could be initiated *ex officio* the judge was required to ask the logical accusers to make allegations. However, public initiation came to be permitted for all serious crimes. Court officials thus had greater responsibility over the conduct of all parts of the trial, and this new independence from private accusers encouraged the transition of crime from a private to a public matter.

Likewise, in the proof stage of the trial, inquisitorial procedure fostered the development of methods of independent investigation, such as sending out routine police forces with appointed rounds, gathering information and attaching witnesses at the scene of a crime, and compelling those witnesses to appear in court. Some of these independent means of collecting information involved hearsay and torture. Hearsay was the collecting of information concerning a crime from people who had no direct knowledge of it, but merely attested to what had been rumored in a neighborhood and in public places. Hearsay could initiate cases, and it could also provide proof when individuals came forward in sufficient numbers to constitute an *inditium*, a piece of prior evidence or proof that allowed torture.

Apparently, hearsay was considered an almost necessary component in trying crimes of a public nature or serious crimes. Public fame was also used in the ecclesiastical courts and was a significant mechanism in a great variety of court cases. Pope Innocent III adapted the Roman law equivalent of hearsay, akin to *notorium*, to its much more useful medieval form. Today, hearsay evidence is deprecated, but before modern technology for gathering and analyzing evidence had been developed, the neighborhood was undoubtedly considered a valuable source of information—often the only source. Torture was frequently applied to exact confessions; *inditia* (prior information) was sometimes but not always required for torture. Torture became important and desirable because the *ius commune* set a high standard of proof for a conviction: two eyewitnesses or confession. In reality, in order to convict anyone at all, various strategies were adopted, such as the addition of partial proof. (In Venice, a half-proved crime was punished with a half-penalty.) Also, defendants were convicted in absentia if they were contumacious—that is, if they had fled instead of appearing in court. This was a departure from the *ius commune*, which forbade conviction in absentia.

Criminal cases could, then, be initiated through private accusation, denunciation by minor judicial officials, hearsay, or ex officio by judges and foreign rectors. Cases that were initiated ex officio could be crimes interrupted *in flagranti*—i.e., in the act of commission—or any other crimes of which the rectors gained knowledge. In such cases, reports by law-enforcement officials became increasingly important, and these officials served as witnesses in the courts. Sometimes when the culprit was unknown, a general inquest was set up concerning the crime; this inquest turned into a specific inquest when a defendant was named. In all cases, a great deal of the information probably came from the logical accusers, even if they were reluctant to take on the liabilities of accusation.

Once a case was initiated, the defendant was cited three times, as specified by the *ius commune*; either at his home (if he had one) or at the parish church and in public *piclzze* if he had no home. Citation was seen as part of divine law; therefore, it was difficult to omit this step and proceed directly to an arrest, despite the fact that citation gave defendants plenty of time to leave town, as they frequently did.

Defendants, innocent or guilty, were likely to flee a court system in which judicial torture was used. From the statements of private accusers, logical accusers who did not accuse, hearsay accusers, witnesses to the crime, and police reports, a document of accusation or inquisition was redacted. When cited, the defendant was expected to come to court to respond to the charge as expressed in this document. He could respond to the citation in one of four ways: deny the charge, confess, pose an exception, or flee. If he came to court to deny or confess, and if the crime was a serious one entailing corporal punishment, he was detained in prison. But if the crime entailed only a pecuniary penalty and if he provided oath-swearers, he could be released.

There were several kinds of exceptions that the defendant could pose: dilatory exceptions, which only delayed the trial; exceptions that changed the severity of the charge; and exceptions that put the whole proceeding aside and stopped the trial. One kind of dilatory exception was brought by another person: a claim that the defendant was out of town and could not respond to the citation until he returned. An exception affecting the severity of the crime might, for example, be a claim that the crime had not been committed at night, and thus was not subject to the double penalty of nighttime crimes; or that the crime had not been committed near a church or public *piazza*, and thus was not subject to the double penalty of place. Another such exemption involved a claim that an assault had not left a lasting scar or had not disabled a limb; doctors would then be sent to investigate. An exception that put the trial aside might involve a claim that an instrument of peace had been drawn up between the victim and the defendant; private peaces were allowed to abrogate public trials, for the sake of conflict resolution. Another claim of this nature was that the victim had not paid his taxes and so should not be protected by law; still another was that the accuser could not bring a case on his own because he was not emancipated from his father. If the defendant never came to court at all, he could be exiled. This meant that after a certain period of time had elapsed he was declared contumacious and, therefore, guilty (being declared contumacious was considered the same as a confession). If the crime was serious, a person who had been exiled could be offended by anyone with impunity; if an exiled person was captured, he was

delivered to the court.

A defendant who came to court could confess or deny rather than pose an exception. A confession was sometimes motivated by an incentive such as a reduced fine, but confessions might also be extracted by torture. Judges found it desirable to exact a confession because this was considered clear proof. The decisions of judges were reviewed in a process called syndication, and some portion of a judge's salary was withheld if he did not adhere to the law. Therefore, judges were concerned with condemning only with sufficient proof, and torture became very important. A defendant who confessed under torture had to repeat the confession at the bench in order for it to be valid. These confessions were said to have been given spontaneously, even though they were exacted through torture. Accusers could also be tortured to make them retract false accusations, and witnesses could be tortured to make them admit that they had given false testimony.

If a defendant came to court to deny his guilt, the denial started a process called a contested litigation. The defense and prosecution were then given a short period to prepare their cases. The prosecution created a new document, much more conservative and exact, called a *capitula*, which stated what the prosecution actually intended to prove. At first, interrogations were based very strictly on these *capitula*, but gradually the judge acquired greater latitude to ask other questions he considered pertinent. After the examination of the witnesses, both parties made their allegations before the judge. For most crimes, a set amount of proof was necessary to condemn; but in practice, proofs varied and some combinations of proofs were usual. The amount of proof necessary was based not only on the seriousness of the crime, but also on other factors, such as the difficulty of acquiring proof or the desire of the court system to convict. Thus, less proof was required for crimes of a secretive nature, such as sodomy, and for crimes in which a conviction was desired, such as political crimes.

Condemnation or absolution had to be reached within twenty-five days from the response. Judges and rectors usually conferred to decide cases. Penalties could be either corporal or pecuniary. Most penalties were pecuniary, but if the culprit could not pay he was imprisoned until he completed payment. Those who could not pay in the first place rarely could pay after they were imprisoned. However, after several

years, criminals who had been in prison for nonpayment were released as oblations, offerings to God. These oblations were a necessary part of the system, because otherwise the prisons would keep filling up and would never empty.

Venice

Venice developed very differently from the other Italian city-states because it had been founded during the barbaric period, when the social fabric was disintegrating. Moreover, it never had a feudal class, because it had no mainland, or *terra firma*, possessions until the fifteenth century (although it did have landed possessions abroad); it never went through a communal period; and it never gave much political power to its guilds. Venice consciously rejected Roman law in order to thwart imperial aspirations aimed at limiting its independence and extending imperial jurisdiction and regalian rights. Venice used *ius proprium*, or Venetian custom, in its courts. Customary law in Venice at first borrowed much from surviving Roman law; but by the time the Venetians collected their statutes in the early thirteenth century, Roman law had been purged. Venice was never part of the traveling *podestà* system; rather, the Venetians judged cases in councils that had judicial and executive authority, such as the Council of Forty. As a consequence of the *serrata* of 1297—which limited membership in the major council to certain aristocratic families—the government and the court system, including both the policing bodies and the judicial officials, were dominated by aristocrats. In 1310, the Council of Ten was added to the traditional court system. Its purpose was to prevent conspiracies and try political crimes. In 1320, "the Ten" got its own police force; thereafter it could proceed from arrest to execution without external checks if the case was a threat to security. The Ten accepted autonomous accusations.

The first redaction of criminal law was the short but important *Promissio*, a section of Doge Iacopo Tiepolo's statute compilation of 1232. It consisted partly of a scale of severe sanctions for theft. Venetian law was generally characterized by the greater *arbitrium*, or discretion, given to the judge. Judges had important powers of discretion to decide

cases by analogy and to use their own common sense instead of following principles in the writings of jurists. Cases were often initiated by a *querela*, an accusation not burdened by the usual heavy liabilities. Torture was frequently used in the proceedings. Self-help was encouraged by rewards for bringing in or killing exiled persons.

The *avogadori* were advocates for the state, public prosecutors who presented cases before the Council of Forty. The *avogaria* was entirely manned by amateur nobles who gained experience of the law through practice. This office usually fell to the highest nobles. Originally, the *avogadori* were defenders of the fisc (treasure) and protectors of the goods and rights of the state. As crimes came to be seen as offenses against the state, the *avogadori* gained criminal jurisdiction. A law of 1289 stated that because the *avogadori* were often targets of private vendettas, they were permitted to bear arms. The *avogadori* could receive cases from the Council of Forty or from the policing groups—the *cinque alia pace* and the *signori di notte*. After the *avogadori* received an accusation, they initiated an investigation that mainly involved taking testimony from the witnesses and the defendant. The defendant was usually interrogated by an *avogadore* in the presence of the council. Judicial torture was often used. The evidence was compiled by the *avogadori* in the *intromissio*, the statement of the prosecution's case. The *intromissio* was presented in front of one of the councils, usually the Forty, accompanied by an oral debate between the *avogadori* and the defendant's lawyer. Then the council voted on guilt or innocence. Penalties could be suggested by the *avogadori*, the doge, or the council, but the actual penalty was decided by the council.

Southern Italy

Because southern Italy was under Byzantine control for a long period, it was very familiar with the Justinianic code and the codes of emperors Leo III (r. 717–740), Basil I (r. 867–886), and Leo VI (r. 886–912). The manuscript of the *Digest* known as the *Florentine* came from southern Italy. In the late eleventh century, various Norman bands conquered parts of the south from the Byzantines, Muslims, and Lombards. In 1130 Roger II consolidated these pieces into the kingdom of Sicily, including

both Naples and Sicily. The cities in this region had been using their own customs in their courts, and they petitioned for this privilege in their treaties of surrender. Although Roger II agreed, he violated these treaties and forced judges to rule according to the laws of the kingdom, the *assisiae*. He created the justiciarship, which linked royal and local government, and began royal legislation with the assizes of Ariano in 1140. However, cities such as Bari retained customary usage and redacted their customs, one part being based on Roman law and one on Lombard law. The legal traditions of the south were affected by Lombard law, Byzantine law, Norman law, feudal law, canon law, and the Roman law at Bologna. Southern jurists were interested in both the revival of law centered in Pavia and the revival of Roman law in Bologna.

Frederick II began to rule Sicily in 1220, repressing local freedom and autonomy and promulgating the *Liber Augusta lis* or *Liber Constitutionum* of 1231. In this compilation, Frederick mandated that royal law be followed first; then, failing this, municipal customs; and finally, failing that, *ius commune*. Frederick tried to impose peace on a violent society. He compelled the attendance of plaintiff and defendant in court. The *Constitutions* gave a privileged place to the nobility: higher penalties were attached to offenses against nobles, and greater weight was given to oaths taken by nobles, especially in cases involving debt. In southern Italy the barons were adamant in their wish to be permitted a trial by peers. Underneath royal legislation there always remained a layer of custom and municipal, Roman, and feudal law.

Law: Germanic

See Lombard Law

LAW: ROMAN

Roman law was the system of law developed in ancient Rome and subsequently revived during the eleventh and twelfth centuries. Medieval Roman law, together with canon law, became the ancestor of the civil law systems still used on the European continent today.

During its classical period (between c. A.D. 100 and 250) ancient Roman law reached a level of sophistication and precision unmatched anywhere in antiquity and not often rivaled since. Its achievements were primarily intellectual rather than institutional, growing principally from the analytical insights of jurists, whose work informed subsequent innovations by legislators.

In the period following the Germanic invasions of the western Roman empire during the fourth and fifth centuries after Christ, Roman law gradually ceased to be taught systematically, although courts that dealt with disputes among the descendants of the old Roman population of the west continued to use simplified Roman law principles and procedures for centuries after Roman political power had vanished from the west. Meanwhile, in the eastern Roman (or

Byzantine) empire, Emperor Justinian I (r. 527—565) engaged in a monumental effort to bring order into the enormous mass of law that the Roman state had produced over the course of a millennium and more. In 528, Justinian appointed a commission to review the accumulated mass of Roman legislation and purge it of obsolete and inconsistent material. Although the commissioners produced a codified collection of statutes about eighteen months later, Justinian was not entirely satisfied with their work, and in 530 he appointed a fresh codification commission, headed by a scholarly and energetic jurist named Tribonian. Within just three years Tribonian and his fellow commissioners reviewed and reduced to manageable proportions the enormous mass of Roman juristic commentaries and pronouncements. This second commission presented the emperor in 533 with the *Digest*, or *Pandects*, a vast anthology of fifty books containing excerpts drawn from a whole library of juristic treatises and commentaries, arranged and cataloged by topics for easy reference. Justinian officially promulgated the *Digest* and directed his judges henceforth to use its doctrines as the official guide to the interpretation and application of the law. In 534 the commission presented Justinian with a revised codification of the statutory law in twelve books, replacing the earlier anthology, and the emperor at once abrogated all earlier statutes and officially promulgated the new collection under the title *Codex Justinianus* (the *Code*). This new *Code* thus included all Roman legislative enactments that were still effective in Justinian's time, and it remained the fundamental statute book of the Byzantine state for nearly 1,000 years.

Tribonian and his assistants also produced in 533 an introductory textbook, the *Institutes*, as a guide to the law contained in the *Digest* and the *Code*. This *Institutes* was in effect a revised and updated version of a classic Roman law textbook, the *Institutes* of Gaius, which had long been used as an elementary introduction to legal studies.

Lawmaking did not, of course, stop dead in 534 with the promulgation of the second version of the *Code*. Justinian himself created numerous new laws, and these laws, together with those of his immediate successors, were compiled as a supplement to the *Code* not long after his death. The supplementary collection, known as the *Novels* (or *Novellae leges*), soon came to be accepted as an integral part of the

revised Roman law and was studied in Byzantine law schools, together with the *Digest*, *Code*, and *Institutes*, as the core of the legal curriculum.

These developments made little immediate impression in the west. There, Justinian's codification was known only in those few scattered areas, mainly in Lombardy and the region around Ravenna, that remained subject to Byzantine rule. Elsewhere, Roman law was known and used during the early Middle Ages only in simplified and vulgarized texts, many of them derived from an earlier experiment in codification, the *Codex Theodosianus* (438). Knowledge of Roman law never entirely disappeared in the west, and a few writers throughout the early medieval period occasionally showed some slight acquaintance with Roman legal texts; but the work of the jurists, the most sophisticated and creative component of Roman law, remained virtually unknown until the mid-eleventh century.

Then, under circumstances that are still not fully understood, there occurred a sudden revival of interest in and knowledge about the doctrines of the classical jurists. One solitary manuscript of Justinian's *Digest*, written late in the sixth century (and now in the Biblioteca Laurenziana in Florence), was somehow rediscovered by judges and teachers of law in Italy. One of the men involved was an otherwise obscure judge named Pepo, who cited passages from the *Digest* in decisions that he handed down in the 1070s. Another, and more significant, figure in the juristic revival was a law teacher named Irnerius (Guarnerius, c. 1055-c. 1130). Irnerius was employed at various times as a judge and legal adviser by both Countess Matilda of Tuscany and the German king and emperor Henry V (1086-1125). Of greater lasting importance was Irnerius's work as a teacher and writer. Irnerius taught Roman law at Bologna and was apparently familiar with the entire text of Justinian's codification. He is credited with the authorship of numerous glosses—explanations and commentaries on individual words and passages scattered throughout the text of Justinian's codification—which he apparently read and commented on systematically with his students. It was especially significant for the development of a revived Roman legal science that Irnerius introduced his pupils to the *Digest*—the most difficult, but in many ways also the most important, part of the codified Roman law—since it was from the

Digest that both he and his students learned to use the analytical tools that classical lawyers had devised to construct a coherent intellectual system out of the rules, regulations, and procedures that the law furnished.

Irnerius was evidently an inspired and inspiring teacher, able to imbue his students with a lively interest in the law both as a tool for the orderly management of practical matters and as an intellectual instrument for the investigation and analysis of government, transactions between people, and the institutions of public and private life. The best-known of Irnerius's students were the "four doctors"—Martinus Gosia (died c. 1160), Bulgarus de Bulgarinis (d. 1166), Hugo de Porta Ravennate (died c. 1166 or 1171), and Jacobus de Porta Ravennate (d. 1178)—who advised Frederick Barbarossa in his negotiations with the Lombard cities at the Diet of Roncaglia (1158) and obtained from the emperor privileges for themselves and for the law students they taught at Bologna. These "doctors," like their master, taught law as well as practiced it and helped train a third generation of jurists in the intricacies of Roman jurisprudence. The pupils of Irnerius's pupils included such talented lawyers as Rogerius (died c. 1170), Johannes Bassianus (died c. 1190), Placentinus (d. 1192), and Vacarius (d. 1198). Thus, by the end of the twelfth century a tradition of legal studies and teaching centered on Roman texts had become established at Bologna, where indeed it has continued to the present day. The fourth generation of law students at Bologna included one of the greatest medieval Romanists, Azo (d. 1220), whose *Summa* on Justinian's *Code* became a classic of medieval legal literature and continued to be studied and cited for centuries. In the following generation, one of Azo's students, Accursius (d. 1263), compiled from the scattered writings of his predecessors a standard commentary, the *Glossa ordinaria*, on the entire body of Roman law as codified by Justinian. This *Glossa ordinaria* became a staple of the legal curriculum, not only at Bologna but also at the other centers of juristic studies that had begun to spring up elsewhere in Italy and France in imitation of the Bolognese law school.

The Roman law texts that these teachers expounded to their students were difficult to grasp: despite the efforts of Tribonian and the other codification commissioners, the texts were often inconsistent with one

another, and their meaning was frequently obscure. This was especially true of the *Digest*, where authors who dealt with the same topic had sometimes written about the law at different stages in its development, with results that could be very confusing indeed. The *Code* also presents numerous difficulties, and even the *Institutes*, which was designed to explain the basic rules and assumptions that underlay the other texts, did not always succeed in articulating them clearly or unequivocally. Medieval expositors of Roman law, especially during the first three generations following the revival, accordingly spent a great deal of effort attempting to clarify the meaning of enigmatic texts, reconciling inconsistencies between them and identifying principles that would link disparate texts with one another. Once some of these basic problems had been dealt with, later generations of jurists in the medieval law faculties were more inclined to concentrate on identifying ways in which the ancient texts and principles could be applied or adapted to current problems in their own societies.

The questions that most interested medieval glossators and commentators on Roman law were typically problems of private law and centered on relationships between individuals, rather than on public law issues concerning the powers and organization of government. They were intrigued by the conceptual and practical problems that arose from the ownership and transfer of property, as well as the rights and limitations that attended its possession. Contractual relationships, partnerships, and associations furnished them with further intriguing problems, as did commercial transactions, for which they found instructive and useful models in the ancient texts. Personal status likewise raised important and perplexing issues, for which the ancient texts required significant adaptation. Roman jurists were much concerned, for example, with slavery, which was not especially common in medieval Italy, but whose principles could be selectively adapted to deal with and explain the rights and obligations of serfs, bondsmen, and indentured servants, who were much more numerous. Likewise, medieval law teachers sought to adapt Roman procedures for resolving disputes to situations in their own societies and to frame rules for litigation and arbitration that were consistent with the ancient models but responsive to contemporary needs.

Bolognese jurists and their counterparts elsewhere (most of whom

received their legal training at Bologna) accordingly applied devices and techniques used by contemporary rhetoricians in order to resolve conflicts and inconsistencies between their ancient texts and the realities of medieval Italian life. The most characteristic of these devices was the dialectical distinction, which the jurists used to isolate basic, underlying principles from the mass of Roman laws that dealt with the changing and variable details of ancient social problems. Once a jurist had identified a general rule to his satisfaction, he then sought to apply it to problems and situations current in his own society. Legal analysis, as medieval jurists practiced it, thus involved both a search for the durable principles of the ancient Roman legal system and an effort to fit the realities of contemporary life to those principles. The study of law, as they conceived it, was thus both a speculative science concerned with defining the essential principles of an orderly, stable, and fair society and a practical science that sought ways to apply those principles to concrete problems and situations in everyday life.

Given the speculative character of the medieval study of Roman law, it is scarcely surprising to find that writers and teachers often differed from one another on important issues both of principle and of application. Medieval law teachers characteristically analyzed for their students not only the content of the ancient texts but also the differing views about them current among their contemporaries, and they described the probable consequences of adopting one view or another. The medieval law student accordingly learned by precept and example how to analyze conflicts of opinion and how to resolve opposing views of a problem. It was due to these skills, as much as to their detailed knowledge of legal rules and techniques, that men trained in law were considered useful, and eventually indispensable, advisers and counselors by medieval rulers, ecclesiastical administrators, and merchants.

This in turn made the study of law a profitable enterprise. As early as the twelfth century, John of Salisbury complained that students were deserting the liberal arts for the lucrative science of the law, and Saint Bernard of Clairvaux advised Pope Eugene III to take a whip and drive the Roman lawyers from his court, as Christ had driven the money changers from the temple. By the thirteenth century, however, men trained in Roman and canon law were not only advisers to church

officials and secular rulers, but they were beginning to receive appointments to positions of power and authority in large numbers in their own right, as bishops, archbishops, cardinals, and popes. Men trained in law increasingly dominated the church in Italy and elsewhere during the High and later Middle Ages, and legal skills were also becoming an essential qualification for governors, podestats, and other high-ranking officers of civil administration. Contemporaries often complained about these developments: theologians lamented an ascendancy of law over their own discipline, and social critics denounced the delays and expense that, they claimed, greedy lawyers introduced into the legal process in order to fatten their own profits. But neither the harshest critics nor the most ingenious divines could burke the fact that the knowledge and analytical skills of trained lawyers were becoming indispensable in dealing with the realities of increasingly urban and commercial societies.

Italian legal scholarship dominated the writing and teaching of law from the revival of the study of Roman law in the time of Irnerius to the rise of humanist jurisprudence in the sixteenth century. The early generations of learned civilians (as writers and teachers of Roman civil law were often called) focused on the problems of understanding the meaning of the Roman texts, exploring relationships between different parts of the texts, and identifying the principles on which classical jurisprudence had worked. The early civilians characteristically wrote in the form of glosses—brief explanations and references often placed in the margin of the text on which they were commenting, so that text and commentary could be read side by side. Hence these early civilians are sometimes referred to as glossators.

Later civilians, after the generation of Accursius, cast their legal writings in different forms. They produced commentaries—voluminous expositions that usually followed the order of a text but were written and studied separately from it. The commentaries usually focused primarily on the application and adaptation of Roman law to current problems and concerns. Legal writers in the later Middle Ages also produced numerous monographs, which treated a single type of problem or a single branch of the law in exhaustive detail, and *consilia*, which were formal opinions on the law applicable to a specific case or situation. Major Italian writers among the civilians of this period

included Odofredus (d. 1265), Cino da Pistoia (1270-1336), Baldo degli Ubaldi of Perugia (1327-1400), Paolo di Castro (d. after 1441), and Alessandro Tartagni (d. 1477). The greatest was generally reckoned to be Bartolo da Sassoferrato (1313-1157), whose magisterial *Commentary* strongly influenced all subsequent legal writers in the Italian tradition down to the nineteenth century.

The Italian style of jurisprudence (*mos italicus*) was challenged in the sixteenth century by the new humanist jurisprudence, cultivated particularly by French writers and accordingly known as the French style, or *mos gallicus*. Writers in the new French style scorned the practical and applied concerns of their Italian rivals. The French jurists concentrated instead on using Roman legal texts as tools for historical investigation that would enable them to understand more accurately the society and civilization of the ancient world, rather than as tools for the fair and orderly management of contemporary issues and problems. Despite the great prestige and popularity that *mos gallicus* achieved in the early modern period, writers in the Italian style of jurisprudence continued to flourish and to exert considerable influence on the practice of law down to the period of the French Revolution.

Legenda Aurea

Legenda aurea was the most famous medieval anthology of readings about the saints and major festivals of the church. It was originally compiled in Latin by the Dominican friar Jacobus da Voragine (Jacopo da Varazze), probably during the 1260s, and entitled merely *Legenda sanctorum*—i.e., "material to be read about saints." Evidently, it was designed as a reference book for students and preachers of Jacobus's own religious order, though it eventually reached a much broader audience. Jacobus originated little if any of the material; rather, he borrowed selectively from earlier legends and works of church history, choosing memorable stories and useful information that he abridged according to his own priorities and arranged in some 180

chapters, following the order of the liturgical year.

The *Legenda* had two Dominican forerunners and models: *Abbreviatio in gestis et miraculis sanctorum*, by Jean de Mailly; and *Epilogus in gesta sanctorum*, by Bartholomew of Trent. They had obviously achieved some currency; about twenty manuscripts of each have survived. But these earlier abridged legends were completely overshadowed by the great success of Jacobus's book. The *Legenda*, which soon acquired the honorific adjective *aurea* ("golden"), survives in more than 900 Latin manuscripts, many augmented with chapters on additional saints. Jacobus's book also gave rise to numerous translations and adaptations in medieval vernaculars, and its popularity lasted more than 200 years. In the late fifteenth century it was still in such demand that it became a best-seller for the new printing industry, which issued at least eighty-seven Latin editions and sixty nine vernacular editions between 1470 and 1500.

In the sixteenth century, the status of the *Legenda* fell dramatically. Strict Protestants considered it idolatrous because it promoted the cult of saints and images, and it was also attacked by prominent Catholic scholars such as Juan Luis Vives, Georg Witzel, and Melchior Cano, who objected both to its Latin style and to its content, which they found less trustworthy than older sources on saints and church history. By 1600 the book's reputation had sunk so low that it tarnished the very word *legend*, which came to mean an unreliable story. Virtually no one published the *Legenda* again until the nineteenth century, when antiquarians revived and promoted it as a forgotten medieval classic.

Scholarly study of the *Legenda* was rare until the 1980s, when three books appeared in quick succession: a major literary-critical analysis by Boureau (1984); a more historical study by Reames (1985), the present author, who attempted to understand the Renaissance reaction against Jacobus's book by defining its particular theological and political biases; and the proceedings of an international symposium (Dunn-Lardeau 1986) at which some twenty additional scholars described their own research on the Latin *Legenda* or its vernacular offshoots. More important publications followed in the 1990s, including such essential research tools as Fleith's inventory (1991) of surviving Latin manuscripts, Maggioni's study (1995) of manuscript variants, the first reliable translation into modern English, and the first critical edition of

the Latin text. As shown by the proceedings of a symposium in Geneva in 1999 (Fleith and Morenzoni 2001), research continues on many aspects of the book and its influence.

Legnano, Battle of

In January 1176, Emperor Frederick I Barbarossa's negotiations with the Lombard League of northern Italian communes and Pope Alexander III broke down. Frederick decided to create a giant pincer that would

militarily isolate the leading city of Milan from the Lombard League. His marshal, Christian of Mainz, would advance northward from Apulia, while an army of German knights would gather near Lake Como and press southward to join an army of loyal Pavians around Milan. Frederick's forces—though they were infamously abandoned at Chiavenna by Henry the Lion, duke of Bavaria and Saxony—would be considerable. For its part, the Lombard League had been injured by the loss of several cities, but its rectors quickly assembled an army in Milan with contingents from several member communes.

On 29 May, some 1,200 horsemen and assorted infantry units accompanied the Milanese *carroccio* (standard-bearing cart) northward to thwart Frederick before he could link up with the Pavians south of Milan. Seven hundred cavalymen of the Lombard League attacked a vanguard of some 300 imperial horsemen near Legnano, about 18 miles (24 kilometers) north of Milan. Frederick and 2,000 cavalymen came to the rescue of the vanguard, and the imperial assault was soon unleashed along the length of the League's line. The fighting then centered on the Milanese *carroccio*, which was stoutly defended by pikemen and the Company of Death, men sworn to die sooner than accept defeat. Frederick himself charged the *carroccio* and went down in the melee. Many German lords had also fallen, and the German troops, disheartened by the apparent loss of Frederick, broke off and fled. Many were slaughtered in the pursuit, and the imperial baggage train was sacked.

Frederick, however, was only wounded. He limped into Pavia and began to sue for a settlement. Through the peace of Venice (1177) he obtained a six-year armistice with the Lombard League (ratified by the peace of Constance, 1183); and under the peace of Anagni he agreed to recognize the legitimacy (since 1159) of Pope Alexander III and of the city of Alessandria. In Italy, Frederick thus lost imperial dominance but gained political stability through a shift to feudal overlordship.

Leo I, Pope

Pope Leo I (saint; c. 400–461, r. 440–461) was called "the Great." He was an able and energetic pope, dedicated to promoting the primacy of the bishopric of Rome and combating heresy. He was both admired by his contemporaries and revered in later centuries. Leo's vigorous leadership in Rome, and in the church as a whole, helped lay the foundations for the spiritual and temporal authority of the medieval papacy. His surviving sermons (ninety-six) and letters (143) are important sources for the history of the early medieval church.

Very little is known about Leo's early life. His parents were probably Tuscan, and he may have been born in Rome. He was an archdeacon under popes Celestine I and Sixtus III, and an influential adviser to both of them. His reputation appears to have spread beyond Rome: in 430, Bishop Cyril of Alexandria sought Leo's support in an attempt to prevent Jerusalem from being made a patriarchate. At the time of his election to the papacy, in August 440, Leo was in Gaul on a diplomatic mission for the imperial court. He returned to Rome and was consecrated on 29 September.

As pope, Leo considered himself the heir not only to Saint Peter's bishopric but to Peter's universal authority over the entire church. In describing the scope of his authority, Leo introduced the concept of "plenitude of power": the pope's fullness of power in religious matters, as opposed to the partial power of other bishops. Although Leo's claims were not readily accepted in the east, he was able to obtain an imperial rescript from Valentinian III confirming his authority over the western portion of the empire. Leo exercised his power most actively in Italy, intervening in local dioceses to settle disputes and enforce uniform practices. His advice and decisions were also sought by the bishops of Spain and Africa, despite the traditional autonomy of the latter. Leo also took pains to maintain the papal vicariate in Illyricum in the southern Balkan peninsula, although that territory was in fact part of the eastern empire. In Gaul, Leo came into conflict with Bishop Hilarius of Aries, who appeared inclined to act independently of Rome. Leo confined Hilarius to his diocese and later divided authority over the Gallic bishoprics between Aries and Vienne.

Leo was an ardent opponent of heresy, a concern which was evident even before his election to the papacy. He was involved in the events that led to the condemnation of Nestorianism by Celestine I in 430, and he encouraged Sixtus III to reject an appeal by the Pelagian bishop Julian of Eclanum. In 445, Leo persuaded the secular government to revive earlier legislation against the Manichees, and in 447 he advised the Spanish bishops on combating Priscillianism. He also preached against all these heresies, as well as against remnants of Roman paganism. His greatest success as a promoter of orthodoxy, however, was in a debate surrounding the teachings of Eutyches. Eutyches was an eastern abbot who had been condemned and deposed by Bishop Flavian of Constantinople in 448 for teaching Monophysitism—the belief that Christ's divine nature had completely absorbed his human nature at the incarnation. Eutyches appealed to Rome, but Leo upheld his condemnation in a letter to Flavian. In this letter, generally called the *Tome*, Leo set forth the orthodox position that divine and human nature coexisted in Christ, inseparable but distinct and unmixed. Despite this agreement between the patriarchs of Constantinople and Rome, the Byzantine emperor, Theodosius II, convened a council to settle the matter. The council, which met in Ephesus in August 449, spurned Leo's

letter, upheld Eutyches's teachings, and condemned Flavian. Leo in turn rejected the council, describing it as a *latrocinium* ("violent robbery") and calling for a new council. Theodosius's successor, Marcian, summoned such a council in 451. Meeting at Chalcedon, this Fourth Ecumenical Council accepted Leo's *Tome* as presenting the orthodox teaching on Christ's natures and once again condemned Eutyches.

Although Leo's Christology was received with respect at Chalcedon, his claims of papal primacy were not: one of the canons passed at the council, number 28, gave the see of Constantinople the same status as the see of Rome. As a result, Leo delayed his approval of the council; he waited until March 453 to endorse it, and even then he rejected canon 28, arguing that it contravened the canons of the Council of Nicaea. Although the Council of Chalcedon effectively ended the debate over Christ's nature in the west, Leo's successors were forced to contend with a resurgence of Monophysitism in the east.

Although Leo did maintain ties to the east after the Council of Chalcedon, even establishing a papal nuncio in Constantinople, most of his energy was devoted to events in the west. Italy suffered two major invasions during the 450s, and Leo took an active role in protecting the people of Rome. In 452 Leo met with Attila the Hun at Mantua and persuaded him to spare Rome and withdraw from Italy. When the Vandals attacked Rome in 455, Leo was able to persuade their leader, Gaiseric, to moderate their violence against the city. Leo's actions helped partially fill the power vacuum left by the ineffective western emperors and foreshadowed the wider social and political role that later popes would play in Rome and central Italy.

Pope Leo I. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. 136.

Leo was one of the most influential of the early popes. His declarations on papal authority, episcopal elections, and other topics were incorporated into medieval canon law. His statements on Christ's natures and person in the *Tome* became the standard for orthodox Christology, at least in the west. It should be noted, however, that Leo was not responsible for the so-called *Leonine Sacramentary*, which was probably compiled outside Rome in the sixth or seventh century. In 1754, Pope Benedict XIV declared Leo a doctor of the church. His feast is celebrated in the west on 10 November (formerly 11 April) and in the east on 18 February.

Leo III, Emperor

Leo III (Conon; c. 680—741, r. 717—741) was a Byzantine—i.e., eastern Roman—emperor. In older works he was mistakenly called "the Isaurian," but research has now established that he was from Germanicea (modern Marash or Maraş in southeastern Turkey). His native tongue was Syriac or Arabic, and as regards religion he was most likely a Jacobite (Syrian Monophysite).

Conon probably changed his original name to the more "Roman" Leo and became religiously orthodox when he joined the Byzantine army. As a young man he became a protégé of Emperor Justinian II during Justinian's second reign (705-711), and he continued to rise during the short reigns of emperors Philippicus (711—713) and Anastasius II

(713-715). When Theodosius III (715-717) deposed the latter, Leo marched on Constantinople to avenge Anastasius. With a large Arab land and naval force also approaching Constantinople, Theodosius voluntarily handed Leo the throne.

Leo's greatest achievement was to thwart the Arab siege of Constantinople in 717-718. Although the Arabs continued to be a threat, they never again endangered the existence of the empire. Also important was his promulgation of the *Ecloga*, the first Byzantine legal collection since the *Corpus iuris civilis* of Justinian I.

Leo's espousal of Iconoclasm, which condemned religious art, in 726 caused a revolt in those portions of Italy still under imperial control (Sicily had already shown signs of resistance early in Leo's reign). Tax increases imposed by Leo may also have been a factor in this revolt. Pope Gregory II—who lacked sufficient resources to withstand the Lombards and thus was still dependent on the Byzantines' military power—urged the Italians to exercise moderation, even though Leo (probably at about this time) removed parts of Illyricum from papal jurisdiction. Pope Gregory III, who was less conciliatory, also continued a limited cooperation with the empire; but by this time the popes were allies of the empire rather than its subjects. Leo may have caused some immigration to Italy from the empire's heartland, though this mainly occurred during the reign of his son. Refugees, many of them monks, augmented the existing Italo-Greek population—especially monastic communities—in Rome and central and southern Italy. Iconoclasm seems to have been little enforced in Byzantine Italy.

Leo III, Pope

Pope Leo III (saint; d. 816, r. 26 December 795–18 June 816) was involved in a dramatic episode that began in April 799. The ambitious nephews of the previous pope, Hadrian (Adrian) I, and their supporters attacked Leo in Rome, attempting to tear out his tongue and blind him. Though injured, Leo recovered and fled to Charlemagne at Paderborn. In November 800, Charlemagne arrived at Rome to investigate the matter. The charges against Leo are murky, but he was acquitted. He had taken an oath to prove his innocence—whether voluntarily or not is also unclear.

Charlemagne remained in Rome after Leo's trial. On Christmas day

800, Leo III crowned his supporter as "Roman" emperor in Saint Peter's church. The meaning of this ceremony is disputed. Charlemagne was a Germanic tribal chief—albeit a powerful one—not truly a Roman emperor. It is likely that he wanted to receive the imperial title from the Byzantine (eastern Roman) emperor, not from Leo, because coronation by the pope implied that Charlemagne was dependent on the papacy.

Leo again visited Charlemagne beyond the Alps in 804, perhaps to discuss the imperial succession. After Charlemagne's death, new plots broke out against Leo, but he succeeded in suppressing them.

Some historians consider Leo III a pitiful weakling; others consider him a decisive and farsighted statesman. His pontificate was undoubtedly characterized by close cooperation with Charlemagne on both religious and secular matters. Leo, who was a generous benefactor and builder, was canonized in 1673.

Leo IV, Pope

Pope Leo IV (saint; d. 855, r. January 847-July 855) had been cardinal priest of Santi Quattro Coronati and was famous for his oratory and his piety. Leo was one of the most assertive popes of his century. "Clever as a snake and innocent as a dove" (according to *Liber pontificalis*), determined to preserve Rome from hostile incursions and maintain the authority of the papacy, he molded ninth-century papal policy.

Christendom had been shocked by an Arab raid in August 846, when Saint Peter's and other sites outside the Aurelian walls were sacked. With financial help from Emperor Lothar I, who considered the Muslims a divine retribution for the empire's moral decadence, Leo organized the fortification of the suburb around Saint Peter's (finished by 853). The area became known as the "Leonine city," and its walls, modeled on Aurelian's third-century circuit, still stand. Leo also restored existing fortifications and churches in and around the city; planted an early-warning colony at the Tiber estuary; and in 854 inaugurated a new city, Leopolis, inland from Civitavecchia, which had been devastated. His ambitious building was encouraged when a Tyrrhenian coalition achieved a naval victory against Arab raiders in 849.

Leo's vision of the universal responsibilities of the bishop of Rome—a vision that is suggested by the range of his surviving correspondence—led him to confront Archbishop Hincmar of Reims. He cowed Hincmar, but not Anastasius, leader of a Roman clerical faction favoring subordination of the papacy to the empire. Anastasius, who was repeatedly excommunicated for canonical faults and was suspected of scheming to become pope, found refuge with Emperor Louis II. Leo intervened personally in places as far away as Ravenna to defend papal rights in the patrimony, which were endangered by insubordinate officials and clerics.

Leo's relations with Carolingian rulers were strained. He had been consecrated without the requisite imperial assent, and he tried to emancipate the papacy from Carolingian tutelage. But Leo was the first pope of his century to have an able imperial interlocutor—Louis II—resident in Italy, and this novelty affected his policies. Rumors that Leo planned an alliance with Byzantium brought Louis to Rome. After having reaffirmed the alliance between the papacy and the Carolingians, Leo died in July 855. The succession proved problematic. Leo's sanctity was upheld soon after his death, and *Liber pontificalis* lists his miracles.

Leo IX, Pope

Pope Leo IX (Bruno of Egisheim, saint; 1002-1054, r. 1049-1054) was born to a noble family in what is now Alsace-Lorraine. He became a canon at Toul in 1017. Although he was a deacon, in 1026 he commanded troops on behalf of his kinsman Emperor Conrad II (r. 1024-1039). In 1027, he was chosen bishop of Toul, where he promoted reform in the monasteries under his influence, particularly at Moyennoutier, Remiremont, and Saint Die.

In 1048, when Pope Damasus II died, Emperor Henry III (r. 1039-1056) promoted Bruno's election as Pope Leo IX. Bruno, who was at Worms when he was chosen, went to Rome dressed in pilgrim's garb and was canonically elected and enthroned there in 1049. In his entourage, he brought reformers to assist him, many of whom were from his home region of Lorraine. They included Frederick of Liège (later Pope Stephen IX), Hugh of Remiremont, Humbert of Moyennoutier, Udo of Toul, Halinard of Lyons, and Hildebrand (later Pope Gregory VII). As opportunity permitted, he appointed them cardinal bishops or cardinal priests of the Roman church, thus gradually strengthening the position of the reformers. Traditionally, the cardinal bishops had been primarily liturgical figures, helping popes carry out

the heavy burden of liturgy in Rome. Leo contributed to a process by which the cardinals became the chief assistants of the pope by using them as legates, officials, and advisers. Within a generation, the cardinal bishops—joined by the cardinal priests and cardinal deacons—had become a central organ of papal government. The more efficient governing structure helped to free the papacy from the long-standing control exercised by the Roman nobility and the German kings.

Since the tenth century, church reform had been stirring in several independent European centers, spurred by some monks, canons, bishops, and lay rulers, but their efforts were uncoordinated and spasmodic. Leo's accession to the papacy in 1049 had important consequences for the reform movements. Leo was an active member of the reform party, and during his pontificate he set the papacy on a new course of vigorously supporting, indeed leading, the reforms that were so prominent in the eleventh century. Leo's pontificate was energetic and focused on three main issues: the moral reform of the clergy, the protection of papal territory from the Normans in southern Italy, and the relations of the papacy with the Byzantine church.

Leo had an exalted concept of papal authority, but he was on amicable terms with his patron, the pious young German ruler Henry III, who also supported the moral reform of the clergy. Leo's reforms were directed primarily at the clergy and generally did not threaten the interests of lay rulers. Unlike his generally sedentary predecessors, Leo traveled widely in Italy, France, and Germany, and even as far east as Hungary; he spent only about six months of his pontificate in the city of Rome. Under Leo, the papacy—which for more than a century and a half had been a distant and relatively passive, though revered, institution—became a more active force in church affairs. Leo summoned about a dozen synods to condemn simony, clerical marriage, and other practices offensive to the reformers.

Since the early eleventh century, adventurers from Normandy had been invading southern Italy, seizing Saracen, Byzantine, Lombard, and papal territories. Leo hoped for an alliance of the papacy, the German empire, and the Byzantine empire to check the Normans' expansion. Before he could arrange such an alliance, he and his small band of troops were defeated by the Normans in June 1053 at Civitate, and he was held in honorable captivity for about six months. Leo's aggressive

policy toward the Normans failed; when it proved impossible to dislodge the Normans, succeeding popes changed course and made alliances with them.

The revival of the papacy led to a growing insistence that all Christians, including those in the east, acknowledge the preeminent position of the pope within the church. Leo sent Cardinal Humbert of Silva Candida, one of the more radical reformers from Lorraine, as a papal legate to Constantinople to arrange an alliance with the Byzantines against the Normans. Humbert was an ardent supporter of papal claims to primacy over the entire church, and he insisted that the Byzantines acknowledge this primacy as well as papal territorial claims. Michael Cerularius, the patriarch of Constantinople, was a committed opponent of papal authority, and a clash was inevitable. Humbert excommunicated Cerularius and his supporters on 16 July 1054, and in the same month Cerularius excommunicated the papal legates. The mutual excommunications opened a schism between the Roman and Byzantine churches that lasted until the twentieth century. Leo IX had already died, however, when this break with Constantinople occurred.

Leo was a pivotal figure in the history of the church. With his election, the reform party gained control of the papacy, and during his pontificate reformers solidified their position within it. He was an activist who won for the papacy a position of leadership in reform. Within two decades, Leo's proposals for the moral reform of the clergy had widened into an ambitious effort to free the church at every level from lay control—the so-called Gregorian reform, identified with Pope Gregory VII (r. 1073-1085).

Leo IX died on 19 April 1054 and was buried in Saint Peter's basilica. He was canonized in 1087 by Pope Victor III.

Lewis of Bavaria

Lewis (Louis, Ludwig, Emperor Louis IV; c. 1282 or 1287-1347) was the son of Duke Lewis II Wittelsbach of upper Bavaria and the Habsburg princess Mechthild. The younger Lewis defeated a Habsburg invasion of Wittelsbach territory at Gammelsdorf in November 1313 and claimed victory in an irregular election for the German kingship against his cousin Frederick Habsburg in 1314. Lewis was crowned in Aachen—by an untraditional party, the archbishop of Cologne, and with bogus insignia—on 25 November 1314. This dispute resulted in an eight-year war, which ended with Frederick's defeat on 28 September 1322 at Muehldorf, and his subsequent imprisonment.

Secure in his imperial claim, in 1323 Lewis sent his marshal, Berthold von Neiffen, to Italy to assert his authority there. Both the claim and this action angered the Avignonese pope John XXII, who had been

supporting the Guelfs' efforts against the Ghibellines in Lombardy. Berthold aided the Milanese Visconti and the della Scala of Verona; John responded by charging Lewis with presuming powers and authority and aiding heretics (the Visconti), and demanded his presence in Avignon. Lewis defended his actions and authority, refused to attend the pope, and was excommunicated on 23 March 1324. On 11 July, John solemnly deposed Lewis, who decided that Italy and the imperial crown were the keys to outmaneuvering the irascible and hostile pope.

In January 1327, after two years of careful preparation in Germany, Lewis met with Ghibelline leaders in Trent. As Lewis proceeded toward Milan, Pope John demanded that he leave Italy and excommunicated several of Lewis's attendants, including the radical philosopher Marsilius of Padua. In Milan on 31 May, two excommunicated bishops crowned Lewis king of the Lombards. Dissatisfied with the rule of the Visconti in Milan, on 7 July Lewis deposed Galeazzo Visconti and imprisoned him and his brothers Marco and Luchino. Milan received a new government under an imperial vicar and made a "gift" of 50,000 gold florins to the king. Lewis also granted Castruccio Castracani control over Lucca, Luni, Pistoia, and Volterra, but denied him the lordship of Pisa.

Lewis entered Rome on 7 January 1328 and, probably under the influence of Marsilius, played grandly to the Roman people. On 17 January, two excommunicated bishops consecrated Lewis, and Sciarra Colonna, a representative of "the people," placed the diadem on his head. Lewis formally declared John a heretic and presumed to deprive him of all his ecclesiastical offices (14 April), and on 12 May Lewis himself crowned the Franciscan Pietro Rainucci as the antipope Nicholas V. According to the chronicler Villani, the new antipope recrowned Lewis emperor on 22 May. The Avignonese pope—John—again formally condemned the emperor and supported Castruccio's takeover of Pisa. Neapolitan Guelf troops captured Anagni and Ostia, near Rome, and on 4 August 1328 Lewis and his antipope left Rome in the midst of a jeering crowd.

Moving north, Lewis unsuccessfully attacked Grosseto but wisely avoided the Guelf stronghold of Florence. He returned to Pisa and ousted the Castracani from there and from Lucca. Lewis renewed his "sentence" on John and named Azzo Visconti vicar of Milan. Azzo soon

turned on Lewis, who left Pisa (11 April 1329) to attack Milan. This attempt failed, and Lewis confirmed Azzo, although Azzo—along with the d'Este and the Pisans (who soon incarcerated the antipope, Nicholas)—supported John. The emperor then abandoned Nicholas but gave the vicariate of Mantua to Luigi Gonzaga in an attempt to strengthen the Lombard Ghibellines. December found Lewis in Trent, and in February 1330 he recrossed the Alps.

Although on at least two occasions Lewis threatened to return to Italy, he never did so. The emperor continued to struggle with the Avignonese popes and their allies the French kings, eventually supporting Edward III of England in the Hundred Years' War. Lewis died while hunting near Munich on 11 October 1347 and was buried in Munich, but his remains have since disappeared.

Liber Pontificalis

Liber pontificalis—"pontifical book"—is the name now universally given to a series of papal biographies spanning the history of the see of Rome from Saint Peter to the fifteenth century. This name first appears in ninth-century manuscripts of the text, but it was little used until Duchesne (1886) adopted it in his celebrated critical edition. Originally, the list of popes' lives went by other names, if any: *The Episcopal*; the *Catalogue*, or *Order, of the Popes*; and *Gesta* (i.e., "achievements") *of the Bishops of Rome*.

Abbot Duchesne's Herculean toils made the first reliable text of *Liber pontificalis* available to scholars in the 1890s. Unlike earlier editors (the *editio princeps* dates to 1602), Duchesne examined a large number of manuscripts. Even Mommsen, whose incomplete edition (1898) appeared shortly after Duchesne's, said that he was only confirming the validity of Duchesne's readings. The assorted texts that are today considered "the *Liber pontificalis*" never circulated as a coherent book presenting an uninterrupted papal history until Duchesne's edition. The present *Liber pontificalis* is thus virtually Duchesne's creation.

Duchesne also initiated scholarly discourse on *Liber pontificalis*. The introduction to his edition remains an indispensable guide to the text. Duchesne's reconstruction of how the *Liber* was composed still holds the field, especially outside the German-speaking world (where Mommsen's early seventh-century date for the first redaction finds some favor). Following Duchesne, most students believe that the first redaction of the *Liber* was written just after 530 by someone with firsthand knowledge of the events described after 496. The compiler of c. 530 used older lists of pontificates, on which he embellished. His writing was a retort to the enemies of Pope Symmachus (d. 514), who had generated a papal history hostile to Symmachus (part of it survives as the "Laurentian fragment").

Whether a new papal biography was appended to the redaction of 530 at each pope's death thereafter is less certain; Mommsen thought not, suggesting that the custom of updating the *Liber pontificalis* after each pontificate caught on late in the seventh century. Arguments on the contemporaneity of the biographies between 530 and 687, and on the dating of later redactions, are inconclusive. They are complicated by the garbled manuscript tradition; this seems to bifurcate around 640, when a new edition of the text may have been divulged. From the pontificate of Conon (d. 687) to that of Stephen V (d. 891), contemporaries wrote the biographies, some of which (such as the life of Gregory II) circulated before the protagonists had died. After 891 only brief notices were written, generally not long after the death of the pope. In the twelfth century various authors added to *Liber pontificalis*, fleshing out the post-1073 biographies. The many continuations written in the thirteenth, fourteenth, and fifteenth centuries were not "official" biographies by nameless papal bureaucrats; rather, their authors, whose

identities are known, often were private researchers, tenuously connected with the papacy.

Between the sixth, and ninth centuries the *Liber pontificalis* was a living text, regularly updated and presenting an almost official account of papal affairs. However, some biographies are fuller and more reliable than others, and several ninth-century lives were left unfinished. In general, the anonymous compilers were familiar with the popes they described. These compilers were educated, well-informed Lateran officials, though not men of the highest rank with access to all the secrets of the *patriarchium*. Their concerns were Roman and clerical; seldom do non-Roman or even secular Roman affairs receive notice in *Liber pontificalis*.

From the sixth century to the ninth, the sources of the successive biographers included eyewitness accounts and Lateran gossip, material which the writers integrated with the written sources also available to the later continuators or to the author of 530. Among the written sources were inscriptions, hagiography, liturgical and canonical texts, archival records, and account books. The biographers doctored their data, presenting a politically viable version of the popes' deeds in skillfully chosen words. The careful phrasing of certain biographies reveals that they were amended, sometimes heavily, after the original redaction, as political expediency dictated. Such correction was not always possible, however; the life of Benedict III (d. 858) contains information damaging to Anastasius, who worked on *Liber pontificalis* in the mid-ninth century and was hence well placed to alter the text. Anastasius's failure to amend the text indicates that by the mid-ninth century the diffusion of *Liber pontificalis* was swift enough to inhibit would-be censors.

The Latin of the biographers was restrained and standardized, but some added picturesque touches to the narrative and used a more colorful vocabulary. The authors of *Liber pontificalis* followed fairly rigid compositional rules during the period of its heyday (530-891) and even in the twelfth century. The recipe first used c. 530 became normative, so a proper papal biography proceeded with an orderly listing of each pope's name, number, family, origin, date and length of pontificate, special deeds, disciplinary decrees, patronage distributed, ordinations conferred, time of death, and burial place. The length of the

subsequent vacancy also was recorded. The formulaic nature of the biographies did not prevent their compilers from including much individualized detail (though there was less such detail in the seventh century). These details permit the reconstruction not only of each pontificate's peculiarities, but also of Rome's economic, social, cultural, and topographical development; they also illuminate Roman politics during various otherwise murky periods. The original function of *Liber pontificalis*, instead, may have been as a reference manual of local church history, or as a textbook for neophyte officials within the Lateran. It was also used as an instrument of papal propaganda abroad.

Begun during the sixth -century revival of the classical genre of biographical series, the *Liber pontificalis* enjoyed great popularity throughout the Middle Ages, when the genre was less in vogue. Both Gregory of Tours and Bede seem to have known the text (or parts of it), but the wide diffusion of the *Liber* came only during the Carolingian age. Numerous Italian and European bishoprics then provided themselves with lists of episcopal biographies, loosely imitating the Roman model. None of these episcopal *Gesta* had the longevity of *Liber pontificalis*; they were composed once and for all and were not updated thereafter. The *Gesta* resembled the *Liber* in form and in their attempt to create the impression of an unbroken, continuous series of episcopates reaching back to apostolic times, linking the present to a glorious local past.

Liberal Arts

As the principal system by which knowledge is organized and transmitted through education, the liberal arts remain among the most durable contributions of antiquity to western civilization. The Greeks first delineated propaedeutic training designed to prepare the individual for participation and competition in a society where education provided an initiation to cultural ideals. Although components of a coherent body of knowledge intended to organize human experience of the world were to vary with time and place in Greco-Roman antiquity, the *artes liberales* would remain the philosophical core of the educated mind. The term *ars* (Greek *tekne* or *techne*) indicates that techniques or skills are associated with each area of cognition; it likewise implies an individual's ability to pursue activities of the mind liberated from physical labor and ignorance. Defined perhaps as early as Pythagoras, and subsequently refined by Dionysius Thrax, Varro, Boethius, and Cassiodorus, the *artes* were divided into two major groups: those concerning the acquisition, correct usage, and expression of language in oral and written communication; and those related to calculation and quantification. Grammar, rhetoric, and dialectic made up the trivium; arithmetic, geometry, astronomy, and music made up the quadrivium.

Although the liberal arts in medieval Italy retained their Hellenistic formulation, their evolution differed—significantly in some instances—from that in other parts of Europe. As one of the final triumphs of Greek science, *an grammaticae* was naturally the first course on any curriculum. The earliest Latin treatise may be attributed to Varro; but the *Ars Major* and *Minor* of Donatus and the *Institutiones grammaticae* and *Praeexercitamina* of Priscian were most widely disseminated until the late twelfth century. In Martianus Capella's transitional *De nuptiis Philologiae et Mercurii*, acclaimed as the foundation of the medieval

trivium and quadrivium, Lady Grammar carries an elaborate box containing the tools of her art, explaining that in the past her instruction was limited to reading and writing correctly, but she must now also teach textual comprehension and analysis. Claiming to share the latter two with philosophers and critics, Lady Grammar distinguishes between the active skills of reading and writing and the more contemplative nature of analysis and interpretation.

Medieval grammar, of considerably greater breadth and depth than its modern counterpart, began with instruction in letters, syllables, parts of speech, pronunciation, orthography, etymology, morphology, and syntax. In early Christianized Italy, a child's introduction to the liberal arts typically began around age seven, often, though not necessarily, under the direction of a cleric. Throughout the Middle Ages, there was more secular education in Italy than elsewhere. In a culture whose principal authority was "the Word" and "the Book," the liberal arts provided an introduction to the study of philosophy, considered the highest realm of human learning. Thus, grammar courses involved extensive experience with Christian texts. Lessons were frequently based on passages from scripture and proceeded from detailed examination of the *littera* to exegesis and exercises in composition. Essentially utilitarian in its methods, such pedagogical grammar is distinguished from the more scholarly approaches of speculative, theoretical grammar associated with modern linguistics and philosophy of language.

Questions concerning the propriety of exposing ingenuous minds to non-Christian *anctores* varied with time and place; the final resolution favoring inclusion followed the recovery and translation of Aristotelian texts, the significant influence of Arabic learning in Italy, and the Thomistic reconciliation of ideologically opposed cognitive systems. In Padua, the first of the proto-university *studio*, based on the Bolognese model, masters of grammar are in evidence from the early twelfth century. Rolandino—Padua's first major historian and a student of Buoncompagno da Siena—taught grammar and rhetoric from the establishment of the *studium* in 1222 for more than fifty years; in the period 1222-1350, more than thirty masters of grammar and rhetoric taught in Padua, where the more recent texts of Alexander da Villa Dei and Eberhard de Bethune were probably in use.

Ars rhetoricae (from the Greek orator') assumed a mastery of correct Latin usage; this discipline taught oral and written expression heightened in effectiveness by persuasive eloquence. A tripartite generic division (fourth century B.C.) remained in use: judicial, for forensic argumentation; deliberative, for determination of action where opposing options were under consideration; and epideictic-demonstrative, for expression of praise or blame. Although rhetoric flourished in Roman Italy with Cicero, the pseudo-Ciceronian *Rhetorica ad Herennium*, Horace, and Quintilian, among others, its functions in medieval Italy were largely associated with the study of law, the *ars dictaminis*, arts of poetry, and *ars praedicandi*.

The Justinian codification of Roman law and the revision of law school curricula were early indications of the prominence of legal study in Italy from the founding of the first *studium* in Bologna (1135) to schools in Modena, Reggio, Vicenza, Arezzo, Vercelli, and Piacenza, among thirteenth-century sites in the region. Independent at their establishment, the faculties of law generally retained administrative autonomy from other arts faculties. For the *genus iudiciale*, rules prescribed most organizational aspects of legalistic discourse, beginning with Aristotle's five-part division: invention, disposition, diction, delivery, and memory.

Ars dictaminis played an important role in the development of Italian rhetoric. It developed within an ecclesiastical and political culture where elegant epistolary expression was highly regarded, and its early masters were Buoncompagno da Siena (c. 1165-c. 1235), Bene di Firenze ((1. 1220), and Guido Faba (c. 1190-c. 1240). Guido's *Summa dictaminis* is more practical than theoretical, offering a large selection of readily adaptable models on a variety of subjects. Such tracts typically focus on organization, the importance of lexical choices, levels of style, and types of ornamentation (*colores rhetorici*).

Whatever the context, an *exordium* should render the audience docile, i.e., teachable; it should also please and stir the emotions. The latter two methods of persuasion—pleasure and emotion—were controversial for Augustine and other Christian rhetoricians; in addition to extensive Augustinian discussion, Fulgentius's *De continentia Virgiliana* is among the first instruction manuals on Christian rhetoric. After his conversion, Augustine was to deplore his

career as a professor of rhetoric, proposing modesty of style with an authorial and oratorical emphasis on substance; but Fulgentius represents another kind of early medieval rhetoric in his allegorization of the *Aeneid* as a narrative depicting the trajectory of human life. With John of Garland, Matthew of Vendome, and Geoffrey of Vinsauf, treatises on the art of poetry became central to medieval rhetoric. Geoffrey, in Rome during the papacy of Innocent III, published his *Poetria nova* c. 1210. Central to the case for vernacular rhetoric is Dante's *De vulgari eloquentia*.

Wherever persuasive language is required, dialectic provides essential techniques for the structuring of argument. As the third art of the trivium significantly indebted to *translatio studii*, logic (and its derivative art, dialectic) became increasingly important in medieval Europe, especially in Paris following the recovery of the remaining texts of Aristotle's *Organon*. Boethius, who was central to the commentary tradition and the transmission of ancient texts, identifies dialectic as one branch of logic intended to produce probable, though not necessary, truth in problems and propositions. Applicable to all the other arts and to virtually any subject, the dialectical syllogism and *quaestio* became primary instruments of medieval *disputatio*. Aquinas honored dialectic as *ars artium* ("the art of arts"); his *Summa theologiae* is considered the culmination of the scholastic tradition, particularly where he offers a five-part proof of the existence of God. To the quodlibet whether the libera! arts should be taught relative to such worldly activities as commerce, Aquinas responds that the essentially spiritual nature of the arts must be respected by those who teach.

All die arts of the trivium are inextricably interrelated and are a preparation for the mathematically based quadrivium, whose four ways lead to comprehension of order in the universe (numerology is likewise related to medieval aesthetics). *Ars arith- metica*, unlike its modern counterpart, addressed primarily theoretical aspects of number, unity, equality, ratio, and proportion. Nonetheless, some instruction would be useful, if not necessary, to the merchant, artist, sculptor, and architect, and even the mason. Early Pythagorean concepts of arithmetic were maintained throughout the Middle Ages, with a distinction being made between arithmetic and arithmology, pertaining to mystical properties of numbers. According to the *De arithmetica* of Boethius:

It is prior to all not only because God, the creator of the massive structure of the world, considered this first discipline as the exemplar of His own thought, and established all things in accord with it; or that through numbers of an assigned order all things exhibiting the logic of their maker found concord; but . . . because whatever things are prior in nature, it is to these underlying elements that the posterior elements can be referred.

Addressing number theory, called "separable multitude," Boethian arithmetic developed a cognitive methodology that proceeded from number in itself to relativity between two numbers and, finally, between three numbers.

The recovery of Aristotle's *Physics* and *Metaphysics* stimulated research and teaching in disciplines applicable to medicine and law, whose Italian university faculties were known throughout the world. Also critical was the introduction of sources such as Al-Khwarizimi's *Treatise on Calculation with Hindu Numerals*, translated c. 1143; its computational system provided the basis of algorism, leading to the Italian treatises of Alexander Villa Dei and Sacrobosco in the following century. Sacrobosco's *Algorismus vulgaris* was the first text to introduce practical mathematics to the university curriculum; a commentary on it by Peter of Decia appeared in 1291 and remained in the standard arithmetic curriculum for centuries.

The court of Frederick II Hohenstaufen and the first university established by civil charter, which he founded in Naples, brought together scholars and translators from virtually every known cultural tradition. Treasures of Arabic, Hebrew, and Hindu knowledge were translated by men such as Burgundio of Pisa and James of Venice. Under Frederick's decree, a medical student was required to have three years of logic before concentrating on the mathematical sciences. A notable case is Thomas Aquinas, who began his study of liberal arts at Monte Cassino and later pursued logic and the natural science in Naples. By the thirteenth century, Greek mathematical tracts stimulated important work by Jordanus Nemorarius and Leonardo Fibonacci da Pisa, among the most outstanding mathematicians of the Middle Ages.

According to a mnemonic poem, *Ar numerat* while *Ge ponderap*. it literally, at least, measures the earth. Thus, Martianus Capella's *Lady Geometry* carries a ruler or compass in one hand and a globe in the other. Euclid and Archimedes remained primary sources throughout the

medieval period, although no complete translations of Euclid were available until after 1150, and translations of Arabic texts contributed significantly to medieval geometry. In its most developed form, a geometrical proposition bears a more than passing resemblance to its dialectical counterpart: enunciation of the problem, statement and specification of the problem, construction of argument, proof, and conclusion. As a transmitter of Euclidean geometry, Varro remained the primary authority until Boethius and the late Latin encyclopedists Cassiodorus, Martianus, and Isidore; the translation by Campanus di Novara (thirteenth century) circulated widely. Hugh of Saint Victor's *Practica geometriae* differentiated between theoretical and practical approaches; Hugh then subdivided practical geometry into *altimetria*, measurement of height and depth; *planimetria*, measurement of plane surfaces; and *cosmimetria*, measurement of the world itself. The combined theories of Hugh and Dominicus Gundissalinus formulated three areas of geometry: theoretical-mathematical, taught in liberal arts schools using tracts by Jordanus Nemorarius; practical, likewise a school subject but used also for surveying and measuring; and constructive, useful in the building projects that proliferated in Italy from the eleventh century on. Among later medieval efforts to apply Euclidean geometry to philosophy, as well as to practical uses, Leonardo Fibonacci da Pisa should be noted.

Although astronomy had been the most highly developed of the sciences in Greece, it was of less interest to the more pragmatic Romans, and thus was transmitted to the Middle Ages incompletely and often incorrectly. Much of later medieval astronomy drew on Greek sources recovered through Arabic scholarship. Of Platonic theory, only the *Timaeus* survived. The Euclidean theory of spheres was adapted and modified by Aristotle in his *Metaphysics* and *On the Heavens*. Fourth among major theorists for the Latin Middle Ages, Ptolemy of Alexandria formulated the most widely recognized systemization of the *ars astronomiae* in his *Almagestes*, transmitted partially by Macrobius (*Commentary on the Dream of Scipio*), as well as by Calcidius (who was also a translator of and commentator on the *Timaeus*) and Martianus Capella. Partly owing to the praise of Copernicus, the eighth book of Martianus's *De nuptiis* was widely taught until c. 1000; it is of particular interest for its claim (not original) that the earth was not at

the center of the sun's orbit.

The connections between astronomy and other *artes liberales* made it of primary importance to many quadrivium scholars: to cite but two examples, a new genre of astronomical tract known as *computus* appeared in the seventh century to calculate the date of Easter; and the astrolabe, reintroduced through Arabic transmission, served for centuries to determine celestial altitude, tell time, and measure depth and height. A respected work on the astrolabe was written by Gilbert de Rheims, who became Pope Sylvester II and was known for his erudition in all seven arts. At the universities of Bologna and Padua, astronomy flourished, partly owing to Averroistic works such as the *Expositio super theoricam planetarum* of Taddeo da Parma (fourteenth century). Controversy arose concerning Pietro d'Abano, who had studied in Constantinople and Paris; in his *Concililator* and *Lucidator* he developed a philosophy of medicine linked to astrology, claiming that illnesses of the microcosmic human body cannot be adequately treated without reference to Ptolemaic cosmology.

Music—last in the canonic medieval configuration of the liberal arts—was conceived from early Pythagorean theory in terms of measurement and order (Plato had said that the soul of the universe is united by musical concord). For the Greeks, it was principally a *techne* of numerical laws, whose major divisions were harmonics and rhythm. Theorists until the Christianization of Italy reiterated similar concepts. In Boethius, music was defined as the science of skillful modulation involving reason and the senses; Augustine and virtually all subsequent medieval churchmen emphasized the unique ability of music to arouse emotion. A passage in Augustine's *Confessions* (10.33) expresses his ambivalence even toward music set to sacred texts: "I feel that by those holy words my mind is kindled more religiously and fervently to a flame of piety because I hear them sung than if they were not sung." In Martianus's *De nuptiis*, Lady Harmony demonstrates the dual capacities of music: she appeases the dissonance threatening the celebration and restores order by leading Mercury and Philology to the bedchamber.

The study of arithmetic and at least some acquaintance with geometry and astronomy were appropriate prerequisites for the medieval student; even a rapid overview of Martianus's text reveals the complexity of music theory as it entered the Middle Ages. For

centuries, *skolae cantorum* apparently assumed the principal tasks of teaching. The first official schools on record were established in Saint Gall and Metz. An indication that the more practical aspects of performance were worthy of consideration can be found in an important tract by Guido d'Arezzo (c. 990-1050), whose solmization system facilitated instruction in plainchant melodies. In the early fourteenth century, treatises by Johannes de Muris and Philippe de Vitry introduced *an nova*, which was later to influence Italian *nuova musica*. By 1324, the Avignonese papacy, concerned by the influence of this new music, issued a decree restricting the presentation of music in churches; this document has been seen as a stimulant to secular troubadour-*trouvère* compositions, which were already proliferating. Until the fifteenth century, Avignon was to remain the central source of liturgical polyphony.

Libri Carolini

The *Libri Carolini* was the response of Charlemagne's court to the decisions of the Council of Nicaea (787), summoned by Empress Irene to legislate the end of Iconoclasm. Having received the council's acts in a Latin translation sent by Pope Hadrian I, whose legates had participated in the council, Charlemagne commanded Theodulf of Orleans, advised by others at court, to prepare a rebuttal. The treatise amassed an array of authorities to demonstrate that the council's position on the use of images represented dangerous doctrinal innovations and to define what tradition had established as orthodox teaching. Interspersed with the theological discussion was a wide-ranging polemic against the claims of the imperial office to define orthodoxy and the legitimacy of the council's ecumenical status without representation from the Frankish church. The *Libri Carolini* marked an important step in the growing consciousness at Charlemagne's court of the role of the Franks as God's chosen defenders of Christendom.

Licosa, Battle of

The battle of Licosa took place in 846. Southern Italian states had begun employing Islamic mercenaries against each other in the 830s. These mercenaries often took to independent looting and kidnapping, creating permanent bases (*ribat*) on the Italian mainland. In the 840s the diminished threat from rival cities such as Benevento and Salerno, and an intensification of Muslim raids, enabled the dukes of Naples to form a coalition of states against the marauders. This "inspired alliance" (*Vita Sancti Antonini*) among Amalfi, Sorrento, Naples, and Gaeta sought to protect the shipping of the Tyrrhenian ports. In the spring of 846, a mopping-up operation directed at Muslim bases on the Campanian coast culminated in the allies' capturing the stronghold on the promontory of Licosa. The benefits for Campania proved transitory—after 851 the pirates returned to looting the divided south—but the league that Naples led at Licosa (and in other naval operations as late as 849) demonstrated the potential of the maritime city-states acting in unison, even without aid from the Byzantines.

Lippo Memmi

See Memini, Lippo

Lippo Pasci De' Bardi

Lippo Pasci (or Paschi) de' Bardi (late thirteenth century-early fourteenth century) was a Florentine poet, and perhaps a musician, who wrote four sonnets (contained in the Vatican Codex Lat. 3214) and to whom Dante addressed a sonnet, *Se Lippo atnic se' tu che mi leggi*. Virtually nothing is known about Lippo's life, although he has been proposed (Di Benedetto 1941) as the possible author of the allegorical poems *Il Fiore* (long attributed to Dante) and *Intelligenza*. On the basis of stylistic similarities, Lippo has also been identified as the anonymous "Amico di Dante" ("Friend of Dante"). From archival documents, we

know that Lippo was active between 1292 and 1312 and died before 1332.

Lippo is best-known through the sonnet addressed directly to him by Dante. In this sonnet of correspondence, Dante refers to the accompanying stanza of an ode (probably *Lo meo servente core*) as a *pulcella nuda* ("unadorned maiden") which he is sending to Lippo in order that Lippo might "clothe it" (*La rivesta*). However, Dante's intention is unclear: he may want Lippo to set it to music, or to provide a commentary for it, or simply to copy it in more elegant handwriting. Recent philological criticism has argued that there is confusion between Lapo (Gianni) and Lippo in the textual tradition of *Guido, i' vorrei che tu e Lapo* [or *Lippo*] *ed io*, a well-known sonnet by Dante. If this is the case, major questions of interliterary relations in the late *Duecento* will have to be reconsidered and revised.

Liturgy

More than perhaps any other European country, Italy was the home of rites and Uses in great number, some of them quite local and exhibiting

considerable differences. Comparative studies of these different uses have barely begun, and no methodology for accomplishing the task has been established. Complicating the process, too, is our incomplete knowledge of many of the Uses known to have existed, even though some of them are of great importance. The gaps are unlikely to be filled, because either the books are lost or they are late and heavily Romanized to eliminate their idiosyncracies.

Certain kinds of books seem to have survived (perhaps for reasons other than liturgical), whereas those that could inform us more generally about liturgical texts and practices are scarce. This state of affairs is especially true before the eleventh and twelfth centuries, when the drive to exert the influence of Rome and to establish some conformity of tradition grew in force. Evidence for liturgies before this time must often be gleaned principally from sacramentaries, ordines, gospel books, *legendae*, and specialized documents such as *exultet* rolls. Only in liturgies such as the Benevantan and Ambrosian do books of other kinds survive in greater quantities. Books for the mass, missals, and graduals and their prototypes are about twice as common as books for the offices.

Even in the later Middle Ages, liturgical books in Italy seem scarcer than those in England, France, and Germany, perhaps as a result of the humanists' disdain for all things medieval and of the suppression of ecclesiastical institutions—and perhaps also because the notoriously inaccurate or inadequate cataloging of liturgical books has hardly been addressed in Italy. In addition, surviving books of the later periods seem different in character from those elsewhere. Large books for the choir, *chorali*—often preserved, one imagines, only because of their beautiful art-work—exist in Italy (and to some extent in Spain) in much larger quantities than in more northern countries. A further difficulty lies in the often widely discrepant dates for some of the major sources of Italian liturgy, where differences of a hundred years or more are not uncommon. It is hard to know how to assess the importance of these obvious differences and defects in the source material.

The bibliography for most of the topics to be discussed is huge, often relatively dated, and usually quite specialized. The most recent work from which a synthesis can be extracted is musicological: some of the following summary is abstracted from Hiley (1993), which, although

dealing with chant across Europe, makes possible to some extent the isolation of Italian trends and deals to some extent with nonmusical books, Hiley's work also contains a vast bibliography in which the important works are recorded. Other recent musicological work has also illuminated the problems of Old Roman and Roman usage, and of the Ambrosian and Beneventan rites. Many of the sources most easily accessible or best-known are chant books. Reliance on information oriented toward chant research is obviously no substitute for comprehensive evaluation, although each of the musical studies is careful to place its repertoire within the general liturgical context as far as possible.

This general survey of Italian medieval liturgy will address the topic from a variety of aspects and will begin with a chronological overview of the political developments, in which the role of Rome will be prominent. A review of the liturgical influences on Rome, including the role of the popes and papal rites, will then be discussed; following are briefer sections organized by geography.

The Development of Liturgy in Rome

For the first two centuries of the Christian era, the bishops of Rome were Greek-speaking, and Greek was the language of liturgy up to the fourth century. But "nothing survives of the Roman liturgy of the first five centuries. . . . There was considerable liturgical activity but we have no way of evaluating either its extent or its results" (Vogel 1986). From the fourth century on, with a few exceptions during Holy Week, the language was predominantly Latin, although in the seventh century the liturgy was again partly bilingual because eastern Christians were flocking to Rome (between 638 and 772, nine of the twenty-five popes were eastern). Eventually, the influence of the reforms of the Frankish church in the eighth and ninth centuries established Latin as the principal language.

The authority of Rome was variously circumscribed until the very late Middle Ages, often as a result of political rather than ecclesiastical circumstances. Byzantine rites held sway in the south. As a center in the early period, Rome was less important than Constantinople, or even

than Milan or Ravenna—Ravenna being the capital of the Byzantine exarchate from 540 to 751. Except in the north, the writ of the bishop of Rome ran in much of the rest of the peninsula until the Lombard invasions of the late sixth and seventh centuries. The Lombards were in the south by 570, confining the Byzantines to Calabria and Sicily and isolating the coastal region from Rome to Naples. In the eighth century, the conquest of northern Italy and Ravenna by the Franks changed the political situation yet again, further diminishing the influence of Rome.

The period from the sixth century to the eleventh century was one of decadence and decline in which Roman traditions lost their power. The center of influence had moved to Gaul and Germany. During this period, the liturgy of the city of Rome and the papal court was systematized, and there was a gradual mixing of Frankish and Roman uses.

Several factors contributed to the recovery, beginning in the tenth century and more strongly in the eleventh century. The first was the introduction into Rome, almost certainly during one of several visits there by Emperor Otto I from 951-972, of the Roman-German Pontifical (liturgical book). This is said to be one of the major events in liturgical history. Other changes came about as a result of the foreign popes who were installed when Emperor Otto III was trying to reform the papacy around the turn of the tenth century: Gregory V (r. 996-999) was German; Sylvester II (r. 999-1003), French. German clerics—from Augsburg, for instance—were appointed to Italian churches, especially in the north. Gregory V demanded a regular supply of liturgical books from the *scriptorium* at Reichenau: like the Roman-German Pontifical, these would have been German in character. Gregory VII is reported to have said *Teutonicis concessum est regimen Ecclesiae nostrae*.

Perhaps the most significant political change was a result of the Norman invasions of Sicily and the southern mainland in the eleventh century. The city of Bari was captured in 1071, and eventually the kingdom of Sicily controlled by the Normans extended up the peninsula and along the eastern coast beyond Rome. Although the liturgical implications for the region are by no means clear, it seems likely that the Normans' predilection for monastic patronage allowed Monte Cassino again to play a leading role in the renewal of Roman liturgical practice.

Eventually, Rome seized the initiative, trying to end German control of ecclesiastical affairs. Although its influence remained strong for some time, the Roman-German Pontifical eventually became an *Ordo Romanus*: it was adapted to Roman use, and unnecessary rituals such as royal coronations were removed, along with archaic rituals and the luxuriant overgrowth of German texts. This process was one of simplification in which the substance of the services was unchanged.

Evidence of a renewal of political authority came with the Lateran Council of 1123. But the first evidence of a distinctive liturgical authority appears only in the thirteenth century as a result of the reforms of Pope Innocent III (r. 1198–1216). The exile of the papacy in Avignon in the fourteenth century rendered Rome once again impotent as a liturgical center, until the fifteenth century.

Liturgical Influences on Rome

In the broadest terms, some liturgical developments influencing Rome and the liturgy originated in the fifth century. Monastic communities of this period attached themselves to basilical churches such as the Lateran and Saint Peter's. These perhaps played a role in the formation of the rule of Saint Benedict. That rule, also influenced by earlier, less well-developed compilations, was put together in the early sixth century for the community of Benedict at Monte Cassino. It enables us to reconstruct fairly comprehensively monastic liturgies from that time. Nothing similar exists for secular liturgies until the seventh century, and as far as can be determined, the distinction between monastic and secular use was not clearly defined in Rome. But churches of Rome were staffed by monks in the sixth and seventh centuries.

Various popes during these centuries are credited with liturgical reforms or additions to the liturgy. Gelasius (r. 492-496) perhaps introduced the Kyrie to the mass; Symmachus (d. 514) perhaps added the Gloria. Gregory I (r. 590-604), although no longer credited with the composition or even the compilation of plainsong (both of which attributions are of much later date), was probably responsible for reorganizing liturgical administration and regulating liturgical use. Masses for the Thursdays of Lent were arranged during the pontificate

of Gregory II (r. 715-731). Numerous other popes or abbots are said to have edited or ordered the cycle of chants for the church year. Apel (1958, 38-42) gives convenient tables summarizing papal reforms and documentary evidence up to the eighth century. Vogel (1986) has many useful tables showing the sources and their relationships.

Sacramentaries and Ordines give us glimpses of what the Roman liturgy was like in these centuries: although many were written for and used in Gaul and elsewhere, to some extent they represent Roman practice. The Sacramentary sent by Pope Hadrian I to Charlemagne between 784 and 791 is a book of masses celebrated by the pope in the Roman stationary liturgy: the Sacramentary of Padua represents the presbyteral use at Saint Peter's basilica c. 670—680. *Ordo Romanus I*, of the early eighth century, is our earliest direct evidence for the papal mass in Rome. Later Sacramentaries and Ordines—hybrids modified in Gaul and Germany, which were often disorganized and inconsistent—provided the basis for German books subsequently taken back to Rome. Some of the best evidence for what was performed in Rome before the Ottoman reforms comes from the so-called Old Roman sources. These are a small group of manuscripts dating from the eleventh to the thirteenth century that transmit Old Roman chant. The most likely explanation is that these sources represent the chant and texts sung in Rome up to the eleventh-century reforms: they lack the changes made by the Franks and transmit a more ornate form of chant. The current view is that they were written down as a result of pressures on the older rites caused by the Ottonian reforms. This Old Roman material was superseded, in the thirteenth century, by texts and chants organized and revised by the Franks and Germans—in musical terms this would be the chant often known as Gregorian chant.

The papal court was staffed by clerics who were preoccupied with administrative duties. The need for a liturgy less ornate than what had apparently been the case, and less ornate than what had come from the German pontificals, led to a thirteenth-century liturgy that was concise and brief. Under Pope Innocent III, papal and civil practices were reconciled and revisions of the mass and office for the papal chapel were undertaken. These revisions were carried out in close cooperation with the newly founded Franciscan order, and the missal and breviary prepared under Pope Honorius II (1216-1217) were officially adopted by

the order. A further revision undertaken by the Franciscan Haymo of Faversham (1240-1244) essentially made the use of the Franciscans and the Roman Curia identical. Innocent III was also responsible for a revision of the Pontifical, of which various recensions were produced up to the fourteenth century. This book, however, was gradually replaced by the Pontifical of William of Durandus, c. 1293-1295.

Churches in Rome were brought into line, and nonconforming manuscripts were destroyed (this may be one reason for the paucity of books other than those of the Roman Curia). Outside Rome, churches were not so quick to adopt the new use of the Roman Curia. The Lateran basilica retained its own practices until the fourteenth century. But eventually almost all the other uses in Italy came to conform with Roman-Franciscan Use, some more quickly than others. Even monastic orders adapted it. The Celestines, founded c. 1250, took Roman Use for the mass while following Monte Cassino for the monastic office. The Olivetans, founded in 1319 near Siena, adopted it, and after the reform at Saint Giustina's in Padua in the early fifteenth century, other monasteries such as Subiaco (and houses outside Italy in Austria and Bavaria) followed suit. Not until the mid-fifteenth century had most places in Italy conformed, and not until the advent of printing was it possible for the use to become a more or less universal rite.

Liturgical Developments outside Rome

Liturgical practices in other places in Italy, and their relationship to uses in Rome, are poorly documented. Aquileia was a patriarchate in the sixth and seventh century with two bishoprics, at Grado and Cividale. Traces of its earlier liturgy are very faint; it is said to be similar to that of Milan. One gradual thought to have been for the Aquileian rite has now been tentatively reassigned to Venice. Sources from the later Middle Ages seem indistinguishable from those elsewhere in Europe. The rite was suppressed in 1594-1595. Of the Ravennese rite even less survives: a noted breviary of c. 1100 (now at Downside Abbey) has distinct Ravennese connections but has been little explored. The really distinctive practices of this rite probably disappeared after 754, when Ravenna fell to the Frankish conquest of

northern Italy. Venice was formally subject to the eastern empire, and when the Franks failed to bring it into the western sphere its status became more independent (conflicts between the bishoprics of Aquileia allowed it to escape their domination, too). Soon after 810, a ducal chapel was built for the remains of the apostle Saint Mark, further enhancing the importance of Venice. This chapel became the private chapel of the doge. The rites were a mixture of ecclesiastical, political, and civil ceremonies, little known and, again, little explored. Discoveries made since about 1980 (reported by Cattin 1990-1992) may make it possible to reconstruct the liturgy of the later Middle Ages.

Of other places and institutions, little can be said. Verona was clearly a place where important liturgical sources were produced; Monza and Lucca were other centers from which books emanated, and the rites of Lucca are said to have influenced those of the papal curia. The use of the Sainte-Chapelle was ordained for Bari. Local cults, and especially local saints, were favored. Numerous houses flourished and probably had their own practices. In the late eleventh century and twelfth century, the Camaldolese had cloisters in Tuscany and Sardinia. The Vallombrosians were slightly more widespread in northern Italy. Irish foundations such as the one at Bobbio would no doubt have played some role in the distinctive liturgical life of the peninsula. Siena mixed civil and ecclesiastical ceremony in interesting ways.

Of the Ambrosian and Beneventan rites, however, we know more. Again, recent scholarship has focused on the edition and discussion of musical sources. The two rites were related politically and liturgically, and sometimes agree with each other against Rome; indeed, Beneventan practices were sometimes referred to as Ambrosian, as when Pope Stephen IX prohibited "Ambrosian" chant at Monte Cassino in 1058.

The Milanese rite, said to have been founded by Saint Ambrose (and thus called Ambrosian), was practiced in the archdiocese and has characteristics distinguishing it from Roman use. Similarities with Visigothic and Gallican uses have been suggested but are difficult to document; affinities with Byzantine liturgies have been discovered. Under threat from the Arians, Ambrose's church (according to Saint Augustine) sang "hymns and psalms . . . after the manner of oriental regions." Hymns were not a part of Roman use until the twelfth century

—they were, however, a part of the monastic liturgy, and the Milanese rite was influenced strongly by monastic forms. Ambrose said that he followed Roman practice closely, but there was more ceremonial, and a wealth of less formal services such as processions (called *psallendae*) and stational offices. The chant is generally more florid. Although the political importance of Milan allowed it to remain independent of Rome, eventually what was unique in the liturgy was suppressed (c. 1386) when the two ancient cathedrals were destroyed and their services were adapted for the new *duomo*.

The Beneventan rite was closely associated with the Lombard influence in the south, although liturgical and political relationships with Milan (also under Lombard rule) are clear. The surviving manuscripts are nearly all late (again perhaps as the result of a desire to preserve a declining rite): many *exultet* rolls, a good many books for the mass, and fewer for the offices. When later contaminating material is removed, they disclose a rite whose structure is quite similar to Roman, but in which familiar texts are distributed in quite different ways and used for different functions. For the expert, this characteristic and the use of non-biblical texts signal a Beneventan source, and quite distinct (often stereotyped and more ornamental) melodic characteristics signal Beneventan chant. The rite flourished most strongly in the eighth century, when Benevento became a principality, avoiding entanglements with popes, the Franks, and Byzantium. But by the ninth century increasing contact with Rome, and the growing importance of the Norman influence—especially at Monte Cassino—caused the rite to decline. By the eleventh century it had been suppressed.

A Note on Sources

Avast number of monographs, articles, and editions of particular genres exist for each of the major topics, but for very few of those topics is there any general overview of the liturgy in its historical, ecclesiastical, and political context. The bibliography below, necessarily selective, includes material contributing to a general picture. General information may also be found in various dictionaries; as of the present writing, the *Dictionary of the Middle Ages* is the most comprehensive and most

recent.

Liudprand of Cremona

Liudprand (Liutprand, Liuzo; c. 920–972) was bishop of Cremona (961-972) and also a historian and diplomat. He was born in Pavia in northern Italy into a wealthy family who may have been either merchants or urban aristocrats. His father (who died young) and stepfather had served Hugh of Arles, king of Italy, as diplomats. Liudprand himself went to Constantinople, capital of the Byzantine (eastern Roman) empire, in 949 during the reign of Constantine VII (called Porphyrogenitus) on a mission for Hugh's successor, Berengar of Ivrea. Liudprand fell out with Berengar and went into exile at the court of Otto I, duke of Saxony. There, Liudprand met Recemund, bishop of Elvira in Muslim Spain, who suggested that Liudprand write a history of their time. The result was *Antapodosis*. Liudprand rose in Otto's favor, was granted the see of Cremona, and accompanied Otto on an

expedition to Italy that resulted in Otto's coronation as emperor in February 962. Liudprand went on at least two missions to Constantinople on behalf of Otto: in 960 (when he seems not to have reached Constantinople); and in 968-969, during the reign of Nicephorus II Phocas, to arrange a marriage with a Byzantine princess for Otto's son, Otto II. The second embassy was a miserable failure, but later Nicephorus's successor, John I Tzimiskes, did consent to a match between Otto II and Theophano. Liudprand probably went to Constantinople a fourth time in 972 (though he seems to have been reluctant to do so, possibly because of ill health) to help escort Theophano to the west; and apparently he died at some point during that trip.

Liudprand's principal works are *Antapodosis* (translated into English as *Tit for Tat* or *The Book of Retribution*); *Relatio de legatio Constantinopolitana* (*Report on the Embassy to Constantinople*), i.e., the embassy of 968–969; and *Liber de rebus gestibus Ottonis* (*The Deeds of Otto*), i.e., Otto I. Recent scholarship (Bischoff 1984) has also identified Liudprand as author of a sermon given at Easter c. 960.

Antapodosis is a gossipy history running from 887 to 949. It forms our principal guide to northern and central Italy during that confused period and contains much information on other areas: Germany, Burgundy, southern Italy, and the Byzantine empire—especially Constantinople. *Antapodosis* was written to show that the major figures in Italian politics of the first half of the tenth century whom Liudprand disliked—notably Berengar of Ivrea and his wife, Willa—eventually met bad ends. Though an excellent storyteller, Liudprand obviously does not pretend to be impartial.

Relatio is bitterly anti-Byzantine. It is often cited to show the growing estrangement of the Latin west from Byzantium but in fact demonstrates no such thing. Liudprand's tirades against the "Greeks" are a result of the hostile and demeaning treatment he received at the hands of Emperor Nicephorus. There is no trace of anti-Greek sentiment in *Antapodosis*, which gives a good-natured account of Liudprand's mission of 949. The fascinating narrative and Liudprand's caustic humor compensate for the whining tone of *Relatio*.

The Deeds of Otto is a record not of the great Saxon ruler's entire reign (Liudprand died a year before Otto), but of one incident: the

deposition of Pope John XII by Otto in 963.

Despite his admiration for and devotion to Otto and the Saxons, Liudprand is a figure essentially centered on the Mediterranean. He claimed to know Greek and interlarded his work with Greek words (followed by their Latin translations). Although some scholars consider this merely a display of pedantry, most now believe that Liudprand did know the spoken Byzantine tongue of his day (which was closer to modern than to classical Greek), and perhaps some classical or *koine* Greek as well. Although Liudprand had the requisite education and social background for a diplomat, his effectiveness was vitiated by his explosive temper (amply demonstrated in *Legatio*) and his acerbic disposition (of which *Antapodosis* is a prime example). His urbane, witty, sarcastic, and occasionally ribald style makes him sound curiously modern, especially if one reads him in a good translation.

Liutprand

Liutprand (d. 744, r. 712-744) was a king of the Lombards. In 712, after having spent nearly ten years in exile from the Lombard court, Liutprand and his father Ansprand returned to Italy with backing from the Bavarians and overthrew Aripert II. Ansprand became king, but his death a few months later allowed Liutprand to claim the kingship. Liutprand then ruled until his own death.

Liutprand was the most successful of the Lombard kings. Although he had to spend the first part of his reign quelling internal resistance, he did succeed in bringing the rebellious dukes under control—a control that was even extended to the duchies of Spoleto and Benevento, which were traditionally virtually independent of the Lombard monarchy.

As king, Liutprand followed a policy of expanding his territory at the expense of imperial territory—and in opposition to the wishes of the papacy. The opportunity was provided by a growing rift between the

empire and the popes that was due partly to the Byzantines' weakness and partly to the Iconoclastic controversy. The refusal of the papacy to accept Iconoclasm was related to its slowly developing policy of freeing itself from imperial control and stepping into the political role of the empire in northern and central Italy.

Liutprand also continued the work of the earlier Lombard kings, Rothari and Grimoald, regarding legislation. During his reign he would add 153 laws to the Lombard code; these laws—which reflected an increasing influence of Roman law—emphasized the role of the state, modified inheritance practices, and recognized the validity of written testaments. With Liutprand, Lombard law began to lose many of its customary legal features and became a sophisticated social instrument.

During his later years, Liutprand associated himself in government with a nephew, Hildeprand, who succeeded him. However, Hildeprand was almost immediately overthrown by Ratchis of Friuli.

Livy

Titus Livy (59 B.C.-A.D. 17) was born in Padua. As a young man, he went to Rome, where he studied philosophy; at age thirty, he turned to

historical pursuits. He was publicly honored and respected during his lifetime, and he encouraged the historical studies of Claudius, the future emperor.

Livy, *Ab urbe condita*. Lyon: Apud Antonium Vincentium, 1553. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Livy's lifework is *Ab urbe condita libri*, a history of Rome from its foundation to Livy's own time. The work has an annalistic structure,

recounting the salient events in Roman history year by year. The history originally comprised 142 books, of which only 1 – 10 and 21–45 survive. The first ten books, called the "first decade," move from the mythic tale of Aeneas's flight from Troy to the third Samnite war (289 B.C.). Books 21–45—the third, fourth, and first half of the fifth decades—narrate Roman history from the second Punic war (218 B.C.) to the end of the war with Macedonia (167 B.C.). Other passages from the work are preserved in fragments and excerpts.

The loss of the bulk of Livy's work can be attributed both to its enormous size and to its subdivision into discrete sections of ten books each. These sections, the decades, were each transmitted separately, and no attempt to unite them was made until Petrarch's day. Also, although Livy's history was well-liked during his lifetime, Livy was not a standard school author during the Middle Ages, and the decline in his popularity contributed to the spotty transmission of his work. By the end of the ninth century there were only a few extant copies of the work. By the twelfth century there appears to have been a slightly greater circulation of parts of the history, and by the fourteenth century Livy's popularity surged, but the fourth decade remained extremely rare.

Dante demonstrates only a slight acquaintance with Livy, citing him merely in general terms. However, Livy stands as an authority on Roman history for Dante, who explicitly acknowledges his stature in *Monarchia* (2.3.6) and again in *Inferno* (28.12), describing him as *Livio . . . che non erra* ("Livy who does not err").

Boccaccio was apparently familiar with Livy and may have prepared an extant Italian translation of the third and fourth decades that contributed to Livy's renewed popularity. It was Petrarch, however, who played the pivotal role in the preservation of the remaining books of Livy's history. Petrarch found manuscripts of the first, third, and fourth decades at Chartres; put together two separate textual traditions; emended and annotated the text in his own hand; and, for the first time since antiquity, put the thirty books together. (Books 41–45 were not found until 1527.) Petrarch placed Livy at the top of his list of favorite historians and used some episodes from Livy's history as the inspiration for sections of his own *Africa*. Thanks in part to Petrarch's philological intervention, Livy became an important source in the Italian

Renaissance and a model for humanist historiography.

Lodi

The Lombard city of Lodi was founded in 89 B.C. as a Roman *municipium* with the name Laus Pompeia (Lodivecchio, west of the present Lodi, in the province of Milan) at the intersection of the Vercelli-Brescia and Milan-Cremona roads. The first documented bishop, Bassianus, was a contemporary of Saint Ambrose (339-397). The history of Lodi remains obscure for the Lombard and Frankish periods but becomes clearer after the year 1000. Lodi controlled the roads that connected Milan (Lombardy's major city) with Piacenza and Cremona and the lower course of the Lambro, by which the Milanese shipping traffic gained access to the Po. Lodi's important position in the transportation network of central Lombardy made the city an object of expansion efforts by the Milanese. In 1025 the German emperor Conrad II granted the archbishop of Milan the right of investiture for the bishop of Lodi. Just two years later, war broke out between Lodi and Milan when the archbishop attempted to make a Milanese cleric bishop of Lodi. Although it was set off by the archbishop's choice, this conflict may have resulted from a larger structural problem that became clearer as time passed. The archbishop's vassals acquired ever greater property in the territory of the Lodi diocese and thereby gradually revoked the right to legal and military access to these areas that the population of Lodi had enjoyed. The area along the lower course of the Lambro demonstrates the influence of such property transfers on Lodi's control of its *contado* (countryside) during the communal era.

During the Gregorian reform of the eleventh century, Lodi's clerics

remained skeptical of efforts by the papacy to renew religious life. Bishop Obizo (r. 1059–1083), however, seems to have been induced to join the reformers; thus, in 1093, the city formed a coalition with Milan, Piacenza, Cremona, and Matilda of Canossa to fight against Emperor Henry IV on the side of Henry's son Conrad. This coalition failed to protect Lodi from being destroyed in 1111 following a four-year war with Milan. Lodi's defeat resulted principally from the fact that a section of the nobility (*capitani*) and the bishop had joined the side of the Milanese. The victors demolished the city fortifications, drove the people into six unfortified villages (*borghi*), and cut off the transportation and trade opportunities of their conquered rival. Despite these efforts, the market of the largest village, Borgo Piacentino, soon regained its importance in the region. Concurrently, the inhabitants organized themselves into a commune, whose consuls are first mentioned in 1142. Although the city was able to regain a certain degree of independence, it remained influenced by Milan and had to provide both funding and troops for the campaigns of the Milanese against neighboring cities. In the early years of his reign, Emperor Frederick I Barbarossa attempted to strengthen his claim to the Po valley. This policy raised hopes in Lodi that the emperor would help it achieve emancipation from the dominance of Milan. Similarly, from the emperor's perspective, Milan threatened his authority because it ruled the neighboring cities of Lodi, Tortona, and Como. Detailed information for these critical years in Lodi's history is found in the chronicle of Otto Morena and his successors. In the growing conflict between Frederick Barbarossa and Milan, Lodi increasingly allied itself with the emperor. In response, the Milanese exerted pressure on Lodi through higher taxes and oaths of allegiance before finally destroying it in 1158. This event brought an end to Lodi in its original location.

Shortly thereafter, Frederick Barbarossa established a new city, Lodi Nuovo, 31/2 miles (about 6 kilometers) east of its earlier site, on the banks of the Adda River. The new location allowed the city to be more easily fortified by a wall, which was begun in 1160. To maintain Lodi's integral place in the transportation network of Lombardy, the road from Milan to Piacenza was diverted through Lodi Nuovo. Lodi's situation on a navigable river flowing directly into the Po gave the city an attractive harbor. In addition, the city served as an important

Lombard base for Frederick Barbarossa during the siege and destruction of the cities of Crema and Milan, and as an administrative center until his imperial organization collapsed in 1167. An imperial palace was built there, and in 1161 the antipope Victor IV held a synod there. The new city's religious and social continuity with Lodivecchio is indicated by the composition of the city magistrates and by the transfer of Saint Bassianus's relics to Lodi Nuovo in 1163. The empire's increasing exploitation of the Lombards provoked resistance, and in 1167 the *Lega Lombarda*, or Lombard League, a coalition of Lombard cities, was founded. After the rebuilding of Milan, the coalition forced Lodi to join it because, as an imperial fortress, the city threatened its supply line. Lodi, for its part, wanted to protect itself against expansion by the Milanese, and so it obtained contractual guarantees of its status as an independent city. The deposition of the earlier bishop who had been loyal to the emperor signaled a shift in the city's allegiance. Lodi remained on the side of the Lombard coalition until the peace of Constance in 1183.

In the 1180s, Frederick Barbarossa altered his alliances, ending his previous ties with Pavia and Cremona and establishing ties with Milan and Piacenza. These events brought Lodi under renewed and growing pressure from the Milanese until a peace treaty of 1198 granted it autonomy within the Milanese alliance system. At the turn of the thirteenth century, Lodi was governed by *apodestà*, and its communes began to codify the laws (*Statutes* and *Liber Iurium*). In the early thirteenth century, the Sommariva (backed by Milan) were opposed by the Ghibelline Over-naghi in the city's internal political parties. In 1237, during a war between the reactivated Lombard League and Emperor Frederick II, Lodi released itself from its alliance with Milan; it remained allied with Frederick II until his death in 1250. However, in 1251, under the leadership of the Vistarini family and with support from the Milanese, the Guelfs united against the Degli Averzaghi family. In the internal power struggle for control of Milan between the Delia Torre and Visconti families, the Delia Torre were banished from Milan, and Lodi became their base until 1295. At the beginning of the fourteenth century, Milan's domination of Lodi was briefly replaced by that of the *signorie* of the Vistarini and the papal legate Ismacoldo. In 1335, the city was integrated into the state of the Visconti. Only the

death of Gian Galeazzo Visconti in 1402 brought a short intermission in Milan's control of Lodi.

The old cathedral of San Bassiano of Lodi Vecchio survives. However, medieval traces are more visible in the new city. Remains from the medieval fortifications of the cathedral of San Bassiano and the churches of Sant'Agnese, San Francesco, and San Lorenzo, in addition to such secular buildings as the Broletto, Palazzo Vistarini, and Ospedale Maggiore, are still in evidence.

Lombard Law

Lombard law was introduced into Italy by the Lombards, a Germanic people who invaded the peninsula in 568 after the Byzantine-Gothic wars had brought the downfall of the Ostrogothic kingdom in 552. The previously unwritten laws of the Lombards were first codified by King Rothari in 643 in a law book known as *Rothair's Edict*, containing 388 titles. These laws were modified and supplemented by later Lombard kings, Grimoald issuing nine titles in 688; Liutprand, 153 titles between 713 and 735; Ratchis, fourteen titles in 745-746; and Aistulf, twenty-two titles in 750-755.

Lombard law never became the law of the entire Italian peninsula; it was confined to those portions under Lombard control: the main part of the kingdom centered in the Po valley (but not including the area around Ravenna and the Pentapolis), Friuli, and Tuscany. Farther south, the Lombards occupied the duchies of Spoleto and Benevento. Although at the height of their power in the mid-eighth century the Lombards held a good part of the Italian peninsula, they never effectively controlled Ravenna and a narrow strip of territory stretching toward Rome, the area immediately around Rome itself, or Naples and the southern extremities of the peninsula. In all these regions, Roman law remained in force—basically, the law of the western Roman empire (based on the Theodosian code and other pre-Justinianic writings) supplemented to varying degrees by Justinian's *Corpus iuris civilis*.

In the northern two-thirds of the Italian peninsula (to a line just south of Rome), Lombard law remained the law of the majority of the population following the overthrow of the Lombard kingdom by Charlemagne (a Frank) in 774. In this area (including the duchy of Spoleto, but not the other areas noted above), Lombard law remained dominant, but it was supplemented by a number of additional enactments or capitularies issued by the Carolingian and Italian kings of Italy (late eighth century to the tenth century) and the early German Roman emperors (late tenth century and early eleventh). Farther to the south in the duchy of Benevento, the original Lombard law remained in force but was supplemented by additional titles issued by the Beneventan princes Arichis and Adelchis in 774 and 866. Thus, from the

late eighth century on, there were two slightly different versions of Lombard law in use in Italy.

The relationship between Lombard law and Roman law has aroused much controversy. *Rothair's Edict* is usually regarded as a compilation of nearly pure Germanic custom, and the influence of Roman law is held to have become stronger in the work of Liutprand and his successors. But although much of *Rothair's Edict* is basically Germanic, it is not without Roman influence. The desire to produce a written book of law (which the royal justices could consult in the course of their work) and even the emperor-like act of issuing laws were largely a product of Roman influence, and the Lombard kings employed notaries who were Roman or had been trained by Romans (the language of the laws is Latin).

The Lombard laws constitute one of the most important of the "barbarian" codes. *Rothair's Edict* is itself a more comprehensive code than any of the others except the Visigothic. It covers many categories of matters about which legal dispute might arise: personal offenses, damages to property, theft, marriage, inheritance, and public offenses such as breaking the peace. Such organized coverage reflects some influence of Roman law, although the actual content of the law (except in some areas—such as debts and contracts, transfers of land, and the use of written instruments—where there is Roman influence) is basically Germanic. The structure of the Lombard court was Roman (with a royal justice hearing the suit and announcing the verdict); but other procedure was basically Germanic, since the injured individual or his family was responsible for bringing the suit before the court, and there was still some recourse to self-help—although the laws specifically denied recourse to the blood feud if one had accepted the compensation provided by law. The methods of proof were also Germanic, based mainly on the use of compurgation, but occasionally involving trial by battle.

The later Lombard laws were issued in order to interpret or modify the provisions of *Rothair's Edict*, or in response to actual cases that had come before the courts. There is thus ample evidence that, for the Lombards, law was more than unchangeable custom and the king was the source not only of justice, but also of new law. In all these respects, the Lombards reflect the advanced legal culture of those among whom

they settled and were ahead of the other Germanic barbarians (except perhaps the Visigoths).

The native Lombard laws and most of the Carolingian capitularies for Italy were issued from the capital city of Pavia, which early on became a center of culture and learning. Pavia remained a center of learning under the Carolingians, and—as the favored capital of the Carolingian and Italian kings of Italy—it retained its position as an important administrative and judicial center, just when, if ever, a "law school" was established at Pavia is unknown, but there is ample evidence of legal activity there from the large numbers of surviving charters that were issued at Pavia and from the *placita* or *notitiae* that record judicial activities in the palace there. By the late tenth century, this legal activity took on greater intensity with the appearance of a number of new texts. One of the most important of these was *Liber Legis Langobardorum* (also known as *Liber Papiensis*), which brought together the issues of the various Lombard kings and later Carolingian capitularies for Italy in a single organized text. By the early eleventh century, further work by the Pavian jurists had led to the development of two schools of legal thought: the *antiqui*, who favored a literal reading of the Lombard laws; and the *moderni*, who defended a more liberal interpretation of the laws and, where the Lombard law was silent or unclear, looked to Roman law for guidance. It is clear, then, that by the early to middle eleventh century, the Lombard jurists at Pavia were studying a form of Roman law.

Lombard law, interpreted by reference to Roman law, continued to be taught at Pavia, but increasingly the Lombard jurists at Pavia were challenged by masters teaching at Bologna. Evidently, it was at Bologna during the late eleventh and early twelfth centuries that specialization set in: Lombard, Roman, and even canon law were established there as separate bodies of law. As the influence of Bologna spread, and because this influence was based on the teaching of Roman law, the teaching of Lombard law eventually declined and Roman law predominated.

Lombard Leagues

Lombard League (*Societas Lombardiae*) is a label for any of several military and diplomatic alliances of northern Italian communes, confederated in 1164-1183 and 1226-1250 for the purpose of protecting their liberties in the face of threats—perceived or real—from their overlord, the Holy Roman emperor.

The earliest leagues developed in the wake of Frederick I Barbarossa's reduction of Milan in 1162. He left both friendly and hostile cities with imperial *podestà*—often Germans—who supplanted the consuls of the communal governments and often acted harshly, imposing high taxes, forced labor, and confiscations. The initial coalition of Padua, Treviso, Verona, and Vicenza was directed by Venice with the blessing of the Byzantines and the papacy. Pope Alexander III, whose legitimacy was not recognized by Frederick, was especially anxious to create and support an effective counterweight against imperial threats to his rule. In late 1166, Frederick returned to Italy; and on his march to Rome, where he intended to unseat Alexander, his armies ravaged the hinterlands of several city-states, thus drawing a second coalition—of Cremona, Bergamo, Mantua, and Brescia—into alliance with the earlier one. These were joined in April 1167 by Milan, at the League's first congress at Bergamo, where the coalition was given form and oaths of allegiance were sworn by the civic representatives (rectors). Bologna, Ferrara, Modena, Parma, and Piacenza joined later that year, and Lodi

was forcibly enlisted. Como, Novara, Tortona, and the Romagna cities of Forlì, Imola, Ravenna, and Rimini joined after Frederick's ignominious retreat to Germany in the spring of 1168.

League members recognized their place in the empire, but organized to protect their liberties and restrict their obligations to levels traditionally applied under earlier emperors. Their alliance was for fifty years, and no member was to accept a separate peace. Intercity fighting was banned, and people sympathetic to the empire in the cities were to be stripped of property and exiled. At its height, the League bound thirty-six cities and controlled Italy from Turin to the Adriatic. Members even built the new town of Alessandria, named for their pope and patron.

Frederick's campaign, begun in late 1174, splintered the coalition as it successfully disengaged Como, Piedmont, and the Romagna, but the League's great victory in 1176 at Legnano, near Milan, shattered Frederick's hopes and led him to a reconciliation with the pope and separate arrangements with Milan, Cremona, and Tortona. With the truce of Venice (August 1177), Frederick formally recognized Alexander and the League and granted amnesty for past resistance. In the absence of any galvanizing imperial threat, the cities reactivated their old rivalries, and the League dissolved with the peace of Constance in 1183.

Minor revivals of the League occurred in 1185 and against Henry VT in 1195, and vague fears of Frederick II induced a full-scale rebirth in Mantua in 1226. Alessandria, Bergamo, Bologna, Brescia, Crema, Faenza, Ferrara, Lodi, Mantua, Milan, Piacenza, Turin, Vercelli, the count of Biandrate, and the marquis of Montferrat sought aggressively to block imperial access to Italy and isolate the allies of the empire in Italy. This League was under both an imperial ban and a papal interdict, but it rarely transcended the members' own local rivalries. A military alliance between Ezzelino da Romano and Frederick revived the flagging coalition and led to the major imperial victory at Cortenuova (27 November 1237). Never accepting defeat, the League continued to spar with Frederick until his death in 1250. In the course of defying imperial power, however, many city-states accepted the rule of powerful and effective despots, and the continuous friction between Gueif and Ghibelline heated intracity factionalism and intercity warfare.

Lombards

The Lombards were a Germanic people who moved into Italy in 568. In the late first century, Tacitus reported them as living in the area of the lower Elbe River; but over the centuries they drifted southward, and settled in Pannonia in the early sixth century. Throughout this early period, the Lombards were very much part of a world where Roman interests were involved, and their institutions had undoubtedly been influenced as a result. For example, the Lombards had come into contact with Christianity, and at least some of them were Catholic in the mid-sixth century, although Lombard leadership was Arian at the time of the Italian invasion; however, many Lombards probably remained heathen. Although most of the Lombards had become Catholic by the third quarter of the seventh century, religion seems never to have been a major factor in their political experience. Also as a result of contacts with the empire, some Lombards came to know Italy in the later stages of the Byzantine-Gothic wars through service in one of the mercenary units of the Byzantine army.

Lombard tradition traced the kingship back to a legendary past (as we know from the work of the eighth-century Lombard historian Paul the Deacon); but although many of their early kings had ties to a single family, the Lombards had not developed a fixed rule of hereditary succession—and they did not develop one in Italy. Alboin, son of Audoin, was the king who led the Lombards across the Julian Alps into northeastern Italy, where the first of the Lombard duchies, Friuli, was established and was bestowed on Gisulf (a nephew of Alboin's), who remained behind with chosen groups (*fame*) while the remainder of the Lombards continued west and south under Aiboin. Conquest was relatively easy. The long, drawn-out Byzantine-Gothic wars had devastated Italy, the new Byzantine rule with its heavy fiscal exactions was not loved, and the Byzantines' military attention had been diverted by threats from the east.

The main Lombard settlements were in Friuli and Trent, the Po valley (Pavia became the usual Lombard capital), western Emilia, and Tuscany; but perhaps as early as 571, splinter groups had pushed on southward and established the duchies of Spoleto (under Duke Faroald)

and Benevento (under Duke Zotto). At the height of the Lombards' power (under King Liutprand, 712-744), a large part of the Italian peninsula (including Spoleto and Benevento) was under their direct control; but some parts of Italy always remained separate, under actual or nominal control by the Byzantines: Istria, the area around Ravenna and the Pentapolis, a strip of territory running southward from Ravenna toward and spreading out in the vicinity of the city of Rome, Naples and its territory, and the southernmost parts of the peninsula. The boundaries of all these regions shifted frequently as royal, ducal, imperial, and papal power waxed and waned. The situation was always unstable (one factor in this instability was the frequently elective nature of the Lombard kingship), and in the end it defeated the attempts of the Lombard rulers to unify the peninsula.

Despite this weakness, the Lombards established one of the most important of the "barbarian" kingdoms. They had the advantage, of course, of settling in Italy, which had been the heart of the western Roman empire. It is very hard to gauge the exact nature of this advantage, however, for it is impossible to know just how much of the Roman administrative structure remained through the turbulent last years of the Ostrogothic kingdom. At one time it was assumed that the Lombards were actually barbarous and had destroyed all traces of Roman institutions and freedom, but it is now apparent that no such thing happened—the charges against the Lombards were largely a result of the political hostility of the papacy. Roman city life survived under the Lombards, as did a class of Roman landholders, although the aristocracy seems to have been largely Lombard.

The Lombards' respect for things Roman is demonstrated principally by the most important written records left by a number of the Lombard kings (Rothari, Grimoald, Liutprand, Ratchis, and Aistulf): the Lombard laws. Roman influence is reflected in the act of royal legislation as well as in the acceptance of such Roman concepts as contracts, land transfers, and testaments, and the use of the Latin language. The Lombard laws also make it clear that persons of Roman descent enjoyed peace and security in the Lombard kingdom, as well as the right to continue to use Roman law (although we do not know just how Roman law was administered in the Lombard portions of Italy).

The Lombard court at Pavia became a center of legal as well as

cultural activity. As early as the reign of Agilulf (590-616), Secundus of Nun from Trent resided at court and composed a chronicle history (now lost) of the Lombards. The laws were issued from Pavia, and in the mid-eighth century the historian Paul the Deacon lived at court there before moving to Benevento with his patroness, Adelperga (a daughter of the Lombard king Desiderius), whose husband had been appointed the new duke of Benevento. Although Pavia remained the capital of Lombard Italy after the Carolingian conquest in 774 and charters and court records dated from Pavia indicate a continued high level of education there, the court at Benevento in many ways succeeded to the cultural leadership of Italy in the late eighth and ninth centuries. The princes of Benevento retained the use of Lombard law and added to it on several occasions, developed an elaborate court ceremonial (influenced by Byzantine practice), provided for the construction of a number of important sacred buildings (also heavily influenced by Byzantium), and sponsored a *scriptorium* that produced the beautiful Beneventan script.

The Lombards' political domination would give way in northern and central Italy during the late eighth century and would gradually disintegrate in the south during the tenth century, but the Lombards left behind a priceless legal heritage, as well as the most urbanized geographic landscape in western Europe. In the cultural realm, they left a number of architectural monuments (few of which now survive) as well as educational centers in cities such as Pavia and Benevento, and in monasteries such as Nonantola and Monte Cassino.

Lorenzetti, Pietro and Ambrogio

The brothers Pietro Lorenzetti (c. 1280-1348) and Ambrogio Lorenzetti (c. 1290-1348) were Sieneſe painters; they represent two of the most radical and innovative forces in *Trecento* art. Pietro and Lorenzetti were probably pupils of Duccio, and they both enlarged on the study of narrative and pictorial realism common to Sieneſe and Florentine art at this time. Their art manifests an interesting admixture of the styles of both schools, combining Sieneſe sensitivity to color and line with Florentine monumentality.

Relatively few documents regarding the life or artistic activity of either Pietro or Ambrogio have come down to us. Although Lorenzo Ghiberti, in the first written account of Ambrogio, provides a long and enthusiastic discussion of his work (*Commentarii*, c. 1450), he never mentions Pietro in his survey of Sieneſe artists. Vasari (*Lives*, 1568) did not even realize that the two artists were brothers; he misidentified one of them as Pietro Laurati. Reconstruction of their careers has understandably proved to be difficult, especially because some of their most celebrated compositions have been lost. Although the brothers worked quite independently of each another, some commissions appear to have been joint undertakings, and the intensity of each brother's exploration of pictorial realism suggests a greater degree of contact and collaboration between the two than we now suppose.

Pietro, traditionally considered the elder brother, has usually been overlooked in comparison with Ambrogio, who has a greater reputation for invention. However, Pietro's own brilliant technical innovation is shown as early as his first documented work, a polyptych painted for the high altar of the parish church of Santa Maria in Arezzo (1320). In

one portion of the *Arezzo Polyptych*, the frame is treated as if it were contiguous with the architecture of the painted narrative, so that the pilasters and arches framing the *Annunciation* are seen as supporting elements for the front wall of Mary's chamber. The space of this room is seen logically as extending back from the supporting columns and arches on the surface, creating an illusion of a box of space extending beyond the frame. This was an advance in a direct line with the development of one-point perspective a century later, and it was an idea to which Pietro would subsequently return even more daringly. Analysis of Pietro's forms in the *Arezzo Polyptych* reveals a melange of stylistic sources influencing his art. In the central panel of the *Madonna and Child* especially, the Madonna exhibits a graceful sway and pattern indebted to Duccio; the pronounced twist of her neck recalls Giovanni Pisano's sculptures for the facade of the cathedral in Siena; and her firm support of the child's solidly rounded body echoes Giotto's massive forms.

Important pictorial features are found in Pietro's most extensive surviving work, the frescoes in the left transept of the lower basilica of San Francesco in Assisi. These narrate the *Passion and Resurrection of Christ* and the *Stigmatization of Saint Francis*; and there is an unusual section of trompe l'oeil depictions of chapel furnishings, including an unoccupied pew, a Active altarpiece, and a niche containing liturgical objects. These frescoes are undocumented, and their dating has provoked controversy, but most scholars place them c. 1320. Many scenes, such as the *Entry into Jerusalem* and the epic *Crucifixion*, continue the Sienese tradition of sensitivity to color and love of profusion, but they are characterized by an unprecedented wealth of observation. The *Last Supper*, for example, deftly juxtaposes three distinct types of light in a confrontation of the mundane and the divine. A remarkably detailed night sky, the first portrayal of its kind, meticulously differentiates the light of the moon, stars, and meteors streaking across the heavens above the structure containing the main scene. This natural light is contrasted with the artificial light of the hearth fire in the kitchen, which casts the first shadows in western art since antiquity. Both of these lights pale in relation to the floodlit interior of the supper chamber, which seems to be illuminated by the supernatural glory of Christ and his disciples. In another astonishing

step toward realism, Pietro makes it clear that the narratives are to be understood as a sequence of stories unfolding over time; the moon, high over the pavilion in the *Last Supper*, is shown to be setting behind the Mount of Olives in the adjacent *Arrest of Christ*. Other frescoes in the left transept, such as the *Deposition from the Cross* and the *Entombment*, do away with all anecdotal detail to approach the monumental grandeur and dramatic tension of Giotto's narratives. The *Deposition*, in which Christ's broken body is ingeniously interlaced with the living, forms one of the most sustained images of grief in western art.

Three securely dated works succeeded the Assisi frescoes: the *Carmine Altarpiece* of 1327-1329 (Siena, Pinacoteca; New Haven, Yale Museum; Princeton, Princeton Museum), a polyptych made to celebrate the final approval of the Carmelite order by Pope John XXIII in 1326 for its Sienese church of San Nicolo; the *Uffizi Madonna and Child* (Florence, Uffizi; signed and dated 1340); and the *Birth of the Virgin* (Siena, Museo dell'Opera Metropolitana; commissioned 1335, signed and dated 1342). This last altarpiece, made as part of a cycle of Marian altarpieces celebrating feasts of the Virgin surrounding Duccio's *Maestà* in the cathedral of Siena, returns to the integration of frame and painting seen in the *Arezzo Polyptych* of twenty two years earlier. Here the illusion of continuity is much more thorough. We seem to be peering into a miniature Gothic palace which is structurally supported by the columns and arches of the frame and from which the exterior walls have been removed (as in a dollhouse) to allow us to witness the events within. And although this work is technically a polyptych (the two lateral panels of saints originally flanking the *Birth* are now lost), there is none of compartmentalization traditionally seen in separate panels. The space of one panel is treated as continuous with that of the next; thus, the two panels on the right convey information concerning the same time and place, Mary's birthing chamber. To emphasize this, the figure of the woman bearing a fly whisk continues on either side of the vertical pier of the frame. Also gone is the traditional flattening backdrop of gold leaf signifying a sacred event. Instead, an opulently appointed interior, described in rich patterns from the vault to the floor tiles, defines a remarkably convincing illusion of spatial recession. In the left panel depicting Joachim and the herald, the setting suggests a

vast structure beyond the two visible chambers, indicating Pietro's concern to construct a completely plausible world for his figures to inhabit.

Ambrogio Lorenzetti (fl. c. 1311-1348), *Allegory of Good Government*. Fresco. Palazzo Pubblico, Siena. Photo: © Scala/ Art Resource, N.Y.

Pietro worked, together with Ambrogio and Simone Martini, on a cycle of frescoes illustrating the life of the Virgin for the facade of the hospital of Santa Maria della Scala in Siena. (These frescoes are now lost, but a recorded inscription bore the date 1335.) Pietro also worked alongside Ambrogio on a fresco cycle for the chapter hall of the monastery of San Francesco in Siena, of which a *Crucifixion* and a *Resurrected Christ* survive (possibly 1336). A *Massacre of the Innocents* from a fresco cycle in San Clemente ai Servi in Siena and an altarpiece depicting stories of the *Life of the Blessed Humilitas* (Florence, Uffizi) are two other works frequently attributed to Pietro.

Lorenzo Ghiberti considered Ambrogio Lorenzetti the greatest Siennese painter of the 1300s, surpassing even Simone Martini in ability and sophistication. A *Madonna and Child* from Vico Labate (signed and dated 1319; Florence, Museo Arcivescovile del Cestello) is the earliest of only three dated works by Ambrogio. It shows the originality

of the artist's concepts from the beginning of his career. Ambrogio's panel is based on a Byzantine type of the Virgin as the throne of God, and the rigidly frontal, iconic pose of the Madonna adheres closely to the archaic format. The sovereign detachment between mother and God, typically upright in front of the Madonna, has, however, here been replaced by a restless, squirming Christ child seeking his mother's attention. Both figures have the solidity and roundness of Giotto's paintings, and the throne is also presented as a spatially receding three-dimensional structure. This modernization of an ancient type in the latest Giottoesque idiom reveals Ambrogio's special understanding of the Florentines' achievement. In fact, Ambrogio worked periodically in Florence between 1318 and 1332, and he is listed in the registry of the Florentine painters guild in 1327. The Vico L'Abate panel is a prime example of the astonishing variety and inventiveness that both Pietro and Ambrogio brought to the theme of the Madonna and child. Both artists composed ceaseless variations on this popular devotional subject, but Ambrogio's Madonnas, especially, attained a level of iconographic and aesthetic sophistication that seems to belong more to the Renaissance, or even to the Baroque, than to the *Trecento*. A few of Ambrogio's groupings of the Madonna and child are shown as if responding to the viewer's presence, as in the *Madonna del Latte* (Siena, Palazzo Arcivescovile), in which the suckling child looks out at the viewer with intense curiosity; or the *Rapolano Madonna* (Siena, Pinacoteca), which portrays a Christ child so surprised and frightened by the attention coming from our direction that he crushes his pet goldfinch. This psychologizing of the mother's and the child's response to their surroundings reaches a climax in the Sant'Agostino *Maestà* in Siena (possibly 1339), the last surviving fragment of a fresco cycle illustrating episodes of the life of Saint Catherine of Alexandria for an Augustinian chapter house formerly adjacent to the church. The *Maestà* depicts Mary and Christ adored by saints who bear the attributes of their faith; these include some who were brutally martyred: Saint Bartholemew with his flayed skin, Saint Agatha with her breasts, and Saint Catherine with her severed head all kneel and present their tokens of faith to the child. This grisly spectacle strikes terror into the child, who staggers unsteadily backward in an attempt to escape—the most natural response a child could have.

Some of Ambrogio's patrons apparently felt that his daringly human interpretation of the divine breached the limits of decorum. The chapel of Monte Siepi in the rural abbey of San Galgano near Siena was built to honor this Siennese saint and to commemorate a vision of the Madonna that Galgano had on this site. The surviving frescoes are fragmentary; but Ambrogio's original program for the chapel, c. 1336, included a depiction of Galgano's vision, portraying a procession of saints and angels on the side walls converging, along with the visitors inside the chapel, toward the Madonna enthroned as queen of heaven on the wall behind the altar. By portraying saints on the walls flanking the enthroned Madonna, Ambrogio involved the entire space of the chapel, surrounding the viewer with Galgano's vision—a bold experiment that anticipates the carefully coordinated chapel interiors of the seventeenth century. The complex iconographic program for the wall portrayed the Virgin's central role in the mystery of human redemption: she was shown both as the exalted queen of heaven at the top of the fresco and as the humble *Virgin Annunciate* at the bottom. As the discovery (in 1996) of the *sinopie* underlying the frescoes revealed, Ambrogio originally portrayed the Virgin of the annunciation cowering in utter terror before the angel, while the *Maestà* above showed her enthroned without the child, wearing a crown, and bearing worldly symbols of power—the orb and scepter—in her hands. Both of these unique images were suppressed shortly after completion of the frescoes: the trembling annunciate was painted over by another artist, who replaced her with a typical meekly accepting Madonna; and the empress was transformed into the more usual image of motherhood by placing the Christ child on her lap. Presumably, the patrons had been disturbed by Ambrogio's provocative interpretations and had subsequently commissioned something more conventional.

From 1337 to 1340, under commission from Siena's ruling Council of Nine, Ambrogio worked on the most important surviving cycle of medieval secular decorations, the *Allegory and Effects of Good and Bad Government*, painted on three walls of the Sala della Pace (or Sala dei Nove), one of the ruling council's meeting rooms in the Palazzo Pubblico in Siena. This cycle is almost completely devoid of religious content; its complex philosophical underpinnings—along the lines of antique Aristotelian, Ciceronian, or more strictly medieval tracts—are

still disputed. We may take comfort in the fact that even during the *Trecento*, visitors to the *sala* needed the learned interpretation of a guide in order to understand the extremely intricate allegorical message of the cycle. The fresco juxtaposes the elements of just and harmonious rule with the evil elements of tyranny, contrasting the effects of each form of rule on city and country. The mural is filled with visual puns (Harmony, for instance, is shown with a wood plane, smoothing out any unevenness) and references to the antique (the figure of Peace is derived from an antique Roman coin). In his depiction of the prosperous city, Ambrogio created an unparalleled catalog of the myriad activities of town life. Nothing else in medieval art prepares us for the panoramic landscape adjacent to the well-governed city, which is the first landscape since antiquity, and really the first "portrait" of a particular terrain—a glance out the window of this hall reveals the close affinity between the fresco and the Tuscan countryside surrounding Siena.

As noted above, Ambrogio collaborated with Pietro on (lost) frescoes for a hospital in Siena, and on frescoes for a Franciscan chapter house (the latter included a painting of a typhoon, since lost, that Ghiberti praised highly). Ambrogio also painted an altarpiece of the *Presentation at the Temple and Purification of Mary* (1342; Florence, Uffizi) for the same cycle in the cathedral at Siena for which Pietro executed his *Birth of the Virgin*. Like Pietro's work, Ambrogio's *Presentation* is startling for its sophisticated suggestion of space and light. Ambrogio's last signed and dated work is from 1344: an *Annunciation* (Siena, Pinacoteca) painted for the chamber of the tax magistrate in the Palazzo Pubblico in Siena. The moment of incarnation depicted here presents an interpretation of great theological subtlety, and the spatial construction of the panel shows the tile floor converging to a single vanishing point; this is the closest any *Trecento* painting comes to true one-point perspective.

Ambrogio and Pietro both evidently died of the plague in 1348; with their deaths, Siena's period of cultural ascendancy came to an end.

Lorenzo Da Firenze

Lorenzo da Firenze (d. December 1372 or January 1373) was a member of the second generation of Italian *ars nova* musicians and a contemporary of Francesco Landini, Andrea da Firenze, and Paolo da Firenze. Lorenzo was said to have been a canon of the church of San Lorenzo from 1348 to his death. We know that he was active as a teacher, and it has even been suggested that Landini was his pupil.

Some of Lorenzo's reported music has been lost; his relatively small extant output is mostly in the celebrated Squarcialupi Codex, which includes his portrait. There are one or two movements of the Latin mass, while his Italian secular pieces include five monophonic *ballate*, ten two-voice madrigals, and one three-voice *caccia*. The texts he set were by a number of important contemporary poets, including Franco Sacchetti and Boccaccio (one *ballata* and one madrigal). Lorenzo was a progressive and even experimental composer. His monophonic style is highly florid and virtuosic. In his part-writing, he uses a good bit of imitation, and the influence of the French *ars nova* style is evident in his introduction of isorhythmic techniques and his considerable chromaticism. In all, he ranks after only Jacopo da Bologna and Landini in importance among the *Trecento* masters.

Loreto

Loreto is the site of the great shrine of the Virgin, traditionally identified as her house in Nazareth, the scene of the annunciation. Legend has it that the house was transported in a series of miraculous stages from Nazareth to Tersatto (near Fiume), to Recanati, and finally to its present location in the period 1291-1294. Little serious credence was given to the tradition until the sixteenth century, and the community developing around the shrine was not constituted as a city until 1586.

Lothar I

Lothar I (Lothair I, 795-855, r. 817-855) was the eldest son of Louis "the Pious" and Louis's wife Ermengarde, and the grandson of Charlemagne. Lothar was made coemperor with his father in 817 and was crowned by Pope Paschal I in April 823.

Lothar I spent much of his life in almost constant strife with his brother Louis and half brother Charles "the Bald," the son of Louis the Pious and Louis's second wife, Judith. In the Battle of Fontenoy (25 June 841), Lothar was defeated by his younger siblings. After prolonged negotiations, the three brothers signed a treaty at Verdun in August 843, dividing Charlemagne's old empire among themselves. Charles the Bald received the western portion, which would later become France. Louis's share was the eastern section of the empire. Some historians discern the beginnings of modern Germany here, but this is disputed. Lothar received a long strip of territory between the two and the title of

emperor. This strip of land, which included Burgundy and northern Italy, had neither geographical nor ethnic cohesion, and after Lothar I died it was subdivided among his sons. Lothar's oldest son, Louis II, received northern Italy and the imperial title.

Lothar I has not been treated kindly by modern historians, who have regarded him as an undependable opportunist.

Lothar II

Lothar (c. 920-950), the son of Hugh of Provence, was coruler of Italy with his father; but in 945 Hugh was overthrown by Berengar of Ivrea, grandson of the "emperor" Berengar. Hugh withdrew to his ancestral domains in Provence, leaving Lothar as nominal king of Italy. In fact, Lothar was a puppet of Berengar, who probably murdered him in 950. Lothar's chief importance is that he was the first husband of Adelaide of

Burgundy, who later married Otto I (in 951). Adelaide and Lothar had a daughter, Emma, who married the Carolingian Lothair of France.

Louis I the Pious

Louis I (778–840) succeeded his father, Charlemagne, as emperor in 814. During the first decade of his reign, Louis acted vigorously to give unity and cohesion to the somewhat ill-defined empire he had inherited. His program emphasized strengthening and purifying the church as the agency through which the Godordained emperor could shape the empire's diverse peoples into a unified society guided by Christian principles.

By the 820s, the thrust toward unity, increasingly dictated by aggressive clergymen, began to generate conflicts of interest. The focal point of discord was one of the key enactments of Louis's program of unification, the *ordinatio imperii* of 817, which provided that on Louis's death the office of emperor and lordship over the entire empire would go to his eldest son, Lothair, while his other sons, Pepin and Louis, would inherit small dependent subkingdoms in Aquitaine and Bavaria. The issue of the succession took on new complexity in 823, when a fourth son, Charles, was born to Louis and his second wife, Judith. At the urging of Judith and her supporters, Louis became ever more concerned with providing an inheritance for Charles, a policy that threatened the interests of his other sons as well as those dedicated to imperial unity.

These clashing interests turned the last years of Louis's reign into a series of crises, highlighted by revolts against him in 830 and 833 led by his elder sons. Although Louis survived these assaults, the issue of
